CAMPO, SAN DIEGO CO., CAL., July 3d, 1874.
MESSRS. DEWEY & Co.—Gentlemen: To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think it very good that you stand in their own light when they do not put their business into your hands. I remain yours truly,
A. M. GASS.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice upon individuals at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

Dolores Consolidated Mining Company.

Location of principal place of business, San Francisco, Cal. Location of works, Dolores Mining District, Esmeralda County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of February, A. D. 1877, an assessment, No. 1, of 10 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 418 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 1st day of March, A. D. 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 16th day of April, A. D. 1877, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

Office, Room No. 2, 418 California street, San Francisco, California.

Tuolumne Hydraulic Mining Company.

Principal place of business, city and county of San Francisco, State of California. Location of works, Tuolumne county, State of California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of January, 1877, an assessment of Five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin to the Secretary, at the office of the company, Room 2, 528 California street, San Francisco, Cal.

Any stock on which this assessment shall remain unpaid on the 12th day of March, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 26th day of April, 1877, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

Office, Room 2, 528 California street, San Francisco, California.

PACIFIC MACHINERY DEPOT,

H. P. GREGORY & Co., Nos. 14 & 16 First Street,

San Francisco, Cal.

P. O. Box 168.

Pure Oak Tanned Leather Belting,

Perin's French Band Saw Blades,

Planer Knives,

Nathan & Dreyfus' Glass Oilers, and Mill and Mining Supplies of all Kinds.

BLAKE'S PATENT STEAM PUMP.

Over 8,500 in Successful Use in the United States.

PICKERING ENGINE GOVERNOR.

VALLEJO FOUNDRY, October 17th, 1876.

Messrs. NEYLAN & YOUNG, San Francisco,

Agents for "PICKERING GOVERNORS."

Gentle:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this year for my patent Straw Burning Threshing Engines give splendid satisfaction. They far surpass for regularity of speed any Governor that I have ever seen, and I have seen all the best kinds: I have seen the main belt fly off the pulley several times this season while threshing, and the engineer did not discover it, so perfectly was the speed maintained, until he was told of it; this I consider something wonderful; I consider the Governor absolutely perfect, so far as speed is concerned. I bought and put on to one of my engines a Shive Governor, to see which was the best, and after one season's trial I have no hesitation in saying they are superior to any other Governor that I have seen or used. I wish you would send me the lowest price that you can furnish 25 Governors for next season's engines.

Yours respectfully,

J. L. HEALD.

The only Governor that has received awards at each of the International Exhibitions. American Institute Fair, New York, 1865, Two Medals; Mechanics' Institute Fair, Baltimore, 1865, Silver Medal; American Institute Fair, New York, 1869, Two Medals; International Exposition, Paris, 1867, One Bronze and Two Special Medals; International Exposition, Vienna, 1873, Medal of Progress and Decoration; International Exhibition, Philadelphia, 1876, Medal and Diploma.

CAMERON'S CELEBRATED STEAM PUMPS

For Feeding Boilers and Draining Mines. MACHINISTS' TOOLS AND WOOD WORKING MACHINERY.

NEYLAN & YOUNG, SOLE AGENTS FOR THE PACIFIC COAST, 18 and 20 Spear Street, S. F.

Hooker's Patent Direct Acting Steam Pump.

W. T. GARRATT,

Cor. Fremont & Natoma Streets, S. F.

SIMPLE, CHEAP AND DURABLE.

Adapted for all purposes for which Steam Pump are used.

The Best Pump in Use.

SEND FOR CIRCULAR.

N. B.—Also manufacturer of Hooker's Deep Well and Double-Acting Force Pump. Received the Silver Medal awarded at the last Mechanics' Fair in San Francisco.

PATENTED CAST STEEL SHOES AND DIES.

Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of iron from which our Steel is manufactured, and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at twelve cents per pound, delivered at San Francisco or Sacramento, instead of sixteen cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc., etc.

Address all orders, with dimensions or drawings, to

CAST STEEL SHOE & DIE CO.,

59 Nevada Block, S. F.

THE ASBESTOS PATENT FIBER COMPANY,

TWO MEDALS OF HONOR.

TWO CERTIFICATES OF THE HIGHEST MERIT.

Of Philadelphia, offer for sale through their agent in San Francisco,

Asbestos Steam Packing, Asbestos Boards and Asbestos Steam Joints,

All manufactured from the pure utilized Asbestos Patent Fiber, and under patents granted to J. S. Rosenthal. The packing is in all sizes from one-quarter to three inches in diameter, round, and free from all grit or mineral matter. The non-utilized or crude Asbestos, manufactured by some parties into packing, is impure and gritty, liable to injure the piston rod and should not be used. The packing made under the Rosenthal patents is of pure utilized Asbestos fiber, and a very superior article and entirely different from the so-called Asbestos packing heretofore offered for sale. It is compact in form, will not fuzz or disintegrate, and will wear much longer than any other kind of packing. The indestructible, expanding, contracting and lubricating qualities of Asbestos are now universally recognized, and packing made from it is peculiarly adapted for steam engines and pumps.

ASBESTOS PATENT FIBER BOARD.

This is the champion non-conductor, to prevent radiation of heat and condensation of steam, as covering for marine, stationary, or locomotive boilers and pipes, and for lining wood-work, where exposed to great heat. It is light, flexible, is not disturbed by vibration, and will not char or crumble. The sheets are 30 by 44 inches, of any desired thickness, and are easily applied.

ASBESTOS PATENT FIBER STEAM JOINTS.

Indestructible by fire or water, expands and contracts in a desirable manner, adjusts itself to any rough point, is cheaper than rubber, and in all respects a superior article. PURE ASBESTOS FIBER for packing steam governors and other purposes. All these goods are extensively used in the Atlantic States and give general satisfaction.

PHILIP HINKLE,

Also, For Sale by

DUNHAM, CARRIGAN & CO.,
107 & 111 Front Street.

SOLE AGENT FOR THE PACIFIC COAST,

118 & 120 Main Street, San Francisco,

At the Hydraulic Elevator Works.

GOLDEN STATE IRON WORKS, CO-OPERATIVE, FOUNDRY and MACHINE WORKS.

MINING AND MILLING MACHINERY OUR SPECIALTY.

GOLDEN STATE SUCTION AND PRESSURE BLOWER FOR VENTILATION OF MINES. BLAST OR EXHAUST FOR FURNACES OR REDUCTION WORKS.

They have no superior. The casing is made in sections, so as to be easily accessible. They run easily, not rapidly, and the perfect contact of wings gives a uniform and powerful blast.

Manufacturers of

IMPROVED PORTABLE

Hoisting Engines,

For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery.

“AMES” CELEBRATED PORTABLE & STATIONARY ENGINES.

This cut illustrates some of the important advantages of our “Portables.” As regularly made, the Engine may, at pleasure of owner, be used on top of Boiler, or detached from it, as shown in cut, thus combining the adaptability of either form for any location. It will be necessary to send us a sketch, showing relative position of Engine and Boiler, and their distance apart, when intended to be run “stationary,” in order to send with them suitable connecting pipes, which will be charged for according to extra quantity required over that furnished with the “Portables.”

The boilers are of the Locomotive Pattern, which requires no setting, and is made of such material and proportions, and so arranged as to insure safety, durability, and the greatest efficiency for the amount of fuel consumed.

The shell and tube sheets of boiler are of the best Pennsylvania iron, of proper thickness to secure strength, while we take extra precaution, at an increased expense, of making

the furnace of the best solid fire box plate, which has never heretofore been used in portables on account of its high price. We prefer, however, to make less money, and produce a really first-class article, safe and sure beyond peradventure, than to increase our profits by using cheaper material. The tube sheets are also selected from iron of proper strength and thickness, according to the diameter of the boiler. The Tubes are the best American lap-welded. Great care is taken in bracing the furnaces at the sides, as well as the top and bottom, in the manner adopted by the best locomotive builders.

We would call especial attention to the great improvement in the form of our Furnaces, obtained by extending around them a water space of ample size and curved form, its under side forming an ash pan, and allowing the water to circulate freely, thus preventing sediment from accumulating and adhering, as it does in the ordinary form of locomotive boilers, in that part of the furnace below the grate.

“Ames” Portable Engine and Boiler Erected as a “Stationary.”

The Engine is of the horizontal style, and is made with a bed plate, from entirely new and improved patterns, designed with a view to elegance, simplicity, convenience and strength. It is built entirely separate from and independent of the boiler, and can at any time be used as a stationary by obtaining the necessary additional length of steam and exhaust pipes. In our portables it is placed on the saddles on the top of the boiler, and secured with bolts.

Particular attention is paid to boring the Cylinder accurate and smooth, and to fitting the Piston and Valve. The Piston is of the most approved locomotive pattern, fitted with metallic packing rings, which are adjusted by steel springs of proper proportion, regarding tension, elasticity and strength.

The Slide Valve and its face are made perfectly true and steam tight, and it is constructed with the proper amount of lap to develop the most approved data of expansion that has been proved by numerous experiments to point the correct working of the engine, in relation to the use of steam, with greatest economy and efficiency.

This cut, taken from the “pump side” of No. 2 Ames Portable Engine, gives a good idea of the appearance of the sizes from five to 20-horse power. Trusting that it will convey a favorable impression as to the style of our engines, we would say as to material, that we use only the best; as to workmanship, that we do not claim any extra polish for external show, but do claim accurate and fine finish to all the working or wearing parts; we also claim that the boiler, steam and exhaust passages, and other vital points, are scientifically proportioned in accordance with the best experience and the use of the Steam Engine Indicator; also, that as we make a specialty of Portable Engines, we can sell a better and larger engine

for less money than those who do not confine themselves to any particular article of manufacture. We will not attempt in this space to enumerate the uses to which our engines have been applied, but assert that no engine surpasses them in adaptability to any work or location.

TULLOCH'S AUTOMATIC ORE FEEDER,

Awarded the Centennial Medal.

The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of the parties certifying to those herewith given, will establish their value and genuineness:

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone \$48 a day. Mr. Green, of the Phoenix mill (12), Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use 14 months; you need fear no competition on wet ore. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Stripe companies, Plumas county, writes: From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage them; the saving in both labor and castings is fully one-half over the old style of feeding by hand. Mr. Preston writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

VOLUME XXXIV.
Number 9.

Ancient Ruins.

In the extreme southwestern corner of Colorado Territory, west of the one hundred and eighth meridian are numerous groups of old ruined houses and towers, proving that in former times a more civilized and intelligent race lived there than at present. Mr. W. H. Jackson, who accompanied the Hayden survey, wrote a paper on the subject of these towns, describing them in detail. Ruins of a similar character are said to exist along the Rio Las Animas and San Juan, but the observations of the party were confined to the valley of the Mancos. Mounds in different localities show that the banks of the streams once held numerous villages. Foundations of great square blocks, of single buildings and of circular enclosures, can be made out; the latter generally with a depressed surface, showing an excavation for some purpose. The greater portion of these mounds are now overgrown with artemisia, pinyon pine and cedar, concealing them almost from casual observation. The surest indication is the quantity of pottery, curiously ornamented, painted and glazed, all broken into very small pieces.

Some of the buildings are found in a remarkable state of preservation, considering the time since they were built and occupied. The engravings on this page represent a few of them, and other illustrations which we will give hereafter show even better preserved and more curious specimens.

Figure 1 shows a portion of an old tower, which was found in the midst of a group of more dimly marked ruins or foundations, extending some distance in each direction from it. As seen in the figure referred to, the tower consists of two lines of walls, the space between them divided into apartments with a single circular room in the center. The outside diameter of all is 25 feet, and the walls 18 and 20 inches thick. The stones of which the tower was constructed are irregular in size and shape, but with the outer face dressed to a uniform surface.

Figures 2 and 3 show another view. The tower is circular as shown, is 12 feet in diameter and now almost 20 feet high, with 16-inch walls. Facing the valley to the north is a window-like aperture. By referring to Figure 3 it will be seen that a rectangular structure, divided into two apartments, each about 15 feet square, joins the tower. Only one corner of three or four courses of masonry remains, shown in the sketch by shaded lines; the rest being indicated by loose debris. These squares were probably underground apartments, their roofs not reaching to the window.

Fig. 4 shows the corner and portion of the doorway of a house, showing considerable care and skill in its construction. Fig. 5 is one of the little nest-like habitations built in the vertical face of the rock. Communication with the outside world is from a small window-like door not shown in the sketch. Two small apertures furnish a lookout over the valley. The walls are as firm and solid as the rocks upon which they are built. The stones are small but regular in size. This is not a commodious dwelling; 15 feet would span its length and six its height, while in depth it is not more than five feet. Near by, upon a low ledge, and readily accessible from below, is a string of five or six houses, evidently communicating. Scratched into the face of the cliff which contains these houses are various inscriptions, one of which is depicted in Fig. 6. As they are not cut in very deeply, and in some places mere scratches, it is very doubtful whether they are contemporaneous with the houses themselves.

INCREASE OF PATENTS.—For some time previous to January 1st, the number of weekly issues of United States patents for inventions was unusually low. From that date there has been a rapid increase, as the following figures, obtained by us during a recent visit to the Patent Office, show: There were issued January 2d, 199; 9th, 227; 16th, 264; 23d, 297; 30th, 302; February 6th, 352. We observed, in our brief visit, substantial improvements made in the workings of the Patent Office during the past few days.

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective superintendents on file at the offices in this city. Considerable of this news is later than that procured from the interior journals:

Telegram of the 20th from the Con. Virginia states that they made connection with the deep winze from the 1650-foot level on that morning,

the joint winze on Savage north line, thereby causing a good circulation of air.

The various ore stopes on the several levels of the California are yielding the desired quantity and quality of ore.

In the Justice the ore-producing stopes throughout the 400, 500, 600, 700, and 800-foot levels present their usual fine appearance and are yielding their uniform quality of milling ore. No. 2 cross-cut, 600-foot level, continues to look most promising indeed, and producing a good average quality of milling ore.

In the Caledonia the surface pump bob broke

ANCIENT RUINS IN SOUTHWESTERN COLORADO.

so that an improvement in the air has been experienced.

The Rough and Ready mill started up on the 24th ult.

The Eureka Con. mine still shows improvement in the character and extent of ore bodies. The 10th level drift is being run west near the hanging wall. The ore body is looking well and improving in quality and quantity. Have started raise in ore body and will continue same until making connection with 9th level; 9th level ore body is looking first-rate; are taking out 100 tons per day of first-class ore.

The object of the south drift, 1750-foot level, of the Gould & Curry mine, is to connect with

last week and the water raised 160 feet.

The ore in the Overman winze continues to assay high in gold.

The only work being performed in the Meadow Valley mine is that done by chloriders in the old abandoned levels and they have been worked over so often that what little ore remains to be extracted is of rather low grade.

The Hussey has commenced milling its ore. The Grand Prize mill started up on the 23d and is doing good work.

They have struck the north ledge in the main tunnel of the Vanderbilt, the ore looks well.

The prospects of developing an ore body in the Coso Con. are said to be very flattering.

Relocating Claims.

In our issue of the 17th ult. we published an article on the subject of annual expenditures on mining claims, explaining the conditions under which the claims would be forfeited and also those under which they could be taken up. Several cases have occurred lately where claims have been relocated by other parties because the original owners had forfeited their title by non-compliance with the United States laws in regard to the annual expenditure required. The relocators will be protected by the Courts in the ownership of property acquired in this manner, without doubt; so that it behooves all those who have claims which they intend to keep to either work them and spend the amount required or patent them. Failing to do this, the claims are subject to relocation by the first man who comes along after the claim is forfeited. It must be remembered, moreover, that the Commissioner of the Land Office has decided that the year shall commence from the date of location of the claim.

Another question of importance in this connection is with regard to the ownership of improvements in the mines thus abandoned. Of course a mill or any movable property does not come under the law and belongs to the original owner; but the shafts, tunnels, drifts, etc., which are part of the mine, become the property of the relocater, the same as the claim does. The Recorder of Tintic district, Utah, communicates the following to the Salt Lake Tribune, which explains itself, and gives an official opinion on this question:

"Having had much discussion upon the subject of working in abandoned tunnels and shafts, by relocators, and understanding that some of the best attorneys of Salt Lake held that a person, or persons, relocating a forfeited claim, could not take advantage of the work done by the former owners, but must sink new shafts or new tunnels, I wrote to the Commissioner. His answer is as follows:

Department of the Interior, Gen'l Land Office, }
WASHINGTON, D. C., Feb. 1st, 1877.
A. G. Sutherland, Esq., Silver City, Utah:
SIR:—Referring to your letter of the 17th ult., I have to state that where parties relocate abandoned tunnels or mines, they may continue the work already commenced or sink new shafts, at their option. Very respectfully,
J. A. WILLIAMSON, Commissioner."

The Sutro Tunnel.

First-rate work is being done in the Sutro tunnel and the progress is now very rapid. At the measurement on the 22d ult., it was found that 101 feet had been made during the week, the total length being 16,136 feet. About 91 inches of water is flowing from the tunnel. Two new passenger cars, to carry 12 men each, have been placed on the track. The flow of hot water continues. In an item on the work done in the tunnel the Independent says:

The first week of the present month the header of the Sutro tunnel was advanced 90 feet; the second week 80 feet; the third week, ending on the 22d instant, 101 feet. This looks as though the men who work in the header will receive a premium this month almost equally as large as last month, notwithstanding there being but 28 days to count on. This progress is unparalleled in the history of the Sutro tunnel. The number of men at present working in the header, directly and indirectly, is in the neighborhood of 60. The manner and rate the work is prosecuted speaks well for Foreman Bluet, the shift bosses, and the miners in particular. Ninety-four feet per week driven through the heart of the mountain, where, at times, the rock is almost of adamant hardness, by the number of men above mentioned, shows that in the Sutro tunnel are employed the hardest working miners on or in the neighborhood of the Comstock.

A GREAT many miners are leaving the Pennsylvania coal regions, on account of scarcity of work and low wages. We hear that many have emigrated to the Black Hills.

CORRESPONDENCE.

Mines, Sampling Mills and Smelting Works Around Salt Lake City.

[From our Traveling Correspondent.]

Utah abounds in the precious as well as in the baser metals. Her last year's gold product was \$75,000, copper, \$144,725, silver-lead ore nearly \$8,000,000, saying nothing of some 1,643 tons of iron ore, 20,000 tons of coal and a considerable quantity of coke, salt, sulphur, fire-brick, lime and similar products. As the mining and reduction of argentiferous galena ores occupy by far the largest share of attention in the vicinity of Salt Lake, it may be well to state at the outset that no lead ore, as such, can be shipped from Utah at present rate of freights. It must carry sufficient silver to pay for marketing the lead. The ore is sold as a general thing on the standard of from 30% to 35% lead. For example, if the ore carries 45% lead, 35% is deducted for which no pay is received, the remaining 10 units being paid for at the rate of 50 cents per unit, or \$5 for the lead contained in one ton of ore.

If it costs \$5 for mining and \$3.25 for freight to smelting works, the loss (\$3.25) must be paid from the silver contained in the lead. The cost of bituminous coal at the furnaces runs from \$10 to \$12 per ton, according to quality; charcoal, 19 cents per bushel; wood, \$16 per cord; and coke, costing only \$1.30 at Connellsville, Penn., cannot be laid down here for less than \$27.50 per ton; from which it will be seen that the great desideratum of Utah is cheap fuel and lower freights. But in spite of these disadvantages, sampling mills and reduction works, modeled after the very best patterns to be found in either continent, everywhere abound, in consequence of which a ready market is obtained by the miner at his own door, as it were, for every ton of ore sufficiently valuable to pay for its extraction and freight to the smelting works.

The Pioneer Sampling Works,

The property of Mr. R. McIntosh, of Salt Lake, are located at Sandy, on the line of the U. S. R. R., 12 miles from the city, and in direct communication by railway with the mines at Bingham Canyon, Alta and other productive districts. As they are perhaps the most extensive and best appointed in the Territory, a little description in detail may not be amiss: They are under the supervision of Mr. Fred. W. Day, whose fine business qualifications have contributed not a little to the success of the mill, which is said to be conducted after the same method as similar establishments at Swansea and Liverpool. The quality of the ore decides the quantity to be sampled; for instance, if it is very rich the whole is sampled; if it runs as much as \$100 per ton, one-fifth, and if worth only \$50 per ton, one-tenth is deemed sufficient. The ore first passes under a crusher, then is further lessened in size by means of a grinder, when it is thoroughly mixed and reduced in quantity sufficient for pulverization. After being perfectly dried, it is put through a 90-mesh sieve, when it is ready for bottling. The bottles are delivered to the owner of the ore, sealed and labeled with the name of the ore and the quantity sampled, which are now taken to custom assayers to determine the value of the ore. The usual mode of disposing of it, is by sealed bids from the smelters, the highest bidder securing the ore. In this way the poor miner or prospector, who finds good ore near the surface, is enabled to realize something immediately, and is not so dependent upon outside capital as those of many other mining districts.

Something of the Smelting Furnaces.

On the authority of the Salt Lake *Tribune*, to whose columns we are indebted for many valuable facts, many smelting companies have suspended operations here since the opening of the mines from ignorance or mismanagement, or more probably from both. But experience and skill have in a measure triumphed, and all the smelters in operation are represented as running at present with comparative success. In Salt Lake county there are 11 smelters, eight of which have been turning out, on an average, 70 tons of base bullion daily, of about \$14,000 value. With few exceptions they are managed by men educated in the theory and practice of reducing ores, and of sufficient financing ability to conduct the business on true economic principles, some of the most successful operators having acquired their skill from practical experience in manipulating the base and often rebellious ores of surrounding districts.

The Flagstaff Smelting Works,

Leased some time since by Messrs. Mathier and Geist, may be taken as a good illustration of what can be done in this department by careful management and through system, combined with an accurate knowledge of the character of the ores to be treated, together with the necessary skill for arriving at successful results in their treatment. The works are situated at Sandy station, on the line of the U. S. R. R., and have been put in thorough repair within the past few months. At an outlay of nearly \$40,000,

inclusive of improvements and all of the four stacks fixed up. Everything about the premises goes forward with the regularity of clock work. Each man knows his duty and performs it. Ninety men are employed about the works, and 120 tons of ore reduced every 24 hours, yielding three car-loads of base bullion daily. One of the most valuable of the recent improvements is an 80-horse-engine, the old one being still kept in place and condition in case of an accident to the other.

Fume condensers have been put in, the smoke from each furnace being forced through a series of chambers, where the dust, assaying about 35% lead and 24 ounces silver, is saved, and afterwards put through the furnaces with matte. A reverberatory furnace for roasting refractory ores has just been completed, and every preparation has been or is about to be made to grapple with any and every class of ores, however rebellious, that may be sent to the works.

The Galena Smelter,

The property of the Jordan M. & S. Co., is situated at West Jordan, on the Bingham Canyon railroad, and consists of seven stacks, three of which have been leased by Prof. Holden, of the Old Telegraph company, and recently rebuilt in good style and after the most improved patterns. The capacity of the four remaining stacks per 24 hours, inclusive of ores and flux, is about 25 tons each.

These works have a double vertical turbine wheel of 400-horse power, the water being supplied by a ditch nine miles in length. The last year's product amounted to 235 car-loads of base bullion, at an average value of \$1,600 per car-load. In connection with these works there is also a sampling mill, where some 300 tons of ore are sampled per month. Mr. A. Raht has charge of the furnaces, while the whole is under the charge of Capt. Selfridge, of Salt Lake.

The Sheridan Hill Smelter,

Immediately adjoining, turned out last year 193 car-loads of 10½ tons to the car, worth, according to Superintendent Rumfield's calculation, \$2,000 to the car-load, making a total of \$386,000.

The Germania Smelter,

On Little Cottonwood creek, six miles from the city, on the line of the U. S. R. R., is conducted with skill and energy, turning off some of the purest lead bullion produced in Utah. The machinery is of the best manufacture and does its work constantly and without stoppages. The engine is a very fine one of 40-horse power, with ample capacity to keep the blasts of both furnaces, while the pump, one of the neatest to be found, is capable of throwing 300 gallons of water per minute. Among the recent improvements, new refining works for separating the silver from the base bullion have been constructed. Leading rarely occurs, as the fume condensers catch the poisonous dust before it reaches the open air. Product of base bullion last year, 1,700 tons, with a total value of about \$262,500. A few cases have been selected as samples in this important and growing branch of industry.

Some of the Leading Mines

In the vicinity of Salt Lake will next receive attention. Within 50 miles of the city there are several mining camps, more or less flourishing, such as Parley's Park, Alta City, in the neighborhood of the two Cottonwoods, Bingham Canyon, Jacob City, perhaps better known as Dry Canyon, and others of considerable importance.

In the immediate vicinity of Parley's Park, 32 miles from the city, is situated one of the most noted and valuable mines of the Territory, the property of

The Ontario S. M. Co.,

A San Francisco incorporation and under the efficient management of Mr. R. C. Chambers, a gentleman of ability and widely known in mining circles on the coast. The strike of the vein is east and west, with dip to the north, and as it cuts the bedding of the country rock somewhat obliquely to the vertical axis of the earth, is pronounced by all versed in such matters a true fissure vein.

The general formation is pronounced a quartzite of the carboniferous age. A large feldspar, porphyry dyke cuts the country rock, parallel to the lode, distant from it about 30 feet. The width of ore vein varies from two to seven feet, with probably an average from two and a half to three feet. Over 15,000 tons of ore have been extracted from 1st and 2d levels, sample assay value \$84.60 per ton. The shaft has been sunk 200 feet deeper, making a total depth of 400 feet, and two other levels run (making in the aggregate about 4,500 feet). Opening up additional ground, estimated to contain about 30,000 tons, valued at \$2,238,000 in silver.

Preparations are now in progress to sink working shaft 200 feet deeper, so as to keep explorations two years ahead of the extraction of ore. A 40-stamp mill (dry crushing), complete in every department, capacity from 70 to 80 tons, has just been finished, 20 stamps employed in working the free ores, raw, the other 20 being engaged upon the base or rebellious ores of the mine, which are chloridized by means of a Stetefeldt furnace.

The mine has already added to the bullion product of the coast nearly \$1,000,000 within the past 15 months, the ore being worked in a mill leased by the company. This amount will doubtless be doubled the ensuing year, as the capacity of the new mill is more than twice as great as that heretofore used on the ores. The mine has thus far paid all expenses for develop-

ments and improvements, and is now in a condition to pay regular and handsome monthly dividends to its owners.

The Walker & Webster—a bed vein—the Hawkeye and a number of other locations, are looked upon as promising.

West Mountain Mining District.

The mines are situated along Bingham canyon from 25 to 30 miles from Salt Lake, and reached by railroad. They extend eight miles from southeast to northwest, and have a width of about six miles, divided into four great mineral belts for convenience of classification.

The junction of the quartzite and limestone occurs on the northwest side of the district. The general formation in this belt is quartzite and the character of ore gray carbonates of lead, frequently of high grade. A great amount of work has been done, with fine prospects for dividend-paying mines at no distant period.

The next belt southeast, lying mainly in quartzite and bordering on the granite, carries ore predominating in heavy sulphates of lead and running from 30 to 100 ounces in silver.

The third belt has a granite formation, veins often large and showing permanence. Many of the most promising and valuable mines are found in this belt.

The fourth belt, crossing Black Jack gulch and Butterfield canyon, borders on one side on the lime; veins usually small, but frequently very rich in silver ore and light in lead, generally free milling.

About 200 tons of ore are shipped daily from the district, and if the present price of lead ore is sustained, the amount will probably be more than doubled the ensuing season.

The Winnamuck and Dixon.

The property of an English company, are situated near the depot of the Bingham Canyon railroad. Greatest depth from surface nearly 1,000 feet. Four tunnels, the largest 1,400 feet. Vein of ore from 18 inches to six feet. Ores of great variety, carbonates, free milling and refractory, high grade in silver (50 to 300 ounces) and low in lead (10% to 30%). The product of the mines, mostly from the Dixon, in the last 18 months has been about \$200,000, the principal work being expended in making further developments on the Winnamuck, which is now yielding 600 tons of ore per month, with average gross value of \$45 per ton, or something upwards of \$25,000. During the three years previous it is said to have yielded as much as \$1,250,000.

The Dial

(Judge Kinny), in same vicinity. Incline 200 feet and cross-cut of 30 feet. A level at the depth of 100 feet shows a vein of a few inches in width with pockets of chloride ore (from two and a half to three feet), running from \$185 to \$400 in silver. At a depth of 130 feet some very rich chloride ore has been encountered, yielding \$1,000 per ton, lying mostly on or near the foot-wall. At the 200-foot level and 40 feet from foot-wall a four-inch vein was found worth \$200 per ton; walls, quartzite and black lime.

The Old Telegraph

Owens 10 claims, of a mile in length, which are worked by tunnels; the greatest vertical depth, 500 feet. The ore is found in bedded veins (walls quartzite) and principally in chimneys, and consists of carbonates and sulphurets of lead, running from 16 to 22 ounces in silver and from 30% to 40% lead. The mine is turning out at present not less than 1,500 tons per month, which is conveyed directly from the mine to the different furnaces for smelting, by the Bingham Canyon railroad. The whole is under the general control of Prof. Holden. The underground works are well timbered throughout with square sets, sawed at the company's mill, built on the ground for the purpose, and although the ore is far from being high grade, yet owing to its quantity and good economical management on the part of the officers, it has proved to be a very productive mine, and is looked upon as one of the best paying institutions in the Territory.

The Yosemite

(Johns, May & Merrill), has been steadily and profitably worked for the past three years. Greatest depth by incline, 400 feet, with four levels east and west from same. It lies in the quartzite and has an average width of 30 inches. Character of ore, carbonates with bunches of galena and crystallized lead, going about 65%, 16 ounces on the average in silver, and improving in character as depth is attained. The mine is systematically opened and worked. Very fine hoisting works have recently been erected, and everything seemed to be going forward swimmingly under the management of Mr. W. M. Nesbit, the foreman in charge at the time.

The Reverse Mine,

Owned by Messrs. Winsor, Randall, and Longstreet; incline shaft 680 feet, nearly 4,000 feet of levels, a bedded vein from five to 40 feet in width, foot-wall, lime; hanging quartzite. Monthly shipments of ore run from 300 to 600 tons of gray carbonate, carrying from 48% to 65% lead, and from 15 to 38 ounces silver. It is represented as having paid almost from the grass roots down; having produced within two years past \$129,000, during which time improvements have been made to the amount of over \$50,000.

The Jordan Mine,

Opened by tunnel 800 feet, striking lode at 200 feet from surface, showing at that depth a width from wall to wall of from 10 to 15 feet.

Ore, plumbiferous, 47% lead, and from 12 to 14 ounces silver. Number of men at present, 16, and for the past five months is understood to have been on a paying basis. Mr. Edward Couch, Superintendent at mine; Capt. Selfridge, of Salt Lake, General Manager.

The Glasgow

Mining company, Mr. G. A. Jackson Superintendent, has a tunnel on the Vulcan of 140 feet, running 60 feet on the vein, with width of ore of eight feet, four of which is first-class gray carbonate and galena; thought to average 35 ounces in silver, and 60% lead; foot-wall limestone; hanging syenite. About 1,600 sacks taken out the past three weeks. The same company have also a tunnel on the Gem 480 feet in length, with 100 feet more to run to reach a depth from surface of 350 feet. Lode four feet in granite, with one foot of ore—going 40 ounces silver and 50% lead.

The Miller, belonging to same, is three feet between granite walls and has one and a half feet of ore averaging about the same as last.

Owing to the length of this latter, detailed descriptions of many valuable or promising mines are necessarily omitted, such as the Last Chance, which has paid its dividends, the Neptune, the Ashland, the Spanish, Scorpion, Mountain Maid, Burning Moscow, Miners' Home, and many others. Sufficient, however, has been given to indicate its importance as a field for mining operations and the judicious employment of capital. A. C. K.

The Discoverer of the Chollar Mine.

EDITORS PRESS:—In your issue of December 30th, 1876, your article, "Comstock Papers," states that Mr. William Chollar "some seven or eight years ago, at the earnest solicitation of his brother, living in Connecticut, went home to that State, where he is reported to have since died."

It may interest some of his former friends and mining associates on the Pacific slope to know something of the present whereabouts of this famous prospector and miner. Mr. William Chollar returned from Nevada to Danielsonville, Conn., in the fall of 1873, and has made his home a part of the time with his son, William H. Chollar. During the past two years he has been engaged in prospecting in the towns of Eastford and Woodstock, in this State. He has located a mine of fair prospects in each of these two towns. The assays from both locations are considered flattering by himself and his associates. This winter he is with his partner, Mr. Brown, in Woodstock, engaged in sinking a shaft, and he is prosecuting his mining enterprise with his usual energy and enthusiasm. His postoffice address is Woodstock, Conn. He is confident that there is great mineral wealth in New England, and that all that is wanted to successfully develop it is enterprise and practical mining experience.

He is the same genial and confident person as of yore, when he discovered the famous Chollar mine, and certainly he has the best wishes of everybody for his success in his present mining enterprise. JOSHUA PERKINS.

Danielsonville, Conn., Feb. 12th, 1877.

Oregon Mines.

The *Mountaineer* has the following to say about the Grant county bonanza (Oregon): Mr. Chas. S. Miller has been four or five weeks in the mines of Granite Creek district, in Grant county, at work testing the rock taken from the different ledges partly developed in the Granite district, and he informs us that these are the richest mines he ever saw. Mr. Miller is a practical metallurgist, and an honorable, upright gentleman, and has probably had as much experience in such matters as any other man on the Pacific coast.

The principal mine in the district and the one that has the greatest amount of work done on it and is therefore the most developed, is the Monumental, which was discovered by Mr. Harry McCann in the year 1865. This mine contains a double shaft—four feet each in the clear—108 feet deep. At a depth of 50 feet a level running north 60 feet, connecting with an air shaft, and one running south 45 feet. At 108 feet, a level running north 40 feet and south 35 feet. The miners are now engaged in running a tunnel to strike the vein 300 feet below the surface. This mine contains 3,000 feet on the ledge, running 1,500 feet each way from the main shaft. The mine is now well prospected and all that is needed is machinery to work it. It is supposed that there is over \$1,000,000 of the precious metals—gold and silver—in sight, and a large portion of it already mined and ready for the reduction works.

Mr. M. showed us a small brick of silver, weighing over an ounce, that he extracted from one pound of rock, and also a piece of gold worth about one dollar, that he took from one ounce of rock. Mr. Miller tested the rock from the top down, having made some 70 assays. He has brought the rock with him from which he made the assays and has them all nicely labeled so that the same may be tested by some other scientist to corroborate the assays of Mr. Miller.

Mr. M. intended leaving for Portland this morning with his specimens, to lay the matter before some of the enterprising moneyed men of that city to see what he can do towards raising funds to work this mine.

MECHANICAL PROGRESS.

Looking for Defects in Boilers.

In reference to Cornish boilers more particularly, says the *Manufacturer and Builder*, first look at the bottoms to see that they are not damaged by being moved on common rollers. If such has occurred there will be hollows or flat places in the plates. Examine the man-holes; see that they have not been damaged by having "toggles" put across them for the purpose of moving or lifting the boiler. See that blocks or pieces of wood have not been left inside, between, or under the furnace or tubes. Examine all round the bottom flange of the steam-chest to see that it has not been cracked in the riveting; and examine the same inside the boiler to see that it has not been filled up with iron borings, which is commonly done by bad workmen to conceal a crack in the bottom flange of steam-chests, and will frequently enable them to pass unobserved under the water test, but generally gives way to some extent when steam is got up. Examine the angle-iron rings round the ends of the tubes, between the rivet heads, especially under the bottoms of the tubes, and see that there are not any cracks running from rivet to rivet. Next examine the gusset-stays at the ends of the boiler, and see that the rivets are not loose, also that they are not all of one size. It often happens that these stays are put in by boys or incompetent workmen; that the holes are unfair, that the riveters cannot put the proper sized rivets in the holes and therefore put in anything that will go in, thinking, as they are out of sight, that they are of no consequence. See that the water indicators are properly fixed, and that bits of red lead are not stuck in the holes. See that the bearing-bars are the proper length, and not likely to drop out when the boiler is at work. Further see that there is room for the fire-bars to expand when they become heated; and finally see that the blow-off cock does not leak, and that the safety-valve lever will lift up and down quite easily.

In looking for defects in marine boilers, examine very carefully all the plates exposed to the action of the fire. Next, look at the ends of the screwed stays; see that they are not put through a seam of rivets by mistake; sometimes a stay is screwed in a rivet hole but that does no harm. Examine the ends of the tubes and see if pieces of hoop-iron have been put round anywhere the holes have been bored too large, also see that the tubes are not too short—they should all project some distance through the tube plate (about one-quarter of an inch).

See that no pieces of wood or anything else has been left inside the boiler, and that the fire-boxes are not jammed against the shell at the back or under the bottom, or where the side of the shell begins to take a curved form. Examine all the internal stays, see that they are not bent to clear anything, also that they are not fractured where they have been welded, and that the rivet heads in them are all one size, and not loose, or if they are really riveted. Also see that all the pins are in the holes, and the keys in the pins, particularly in the bottom, and notice that the stays between the tubes are "fair between," and not straining on any of them; and that the stays appear to be all equally tight. If they are all slightly flexible when pulled with the hand, they will answer; but if some are quite rigid and others rather loose, they are not at all safe.

SALES OF WAR MATERIAL.—We read that both Russia and Turkey have for some time past been sending large orders for small arms and cartridges to the United States. A supply of Colt's rifle machinery has been sent to Russia, and is turning out large numbers of rifles for the Russian army. The number already manufactured in Russia by machinery purchased by General Gorloff from Colt's Rifle Company is estimated at 3,000,000. Russia has also during the past year imported from another American firm 100,000 pistols. There has likewise been perfected in America what is now called the Russian cartridge, 20,000,000 of which have been made in Bridgeport, Conn. Cartridge machinery has also been sent from America to Russia, and 400,000 cartridges are being manufactured daily at St. Petersburg and Moscow. The Turkish government has entered into a contract with the Rhode Island Company for the supply of 800,000 Martini-Henry rifles, of which 250,000 have already been shipped; 100,000 more are ready for export, and materials for another 100,000 are on hand at the works.

JOHN ADAMS BLAKE.—The *N. Y. Mining Journal* notes with a regret shared in by all who knew him, the death of Mr. John Adams Blake, for many years the active member of the Blake Crusher Company of New Haven. Mr. Blake's death occurred suddenly on the 3d inst, in his 68th year. As an inventor of one of the most important improvements in mining machinery that has appeared in this fruitful age, Mr. Blake's name has become quite familiar to the readers of this journal, and those who had the pleasure of his acquaintance will deeply regret to hear of the death of one who was held in high esteem for his private virtues as well as his public record. In the management of the firm of Blake Brothers, Mr. Blake is worthily succeeded by his son, who is a gentleman of high literary and scientific attainments.

Patents and Population.

The report of the United States Commissioner of Patents is at hand. It is interesting to note, says the *Iron Age*, that the number of patents granted in 1876 was greater than in any previous year, being 17,026, but it is also to be remarked that the number of applications for patents was not as large as in either of the two years immediately preceding, and only 1,000 larger than in 1873. The table showing the number of patents issued to residents of the different States and Territories is a very significant one, as it also shows the proportion of patents to the population. Most of the Southern States are but poorly represented. Alabama takes out but one patent for every 21,600 population, in round numbers; Arkansas takes out one patent for every 21,000 inhabitants; South Carolina one for 22,700; California one for 1,376; while Massachusetts takes out one in 918, Rhode Island one in 941 and Connecticut one in 730. The District of Columbia shows even better figures, namely, one to 668. Inventors will make their own comments upon the latter fact, and judging from those we have heard they will not be at all complimentary. The Territories are evidently too busy in developing their own resources to deal much with patents, although Wyoming has a pretty fair record, having taken out 10 patents during the year, or one to every 1,151 inhabitants. On the other hand, New Mexico took out but one for her 111,303 inhabitants. The number of patents taken out seems to be a very accurate index of the industrial activity of a State or Territory. Thus the South, with its limited industries, takes out but few patents, while the Northern States, with their very active industries, take out a very large number in proportion to their population.

American Enterprise.

A correspondent to the *Manchester Examiner* says: The Americans sell machinery better than we in England do. If they make a good tool or implement they introduce it with great ability to the man who wants or is likely to want it. A few years ago it was considered *infra dig* for a large engineering firm to advertise or publish circulars, and it has been said of a late firm that orders were only received on Wednesday from 11 to 1. When the Americans have a good thing to sell they let everybody know it; they have their machine merchants, and devote far more attention than we do to the discovery of a customer. The books of their mechanical tool makers are wonderful productions, and their catalogue literature I have not seen at all equaled by the tool makers of this country. Allow me to give one illustration of the advantages the Americans derive from their system of advertising. I know a man near Oldham who will make a small hand drilling machine for £5, and who sells a few occasionally! The same thing, only very much lighter, is made in the United States; it comes here heralded by an illustrated circular, a man is appointed who earns a living by selling such things, and in consequence of superior commercial enterprise the American one sells at £6 10s. The American tools which are being sold in this country are dear. Some of them are very good and many are worthless scrap, but all dear, and yet they sell well. It has filled me with astonishment to see lathes, drilling machines, chucks, slide rests and other goods command high prices, simply because the Americans take the trouble to let people know what they have to sell, nicely illustrate it and carefully give dimensions and prices. If you want to buy similar goods from English tool makers I can name, it takes as much trouble to get at prices and particulars as it does to extract an ancient tooth.

THE STEAM ENGINE OF THE FUTURE.—A lecture was delivered, says the *London Mining Journal*, in Greenock, in celebration of the anniversary of James Watt and the centenary of the completion of the first practical steam engine. Mr. J. Scott Russell was the lecturer, and the theme of his lecture took the form of queries as to whether we had discharged our duty as trustees of that valuable gift to mankind, whether we have during one century got out of the steam engine all the good to humanity which it was capable of producing, and finally, what was the work which James Watt had left us to do in the coming century? Mr. Russell, in answering these questions, was of the opinion that, as trustees of the steam engine, we had worthily discharged our duty; and that the duty left by Watt was, in point of fact, the invention of a new steam engine which would occupy less space, consume less fuel, and perform the work of the world at one-half the cost, and render all the elements of modern life cheap and abundant, instead of dear and scarce. But is such an engine possible? It is not impossible; and Mr. Russell's contribution to the solution of the subject gives hope that "the steam engine of the future" may become a great fact before the end of the present century.

THE LARGEST CLOCK.—The clock in the Crystal Palace at Sydenham, England, is said to be the largest in the world. The dial is 40 feet in diameter. The hands, with their counterpoises, weigh nearly a quarter of a ton. The minute hand measures 19 feet in length and moves half an inch at every beat of the pendulum. The distance traveled by the point of the minute hand is nearly four miles a week,

SCIENTIFIC PROGRESS.

A New Insect.

Mr. Fairfield presents in the *Phrenological Journal* a cut of a hitherto unknown insect, found in the brain and abdominal tissues of the common house-fly. He has in his possession, mounted for observation, six specimens out of more than 30 observed during a single dissection, besides a large number of ova and of embryos in different stages of development.

This little animal—the most minute of all the insects thus far discovered—is, in the mature state, about 1-500th of an inch in length, exclusive of the legs, by about 1-800th of an inch in breadth. That is to say, it is somewhat smaller than the larger animalcules found in stagnant water; but has four pairs of fully-developed, four jointed, insect legs; a pair of three-jointed antennae (feelers) terminating in minute hairs, and the usual permanent insect organs. It feeds by means of a couple of sucking disks, which appear to communicate with each other through a minute canal, each disk having, however, a special tube that leads backward to the minute digestive sac. This sac is scarcely larger than an ordinary white blood-corpuscle. The dorsal surface (back) resembles that of the *Argas Americana*, as figured by Professor Packard, and is an elongated convex surface of irregularly disposed cells, without definition into cephalic and thoracic sections. In its embryology the insect passes through a monad stage.

The egg first becomes granular and nucleated; then it puts forth a minute process. Presently it becomes double-nucleated, elongates and shows a disposition to propagate by self-division, exactly after the manner of a monad; but, at a certain stage, this tendency to division ceases, and the anterior cell becomes a center of development for the anterior organs of the animal, while the posterior becomes a hollow cavity, and gives origin to the first pair of legs. The tail, contemporaneous with these changes, thickens and shows a longitudinal striation, as if dividing into four tails, which, however, subsequently assume the consistency of two pairs of four-jointed insect legs. The anterior pair of the legs and the antennae are developed by budding. The animal has no eyes, but is copiously provided with minute hairs, after the usual manner of the insect type. I will not discuss that question in a mere note; but I believe that the entomologist has been the proper progenitor of that numerous family known as acaridae, of which the sugar mites are familiar representatives, and that the long-sought connecting link between monads and insects is at last discovered. The feet, not exhibited in the cut, consist of three claw-like processes, connected (I think, but am not yet certain) by their films of transparent tissue.

Lightning in Telegraph Offices.

At the late meeting of an English society of telegraph engineers, as reported by *Engineering*, it was shown by Mr. Preece that progress is being made towards arresting the damage sustained generally throughout the country, no less by the postal than by the various railway telegraph systems from the effect of lightning. It is at first sight a curious incident that in England, with the advantage of many years' experience, and with the application yearly of improved means for preventing it, telegraph apparatus should suffer to so much greater an extent than in other countries—even those in India—where electrical storms are so much more serious in their character and disastrous in their effects; but the reason is, as Mr. Preece remarked, to be found in the fact that telegraph wires and telegraph apparatus are with us as cobweb spun around and above the entire land. The consequence is that the most puny thunderstorm cannot approach our shores without embracing in its influence many miles of wire and many telegraph instruments, and when we realize the fact that this network of wire embraces some 170,000 miles of wire and some 20,000 instruments, the damage experienced, in comparison with other countries over which the wires and instruments are few and far between, will not appear so startling. It would appear that the experience of the postal telegraph system is to the effect that in 1872 some 1,200 faults, and from November 1st, 1875, to November 30th, 1875, some 442 faults arose from lightning. This is a very satisfactory diminution, and although it is possibly in measure due, as was pointed out, to the diminution in the intensity and frequency of the storms which passed over the country during each year, yet it shows plainly enough that its ravages are being grappled with, and we may fairly hope will in a reasonable time be brought within practicable bounds.

At the same meeting a model of a very simple protector was shown. It consisted of a plain metal base, which when fixed would be attached to the earth, a metal plate similar in size and shape to the base plate, but pierced with holes reduced towards their base so as to receive a number of loose points, which when the upper plate is lifted off will drop into these socket holes, and yet, when the plate is allowed to rest upon the earth, will in making contact with the lower plate be retained in their position, and make a sufficiently good contact with the plate itself to insure the passage of electricity of such a high potential as that obtained from atmospheric causes. Between the two plates is placed

a thick film of carbon, or a piece of thin paper, upon which the points referred to above are allowed to rest, not with sufficient force to make holes in it, yet so as to afford the arrangement all the advantages known to be derived from points as a means of discharge for electricity of high tension.

Conditions of Successful Scientific Work.

One hears a good deal talked now-a-days of scientific research, and among it a good deal of what I cannot but think mischievous nonsense about the peculiar powers required by scientific investigators. To listen to many, one would suppose that the faculty of adding anything whatever to natural knowledge was one possessed by extremely few persons. I believe, on the contrary, that any man possessed of average perseverance is capable, if he will, of doing good original scientific work. Any hardworking and commonly intelligent man, who likes his profession, will make a good soldier, or lawyer, or doctor, though that combination of powers which makes the general, or the great jurist, or the great physician, is given to but few.

So it is with the pursuit of science; assuredly not every one of her followers, very probably not one among us now present, will become a Linnaeus, or a Cuvier, or an Agassiz. It may not be given to any of us to make some brilliant discovery, or to first expound some illuminating generalization; but we can, each and all, if we will, do good and valuable work in elucidating the details of various branches of knowledge. All that is needed for such work, besides some leisure, intelligence, and common sense (and the more of each the better), is undaunted perseverance and absolute truthfulness; a perseverance unabated by failure, and a truthfulness incapable of the least perversion (either by way of omission or commission) in the description of an observation or of an experiment, or of the least reluctance to acknowledge an error once it is found to have been made. Moreover, this love of truth must extend to a constant searching and inquiry of the mind, with the perpetual endeavor to keep inferences from observation or experiment unbiased, so far as may be, by natural predilections or favorite theories. Perfect success in such an endeavor is, perhaps, unattainable, but the scientific worker must ever strive after it; theories are necessary to guide and systematize his work, and to lead its prosecution in new directions, but they must be servants, and not masters. I may, perhaps, seem to be insisting at too great length on a self-evident point; but the more one knows of scientific work and workers, the more does one realize the importance and the difficulty of attaining a perfectly balanced mind and of arriving at an unprejudiced deduction from observation.—*Professor Martin, in Popular Science Monthly.*

MOVEMENT IN TRILOBITES.—A second contribution to the subject of the nature of the legs of trilobites is published by Mr. C. D. Walcott, in the 28th report of the New York State Museum. From the evidence thus far obtained, he concludes that trilobites swam on their backs, and that they had a double row of appendages on each side of the central axis. "The central or axial series were either the attachments of swimming lobes or rudimentary, ambulatory legs. The lateral series were branched in their structure, the bars serving as points of attachment for their lamellae. It is probable that they were also used in swimming. Many sections show appendages beneath the head; but nothing satisfactory can be established from them. * * * A section of a partially coiled specimen shows fine branchial appendages on each side, brought into this position by the rolling up of the animal. These sections show that the axial are but one-third the length of the branchial appendages. The perfect state of preservation of the delicate branchial appendages and the ventral membrane precludes the idea of the destruction of anything of a stronger texture than fleshy swimming lobes attached to the axial appendages. The axial appendages could not have reached to the surface upon which the edges of the pleura rested, which negatives the view of their being in any way ambulatory, in case the non-presence of articulations in the appendages should be called in question."

"SIDEREAL PHOTOGRAPHY."—Mr. Huggins, F. R. S., says *London Iron*, made a very important communication to the Physical Society at its meeting on Saturday. For a long time he has been engaged with attempts to photograph the spectra of stars, and has obtained several partial successes. The chief difficulty to be overcome has been to follow the motion of the star with the telescope with sufficient accuracy, as a long exposure is requisite. This difficulty has been at last overcome, and there was shown on Saturday a clear photograph of the star *α Lyrae*. There is another interest attaching to this besides the fact that it is the first good photograph of the kind obtained. One of the calcium lines is wanting. Mr. Lookyer, some time ago, when experimenting on the dissociation of calcium, suggested that there were indications that the metal calcium as it exists on our planet is not an element. He pointed out that what was wanted was an examination of the calcium lines in the spectra of different stars, and for this their photographs were needed. Here was produced one such photograph as was wanted. Others will, no doubt, soon follow as atmospheric conditions permit. This first clearly strengthens the belief that calcium is not an element.

advance by spreading a want of confidence and throwing their stock upon the market. The *Enterprise* says further: "There is no earthly cause for the ruling low prices of stocks. They are not warranted in view of any condition of the mines. The opinion is general among those best posted in the present developments of the lower levels, and the prospects which attend them, that dividend-paying ledges will be uncovered before long both north and south independent of the big bonanza. The speculating portion of the community are, however, of an excitable order and ignorant, many of them, of the vast amount of work necessary to open up an ore-body after it has been discovered. The Comstock to-day promises as well as it did before the big bonanza was opened up, and some fine morning the world will again be astonished at the developments made and the public will be assured anew that there are millions upon millions still in the mountains surrounding us. If those who have stocks will but hold them and wait a little, till the mines have a chance to show their worth, they will have no cause to regret their course."

Belcher has at last levied an assessment of one dollar per share, aggregating \$104,000, delinquent March 29th. This is the first appeal of the kind to stockholders in nearly six years, and there is general regret that a mine which has since paid such liberal dividends should be placed back on the assessment list, though the Crown Point took the same course some time ago.

An adjourned meeting of the dissatisfied Lady Bryan stockholders was held on Monday evening. Dr. H. S. Stone presided, and J. Mcintosh acted as Secretary. A statement of the amount already expended was read, aggregating \$1,077.65, and the balance on hand was \$118.35. This amount was collected from the ten cent assessment levied upon the particular stock belonging to those who were dissatisfied with the old Directors of the company and which shares have succeeded in obtaining an injunction upon the collection of the last assessment. An appeal was made by Mr. Tarpey for more funds to con-

We are not able to chronicle any change in position of the stock market, everything remaining as for some time past, very dull. There is no animation whatever apparent. The *Enterprise* states as one of the causes of this continued dullness that very many who bought new stocks were at their lowest point saw fit to realize on the subsequent advance. There are many persons, both in San Francisco and Virginia, and in fact all over the coast, who wait for a big excitement before investing in stocks, and these are the ones who are the most frightened when a slight reaction comes and bid the bears in their attempts to break an

have succeeded in obtaining an injunction upon the collection of the last assessment. An appeal was made by Mr. Tarpey for more funds to continue the prosecution to a successful termination. Mr. Tarpey claimed that 87,500 shares had been sold at different assessments, and should be the property of the company. This, with the 21,000 shares in the hands of the company, gave an excess over the capital stock of 8,500 shares, which he said was most assuredly an over-issue to that amount. A motion was carried, extending the time for delinquents to pay their assessments ten days.

tinued the prosecution to a successful termination. Mr. Tarpey claimed that 87,500 shares had been sold at different assessments, and should be the property of the company. This, with the 21,000 shares in the hands of the company, gave an excess over the capital stock of 8,500 shares, which he said was most assuredly an over-issue to that amount. A motion was carried, extending the time for delinquents to pay their assessments ten days.

GENERAL DIAZ has been sworn in as President of the republic of Mexico,

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

THIS BACK.—Amador Ledger, Feb. 24: We visited this mine at Spanish gulch and were not a little surprised at the immense bodies of quartz cropping out all over the property. In one place the ledge is fully 80 feet wide. The former owners have put down several shafts a comparatively short distance, from all of which large quantities of gold have been obtained by simply pounding the rock by hand, and washing it in a rocker. They never attempted to work it on a scale commensurate with its magnitude. Six miners are now employed, who are running a cross-cut from the foot wall to the hanging wall. A pile of ore lay on the dump, all of which is full of rich lead galena sulphurets, a speck or so of free gold being occasionally visible. A reasonable estimate places the ore as good for at least \$10 or \$12 per ton. The ground is excellently situated for a mill, a fall of from 300 to 400 feet being easily obtainable. We believe it is the intention of the company to have a mill put up forthwith.

FORREST.—This is an old quartz claim located between the Liver mine and Plymouth. A shaft is down 170 feet, and from the hole upward of \$200,000 were taken. The rock paid handsomely from the surface down, which is considered by mining experts as a sure indication of a permanent mine. For many years this mine has been idle. Mr. Trelogan, formerly superintendent of the Governor, but now of the Tailman, is organizing a company to work the mine.

NEW QUARTZ DISCOVERY.—On Wednesday a Mexican named Caguelito brought to Jackson half a dozen pieces of surface rock which he says he broke from a ledge discovered by him about three miles from Jackson, in the direction of Volcano. One or two of the pieces showed specks of coarse gold. The discoverer says the ledge is four feet in width, and the gravel in the neighborhood quite rich. He thinks there is not a more valuable working within miles of this claim, and the information of the strike is a surprise to all.

SILVER TUNNEL.—This tunnel at Murphy's ridge is in 300 feet. Two small veins of quartz have been cut, one 10 inches and the other 20 inches in width. The rock is heavy and full of sulphurets, evidently containing a large percentage of iron. The workmen are pushing the tunnel head, to start the vein, which is supposed to be 50 or 60 feet further in the hill.

ACTIVITY AROUND NEW CHICAGO.—New Chicago, the latest candidate for admission into the list of towns in Amador county, moves along prosperously. It promises to be a very sprightly place this summer. Three or four quartz mills are running within a short distance of the town, and the work of prospecting for new leads goes on. **DIVERSITY.**—The California Mining company is maintaining its reputation for richness, pouring its dividends almost monthly into the pockets of the shareholders. There is yet plenty of rock in sight to justify the anticipation of regular dividends for months to come.

BUTTE.

THE MINER.—Oroville Mercury, Feb. 23: We had a call from L. A. Snow, of Little Kinshew, this week, who gave us many items in regard to the mines in the mountains. There is no winking the fact out of sight that the miners away up in the mountains, who depend on the snows of winter for their supply of water, will have a hard year of it. The miners of the mountains are not so much dependent on temporary help to them. Mr. Snow informs us that where the snow was from 15 to 18 feet in depth last year at this time, it is now only about a foot deep. A hot sun would soon carry it all off. Mr. Snow is working his claim on a small scale this winter, having only two pipes running and washing away but little dirt. When a good stream of living water is turned upon this ground through the improved sluice, the result is not to be doubted. The ground is rich and there is an abundance of it—enough to last for years.

HIO BAR MINING CLAIM.—We saw a letter from the President of the Big Bar company, saying that 150 feet of the flume had been laid, and that in ten days at most the rest of it would be completed and the water turned on. The grand trouble so far has been in waiting for a number of expensive articles that had not been ordered, and that only served to call for another assessment, much to the disgust of all of the stockholders. In a few days the water will be turned on and the mine thoroughly prospected.

MINING MACHINES.—Parties from all parts of the State are coming here every day to take a look at the novel mining machine that is now being run in the river. It works like a churn. The thing is so very simple that the only wonder is it was not discovered long ago. No one can tell how much gold is being taken out, as the boxes have not been cleaned up since the work began. One thing is certain, that it will work up everything clean from the bedrock.

CALAVERAS.

LAMPHEAR.—Calaveras Chronicle, Feb. 24: The work of freeing the Lamphear mine of water is completed, and as soon as the necessary timbers can be procured, active operations will be resumed. There is a good mill on the mine, levels run and stopes opened, and the rock averages well.

GRAVEL MINING OPERATIONS are unusually lively in this vicinity at present, miners being anxious to utilize the entire water supply while it lasts. All the hydraulic and tunnel claims are running full handed, and there is ready sale for every drop of water the ditch affords. It is the general impression that water will fail early this season, and miners are consequently putting in their "best legs" in anticipation of the approaching summer.

MOSER'S NEW HYDRAULIC.—Moser & Co., who for some time past have been engaged in opening a hydraulic claim on Tunnel ridge, nearly opposite Sport hill, have got everything in readiness and commenced piling. They found it necessary to run a bedrock tunnel 165 feet in length, through which to lay their flume. The shaft at the upper end of the tunnel, down which the gravel is washed into the flume, is 27 feet deep. The water for hydraulic has a pressure of 175 feet. The bank of gravel looks well, and we learn that the prospects of the mine are flattering.

RICK ROCK.—Mr. John Donnell informs us that rock of almost incredible richness is being taken from the Golden Hill quartz mine, located near Hill's ranch, on the San Andreas river. The mine has been worked for some time, and has yielded an average of \$36 per ton. All of the richest rock is taken out, however, and worked by another process. A stratum of the ledge, about six inches in thickness, is said to be absolutely cemented together with threads of gold.

WIN MINER.—Rapid progress is being made sinking the new shaft of this mine. It is expected to complete the sinking in about six weeks, when every thing will be in readiness for running the 1300-ft level. The batteries are kept in constant motion, an average of 100 tons of rock being crushed daily. The ore comes from the stopes of the 1200-ft level. A level has been run 300 feet north, at the depth of 1200 feet. The vein was found nearly the entire distance, but much broken up. The prospects are good for more gold, and the vein is richly mineralized.

UPPER COUNTRY JOTTINGS.—At West Point quartz mining is brisker than for some time previous. The main shaft in the Champion has reached a depth of 300 feet. The rock is now being stoped out. Work is progressing actively at the Field mine and good ore is being obtained. Everything is looking well at the Mina Rica. We hear it

rumored that a new shaft is to be sunk on the mine, but cannot vouch for the truth of the report. Messrs. Herbert & Marsh lately discovered a promising quartz lead near Sandy gulch, about half a mile from the West Point mine. The ledge prospects well. At Railroad Flat the Sunrise mine continues to yield good rock. Thirty tons of ore from the Chapman mine have been hauled to the mill. Griswold & Co., proprietors of the old Holmes mill, near Mesquite, have out a considerable quantity of good rock.

EL DORADO.

TAYLOR.—El Dorado Republican, Feb. 24: From the north side we learn that work on the 500-ft south level in the Taylor mine is progressing finely, with two to three feet of ore in the face. The work of opening the 500-ft level will soon be commenced, when things will be very lively at the Taylor. We learn that a clean-up was made at the Volcanville mine, on Saturday, which was highly gratifying to the owners.

RICH.—Mountain Democrat, Feb. 24: Kimball & Pugett are opening a rich quartz ledge on the face of the hill just west of the town of Gold Hill. Their ledge is large and well defined and gives fine prospects wherever it has been opened. On one recent occasion they took out \$500 in gold. The ledge is so rich that when fully opened they will have a very rich mine.

TRASKER.—The appearance of the amalgamators at the St. Lawrence indicates a yield from the run now in progress, which will far exceed the most sanguine expectations of the owners. It is quite certain that the entire crushing will average more than 865 per ton, and appearances indicate that it may nearly or quite double this figure. At this rate the grand total for the run will aggregate an amount so great as to be a tempting prize for highwaymen, and the owners do not consider it entirely safe to bring it over without a strong escort. Therefore a number of our citizens have consented to make the trip hence to the St. Lawrence, when notified of the clean-up, who will assist in escorting and guarding the treasure.

FRESNO.

COPPER.—Fresno Examiner, Feb. 24: The Ne Plus Ultra copper mining company started up their mine and their new machinery last week. The mine is under the superintendence of N. L. Bachman. It is now provided with steam-pumps and hoisting works and is for lifting the lower grades of ore. Work on the mine will soon be pushed forward vigorously and in a systematic manner, and it is now evident that it will yield a good return to its stockholders. By adopting the lixiviating process of working the lower grades of ore, thousands of tons of ore heretofore cast aside as worthless will be profitably worked.

INYO.

MINNETTA BELLE.—Coso Mining News, Feb. 24: Mr. James Mortenson, one of the Directors of the Minnetta Belle, came in from Lookout yesterday, and reports that everything connected with their operations are progressing rapidly. Mr. Jacobs is getting along finely with the mill.

COSO CON.—Chas. Purington, of the Coso Con. mining company, arrived here Sunday, and on Monday went out to look at the mine. Although he finds that a great deal of useless, but expensive, work has been done by the company, he thinks that it is not yet demonstrated that there is no ore body in the Bella Union. He has put to work a number of men, and is confident in finding ore soon; in fact, there is a fair pay-streak to commence upon at once.

DEFIANCE.—The third vein, now being worked on contract, is looking well and yielding considerable quantities of galena ore. The steam hoisting works were started last Saturday afternoon, and are working well, taking the rock from the 184-ft level. The furnace will be started about the 10th proximo, and Mr. Gorman expects to make an extended run.

LOS ANGELES.

COAL.—Los Angeles Herald, Feb. 24: The indications show growing that a coal ledge that a reliable coal vein has been struck in the Arroyo Seco. The discovery of coal in large quantities heretofore would simply revolutionize our city, and would make us a manufacturing center of considerable importance. Iron, copper and tin exist in large quantities within easy reach of Los Angeles. In addition, such a development would make us a smelting center for the ores of Arizona.

CRACKING.—Santa Monica Outlook, Feb. 24: Messrs. Heath, Eaton & Hancock are still "pegging away" hopefully at their coal mine in the vicinity of Santa Monica. One of the party informs us that the developments so far disclose thin veins of coal, bituminous slate, petroleum and gas. One of the workmen smelling the odor of gas, and suspecting its escapement from a small crevice, applied a torch, which he burned, thereby illuminating the way for some distance. The coal found is of an excellent quality, and is now only a question of quantity.

MONO.

MILLS AND MINES.—Cor. Inyo Independent, Feb. 17: The Comanche mine is next to perpetual motion, scarcely ever stopping, and every stage is laden with the precious metal. The Diana mill is making a very successful run, and shipped last week six bars of bullion, valued at \$7,000, the result of 13 days' work. The new shaft in the Diana mine is down nearly 400 feet, showing ore all the way down, and they have recently struck a large body of high grade ore with a better defined ledge than any ever seen in the Diana before.

NEVADA.

DEADWOOD MINER.—Grass Valley Union, Feb. 21: This mine is in Willow valley, above Nevada City. The valley is noted for numerous quartz ledges that have been but not worked in a miner-like style. The mine has been worked well even with poor working. The Deadwood has in times past paid \$95,000 in gold, and then work was stopped when good ore was close by the point of quitting. The mine was not kept open ahead, as is too often the case. A new company now has charge and the right kind of developments will be made. Only one crushing, as a trial, has been made, and the result was, and that yielded, by mill process, about \$21 to the ton.

BANNER.—Nevada Transcript, Feb. 21: The old Banner mine has been bonded to some parties in this city who have great confidence in the undeveloped wealth which lies in that ground. It is the general belief that it is a good mine if properly worked. The sale will probably take place in a very short time. The mine has been worked by the old Banner, and its neighbor, the North Banner, get well to going, when the Providence gets well down to business, when the New England, the Soggs, the Spanish, the Mountaineer, the Deadwood, the Gold Run and the Henhouse mines all get their levels well opened; when the Cold Spring, and the numerous claims on the old channel get under full headway, won't times be lively in this section? The work is being done in a very different way. Orosby & Mitchell have not yet decided where they will erect their sulphurets works. As soon as they get a place to suit them, their works will be in operation in about three weeks thereafter.

THE Oriental mill on Deer creek is kept in constant operation crushing quartz obtained from different ledges at Willow valley. **FOOTBALL TIDINGS.** Feb. 24: When this mine came under its present management it had been opened by shallow workings at several points and had one shaft down 100 feet. As very little was known in regard to the situation, it was thought best to pump out the deepest shaft and drift each way on the ledge to determine the number of ore shutters. The shafts were started up. When the old Banner, and its neighbor, the North Banner, get well to going, when the Providence gets well down to business, when the New England, the Soggs, the Spanish, the Mountaineer, the Deadwood, the Gold Run and the Henhouse mines all get their levels well opened; when the Cold Spring, and the numerous claims on the old channel get under full headway, won't times be lively in this section? The work is being done in a very different way. Orosby & Mitchell have not yet decided where they will erect their sulphurets works. As soon as they get a place to suit them, their works will be in operation in about three weeks thereafter.

THE Oriental mill on Deer creek is kept in constant operation crushing quartz obtained from different ledges at Willow valley. **FOOTBALL TIDINGS.** Feb. 24: When this mine came under its present management it had been opened by shallow workings at several points and had one shaft down 100 feet. As very little was known in regard to the situation, it was thought best to pump out the deepest shaft and drift each way on the ledge to determine the number of ore shutters. The shafts were started up. When the old Banner, and its neighbor, the North Banner, get well to going, when the Providence gets well down to business, when the New England, the Soggs, the Spanish, the Mountaineer, the Deadwood, the Gold Run and the Henhouse mines all get their levels well opened; when the Cold Spring, and the numerous claims on the old channel get under full headway, won't times be lively in this section? The work is being done in a very different way. Orosby & Mitchell have not yet decided where they will erect their sulphurets works. As soon as they get a place to suit them, their works will be in operation in about three weeks thereafter.

THE Soggs mine, over on Deer creek, it is thought, will soon be opened into a rich shaft again. The Soggs has long been a paying mine by spells. The owner seems to be full to comprehend the proper way to make it pay continuously—likes to pocket the profits instead of exploring ahead.

THE Alaska, down on the Colfax road, is turning out some very nice rock of late, showing free gold in liberal quantities. **ORLEANS.**—Nevada Transcript, Feb. 22: The Orleans is located on Gold Flat. It was worked some time ago as a lead mine, but it is now being worked as a silver mine, and has for some time laid idle. The owners are now opening out the drain tunnel and other necessary work preparatory to putting in heavier machinery at no distant day. The ledge is a large one and is heavily charged with sulphurets, and the rock taken from it when worked paid from \$14 to \$40 per ton. The revival of interest in quartz mining in this vicinity has stimulated the owners to go to work.

MINING SALE.—Ed. Carney and P. S. Goodspeed, of Hunt's hill, have sold their entire mining property to a corporation known as the Camden mining company. The sale was effected through John McAllis, Esq., of Smartsville, an experienced miner and a member of the Excelsior mining company. The property embraces nearly 100 acres of valuable mining ground, with fixtures, tools, and appliances, and immediate and practical work, and at \$25,000, the price said to have been paid, cannot but prove a profitable investment.

SOGGS.—The Superintendent of the Nevada mine, better known as the "Soggs," is about completing work that will open up a portion of the mine supposed to be very rich. At least on levels above the point being run for, in an early day, very rich rock was taken out. The Soggs is one of the oldest mines in the district, and if properly worked is one of the best. The great difficulty to be overcome in working it arises from the fact that the owner wants all the profits turned over as dividends and not used in necessary explorations. The dead work which has been going on for some time will soon enable the manager to prove that the outlay was judicious.

PLACER.

WASHINGTON.—Dutch Flat Forum, Feb. 24: The Elmore Hill, Polar Star, Southern Cross, Franklin, Star, Union and Summerset claims continue washing. The Baker Hill excluded 2,000 pounds of Judson powder on Thursday last, which is reported to have done the best execution of any blast in this section. The bank was composed of very hard cemented blue gravel. It was, however, favorably situated for blasting, being relieved in front and on one side. The effect was splendid. The entire mass was shaken and pulverized so that the boulders are almost entirely loosened from the cement, requiring but little labor to wash it off. It is now clear and the gravel is being removed with wonderful rapidity, the flames in the tunnel below being taxed to their full capacity with the passing gravel. The Central, Maryland Hill and Pacific claims continue washing.

AT Gold Run the Indiana Hill and Cedar claims, both of which are opening through 190 feet of gravel to a bedrock tunnel below, are making rapid progress.

SHADY RUN MINES.—The Wild Yankee company are making preparations to raise another shaft. The one now in use is in very deep ground, which is intermixed with pipe clay, and has kept up a continual sliding whenever they attempted to wash through it. The company also intend opening drift diggings immediately. The North American company are making good progress in breasting out. Mr. Davely, the superintendent, talks of prospecting the high ledge between Shady Run and Canyon creek, through tunnels, as croppings of a heavy wash are visible in places on both sides, thus showing splendid indication of the existence of an extensive channel.

LITTLE YORK.—The Empire and Christmas Hill companies are washing steadily with full heads of water. The Liberty Hill company have made a change in the working of their mine. The water in this mine is of very hard blue gravel, literally packed with boulders, and although rich, the delay in removing the same is so great that the further working of it will be postponed until water becomes scarce, as two hours' washing per day is sufficient to remove what gravel there is exposed by the continual removing of boulders. The upper stratum of gravel which they are now washing is easier worked, and the boulders which it contains are being removed in time, so that the washing is now progressing without interruption.

REMINOTON HILL.—As the weather at present is favorable for outside work, the Rhode Island company have resumed ground sluicing, which will be continued as long as the weather will permit, the working of the drift mines being also continued. The Wild West company are advancing their new tunnel, and although they have four feet of rim rock to contend with, the two feet of gravel found above it pays \$8 per day, including the time occupied in removing the bedrock.

SACRAMENTO.

TENNESSEE.—Folsom Telegraph, Feb. 23: The mining claim of Jarvis & Humphrey, of this place, situated on Richmond hill, is progressing finely, under Mr. Davis, the Superintendent. Workmen are running a tunnel in from each side of the hill and expect to meet each other in a short time, when drifting will begin in good earnest.

SIERRA.

ORO.—Mountain Messenger, Feb. 24: The rock being taken from the Oro mine appears to be of very good quality, and there is conclusive evidence that the hill contains a large body of pay ore. The mine has been lying idle for several years, but the tunnel appears to be in good condition.

LOCATIONS.—The following locations have been recorded recently: The North Fork company locates the waters of the North fork of Oregon creek. John Callagan, et al., have located the Moonshine gravel mine between the North and Middle forks of Indian creek, Plumas valley. A. Garibaldi, et al., have located five claims of 50 feet each on the M. M. Cristo, commencing 135 feet west of the Swallow company.

SONOMA.

COPPER DISCOVERY.—Russian River Flag, Feb. 22: The "Grizzly" copper mine was located in 1862 by a Healdsburg company. In that year G. P. Brumfield discovered the "Blue Buck," which he traded for the above mine. Mr. Brumfield has worked on it off and on ever since, at an expense of about \$5,000, mostly in money expended for labor, finding better and better deposits. One tunnel is now in 450 feet, another in about 30 feet, and work is progressing; a third has been commenced and is in 10 to 15 feet. Week before last a lode four feet wide of very rich yellow sulphurets of copper was discovered in the 90-foot tunnel, and is apparently inexhaustible. The mine is located on Pena creek, three miles from the mouth, and about nine miles northwest of Healdsburg by the road. It is easy of access, and there is every prospect for a rich mine in that section. Dr. Forsman has made three tests of the ore; the first, of best quality, showed a value of 30% copper; the test of second quality, 20%; the third quality, 10%.

TULARE.

CENTENNIAL DISTRICT.—Visalia Delta, Feb. 24: Mr. Sargent, who resides on Mill creek, about 40 miles northeast of Visalia, and near where the gold mines were discovered last fall, informs us that there are now between 60 and 70 miners in the district, which is named Centennial. There is sufficient water at present to work the claims in the bed of the creek, but that cannot be done for the gulches. The parties working what is termed the old claim are said to have sold seven or eight ounces of dust in Visalia. Other parties contemplate trying their fortunes in these mines shortly.

Nevada.

WASHOE DISTRICT.

TROJAN.—Gold Hill News, Feb. 23: The north winze below the 200-ft level is down 75 feet, all in ore which will mill \$40 to the ton. The south winze, 200 feet further south, is down 80 feet in \$32 ore. A large amount of good pay ore is developed in the 300-ft level, and in the

level above—the 240-ft level—the ore vein is 35 feet wide. These developments give good promise of a large ore body at the 400-ft level at which that shall be reached and opened. There is about 1,200 tons of good pay ore in the dump ready for milling.

DAYTON.—On the 220-ft level the ledge 500 or 600 feet north of the shaft was very badly broken up. The north drift, however, has followed the line of the ledge until it has concentrated and has the appearance of opening out into a fine body.

ALLEN.—Work in this old mine, between the Sierra Nevada and the Utah mine, is being actively pushed ahead under the efficient direction of James O'Donnell, who has been appointed Superintendent. Forty men are employed, and 50 tons of ore per day is being extracted, which is being reduced at the Western State mill. This ore comes from the 800-ft level, where there is a large amount of it in sight. The shaft is 1,000 feet deep, and the mine is not troubled with water, being drained by the deeper workings of the Utah mine near by.

OVERMAN.—Sinking the winze below the 1200-ft level is going steadily forward, the bottom still in good ore. The working station at the 1300-ft level is completed.

GOLD & CUREY.—The line of new pumps will be completed ready for use in a very short time. The mine never before was in as fine working condition as at present.

OPHIR.—Putting in the new pumps is completed from the 1000-ft level up to the 700-ft station. The old pumps have been taken out from the 700-ft level to the surface, ready to put in the new. While this is being done, the flow of water will be kept down with bailing tanks. The new pumps are of 14-inch diameter, and will be capable of draining an immense flow of water, should such be found on the lower levels. The putting in of the pumps will stop for the time being the use of the air compressor and blower, so that men will not be able to do much labor in the lower portions of the mine until the pumps can be started up.

IMPERIAL CON.—The connection of the north and south drifts on the 2135-ft level has greatly benefited the ventilation in that portion of the mine. The connection of the winzes and the south drift connecting with the Yellow Jacket, is furnishing as perfect a circulation of air as it will be possible to obtain until other winzes are sunk and connections made.

LADY WASHINGTON.—Sinking the winze below the 850-ft level is being pushed rapidly forward. The face of the north drift on the 850-ft level running toward the Overman, is in an excellent character of quartz and low grade ore.

BULLION.—The water from the east drift on the 1600-ft level has so decreased as to permit resumption of work in the face. The flow has been well taken up in boxes, in which it is carried through the Imperial mine to the Yellow Jacket shaft, through which it is taken by pumps to the surface.

BALTIMORE CON.—Sinking the north winze below the 1050-ft level has been suspended for the present on account of the flow of water. The quartz and ore in the face of the north drift on the same level is showing a steady improvement. The face of the main northeast drift on the 1400-ft level is showing some quartz and clay mixed. The flow of water from the face of the drift is steadily on the increase.

HALE & NOURCROSS.—The completion of the repairs to the main shaft on the 1900-ft level, connecting with the Savage, and the winze from the level above, has given a great impetus and greatly needed circulation of air through that portion of the mine. The water is being again gradually lowered in the main shaft.

KICKERBROCK.—The water in the shaft is being steadily reduced, and the 600-ft level will soon be reached if the machinery continues working as well as it has done thus far.

INJUN CON.—Sinking the north winze below the 1300-ft level is being fast progress, the quartz in the bottom being steadily on the increase in both quantity and quality.

SILVER HILL.—The new pumps are in and make the work of keeping down the flow of water at the bottom of the main incline much easier than it ever was before. Sinking the main incline has been resumed. The north and south lateral drifts on the 850-ft level are steadily advancing in a very favorable ground, running nearly parallel with the ledge.

YELLOW JACKET.—Both of the east cross-cuts on the 2040-ft level are steadily advancing, the face of each in favorable ground. Sinking the north winze on that level has been resumed, in order to reach and prospect the 2140-ft level. The new shaft is now down 530 feet. The face of the bottom is still in good ground.

WARD.—Sinking the shaft is being pushed vigorously, the bottom still in very favorable ground. The main south drift on the 1000-ft level of the Julia shaft is being pushed ahead with steady vigor, the face in soft porphyry, mixed with streaks of quartz.

JUSTICE.—Daily yield, 355 tons of ore, keeping the mills running up to their full crushing capacity. The output of 400, 600, 700 and 800-ton levels show but little change. The main southeast drift on the 1000-ft level has made but slow progress on account of the steady flow of water and bad ground encountered.

HOMESTEAD.—Good progress has been made during the past week in sinking the shaft. The formation in the bottom has changed to clay, intermixed with quartz of a fine character, which gives good assays in both gold and silver. It is the intention to soon commence the erection of hoisting machinery in order to expedite the sinking.

CHOLAR-POTOSI.—Daily yield, 100 tons of ore. This ore is taken from the stopes on the old upper levels of the mine. The east drift at the 1785-ft station is steadily advancing toward the ledge, the face in very favorable ground. Sinking the combination shaft is going steadily forward.

SIERRA NEVADA.—The prospecting drifts at the 1700-ft level, both north and south, are being pushed ahead with the usual energy. The south drift is showing more quartz.

MEXICAN.—Owing to the disarrangements caused by the putting in of new pumps at the Ophir shaft, the work in this mine has been confined for the past day or two to driving the east drift on the 1300-ft level.

BEICHER.—Daily yield, 125 tons of ore. Sinking the main incline is making steady progress. Sinking the drain shaft is making the best of progress. Opening the 800-ft station is also making good headway.

PROSPECT.—The water in the north lateral drift having subsided, drifting is resumed in that direction, following some excellent ore indications.

MINT.—Sinking the main shaft for a sump previous to starting the prospecting drifts on the 1400-ft level is nearly completed. Everything in and about the mine is in splendid working condition.

JULIA.—The main south drift on the 1600-ft level is steadily advancing, the quartz and ore in the face showing better and more favorable indications. The assays grow better as the ledge is prospected to the southward. The main south drift on the 1800-ft level is also showing better ore in the face.

LEVITIAN.—The face of the drift running north from the bottom of the incline below the 600-ft level shows streaks of ore, and is evidently nearing the ore vein descending from the ledge above.

CALADONIA.—Sinking the shaft below the 1400-ft level is being pushed vigorously forward. The north drift on the 1400-ft level is also making excellent progress toward the ledge.

SOUTH COMSTOCK.—Excellent progress is being made in sinking the shaft deeper, the work being pushed forward with a vigor and with a speedy practical development of the ore resources of the mine.

PHIL SHERIDAN.—The main east drift on the 400-ft level is steadily advancing toward the ledge.

NORTH CON. VIRGINIA.—The prospecting operations on the 1100-ft level are being prosecuted with all possible vigor.

ITAL.—Drifting for the purpose of prospecting the ore vein at the 1100-ft level has been commenced in good earnest. The pumps are all down to the 1100-ft station, and the mine is in excellent working condition.

Mica.

From Breslau, a city in Prussia, ranking in population next to the capital, Berlin, and an important industrial center, the *Alta* received the following communication:

"On several occasions your esteemed journal spoke of deposits of mica discovered in California and the Pacific States. Such discoveries are of considerable interest to many people here, owing to the extensive employment of this mineral in our city, where, for the last 15 years, Mr. Max Raphael has occupied numerous workmen in the manufacture of articles for ordinary and everyday use, as well as for scientific purposes, made either wholly of or combined with mica. He is doubtless the largest manufacturer in this particular branch in Europe. The peculiar properties of mica fit it for a number of purposes for which other substances do not answer. We learn from our townsman, Mr. Raphael, that formerly he imported large quantities of mica from the United States, but was compelled to cease on account of the constant increase of the price by Boston and New York dealers. Having found cheaper sources in other countries, he is now obtaining his supplies from them, though the mineral is inferior in quality to the American. He states his willingness to import anew from the United States, if it can be done at reasonable rates. In such event, and as soon as pending contracts with other countries expire, he will engage large quantities, to be shipped to him from any port of the United States, either Pacific or Atlantic, though he will require some guarantee as to steady supplies and at uniform rates. Many of the objects manufactured by him of mica can be likewise made of glass, especially of the recently-invented "tough glass," unless the price of mica is reasonable, it cannot exclude such competition. Once superseded by toughened glass, mica would no longer pay to be mined, and, except for a few scientific purposes, become valueless. A price such as several dollars, or even one dollar a pound, is out of question. It may be paid by a scientist, who needs a few pounds for making experiments and who requires select specimens for particular study. As for merchantable mica, even of the best quality, the waste in working it at the factory is from 33% to 75%, and the wastage is not worth a dollar per hundredweight. The price at which Mr. Raphael is obtaining his supplies at present varies, according to size and quality, from 10 cents to 75 cents per pound. To form a correct estimate of the quality and value and to enable him to contract for large quantities, Mr. Raphael requires sample lots of about 200 pounds of the raw material, just as it comes from the mine, only freed from coarse and stony matter. The pieces should be left in their natural shape, not trimmed or squared nor split up. Mica of good quality has the following characteristics: If the top layer or stratum, generally stained by foreign substances, is removed, the one beneath, when split off, should be of crystal-like transparency, while the body of the piece, in all its thickness, should show a reddish hue, with mirror-like smoothness of surface. To the touch it must feel hard; softish mica, though ever so transparent, does not serve for manufacturing purposes. Finally, the layers or strata, when separated, should be free from flaws or air-bubbles."

With reference to the above communication, any one interested in the mining or export of mica can be furnished with the full address of the Breslau manufacturer by calling at the office of the *Alta*.

The Mines of Owyhee.

The great want here at present, says the *Avalanche*, in order to effect a more systematic development of our mines, is capital. Judicious and economical management must also of necessity follow the investment of capital, otherwise the results will be, as has been too often the case in the past, most unsatisfactory to all concerned. Not only the miners of this camp have been serious sufferers by this mismanagement and failure to meet obligations, but the merchants and business men of the place here and in the vicinity have been directly and indirectly very heavy losers from the same cause. Reform, economy and vigilance should be the watchwords in all future operations. There is not a mine on War Eagle mountain but if worked judiciously would yield handsome returns to the owners. Experience, the opinions of men practically acquainted with the mines and past operations, fully justify this assertion. There is no reason why the Idaho mines should be in "bad odor" in San Francisco. If they are it is not the fault of the mines or the workmen. Better mines than those of Idaho exist nowhere in the world, and if the companies owning valuable works on the mountain have any doubt about it, that doubt ought surely to be removed when they see and know that rock has been taken out of nearly all of these mines recently none of which has yielded less than \$200 to the ton and much of it far in excess of that. This prejudice against our mines is the outgrowth of mismanagement, for which the people here are in no wise responsible. With the settlement of past indebtedness on a fair basis, and the resumption of work under competent and careful management, we feel justified in saying that there is no mining region on the Pacific coast that offers a more promising field for future operations than that of Owyhee. The subject is deserving of immediate and earnest attention at the hands of outside capitalists, who are inter-

ested in mining property here. What has transpired here during the past few months in the limited operations that have been in progress in some of the mines, and the movements that have been made in the way of relocating, by parties on the ground, constitute sufficient reason for immediate action. Our mines to be worked successfully must be developed systematically, and every practical man knows if a mine is worked by a few men taking out choice pieces of rock here and there it must be to the ultimate detriment of the property and not conducive to permanent benefits or profits.

A Well Appointed Gravel Claim.

The following is from the *Trinity Journal*: We last week visited the well-known claim of Chapman & Fisher at Arkansas Dam. We never visit this claim without a genuine feeling of admiration for the enterprise of its proprietors. We do not hesitate to say that it is the best appointed claim in the county, and that many of our miners could not fail to profit by a visit to it and inspection of the method in which it has been developed. The claim has been worked successfully for several years; last year the water held out so well that the yield was much greater than before, added to which it was in far better shape for successful working. Thus far this season the water supply has been light, but a considerable ground is already stripped and we do not doubt the claim will give a good account of itself in the spring.

The great obstacle to rapid work has heretofore been the number and size of the rocks which are found the whole depth of the bank. These large rocks are so numerous that a force of half a dozen men is kept constantly employed in blasting and breaking into pieces small enough to pass through the flume. The firm is now engaged in the erection of a derrick by which it is hoped that a great deal of this blasting and breaking will be avoided. The sweep of the derrick will have a swing of about 70 feet, and it will be set as close to the bank as possible. We understand the cost of this improvement will be in the neighborhood of \$2,000.

The claim is run night and day, the water being turned from one "giant" to the other or put on and shut off without leaving the bedrock. The reservoir is also opened and shut by means of a windlass, greatly simplifying night work. With a pressure of nearly 200 feet on the "giants" they do great execution in the heavy gravel bank.

We went into the bedrock ditch and flume, which are on a scale commensurate with the character of the mine. The flume is six feet wide and the principal under-current 24 feet. A new under-current was put in this year leading out of the upper flume. The yield from the under-current last year was in the neighborhood of \$3,000, most of which would have been lost without it. Starting from the main bedrock ditch the firm has run a bedrock tunnel the past summer which taps the bank 240 feet to one side. In this tunnel a flume is laid lined with rocks, ready for use as soon as the bank is washed away to where the "incline" comes through the rock.

FROM GOLD BEACH.—A letter just received from Big lagoon, above Trinidad, concerning the tests being made of the gold bearing sands of the beach at that point, contains information of a highly flattering character. Every experiment heretofore tried, and there have been several, looking towards the development of these mines and the devising of methods for saving the gold, which is almost of impalpable fineness, has been attended with indifferent success, yet every one has afforded more convincing proof that the sands are rich in gold, that the deposit is inexhaustible, and that the means and appliances for saving the gold are only wanting to secure the stores of wealth that exist there. Quite a number of our prominent citizens are interested in these mines and they have expended considerable sums of money in the attempt to develop them. It seems that, for some time past, the proprietor of a gold saving invention has been experimenting with his invention at this mine, and it is with reference to the result thus far obtained that the letter alluded to speaks. We are told, without going into detail, that the best anticipations are being realized, and that it is believed a sufficient test has been made, both of the appliances to save the gold, and of the richness and extent of the gold bearing sands, to warrant extensive operations for the development of the mine. We are certainly glad to hear this cheering intelligence, and hope the time is near at hand when those who have expended so much of their labor and means, will receive rich returns therefrom.—*Humboldt Times*.

MAKING MONKEYS USEFUL.—It will amuse and surprise our little folks to be told that these mischievous creatures can be taught to work; and yet they are tamed and made to work in two remarkable ways, in the East. First, in the tea-gardens of China, just as an experienced Chinaman works, picking the suitable leaves and letting the others be. In the second place, he has been taught, by the natives of Molacca and the Golden Chersonese, as far as Formosa to the East, to ascend trees, gather the fruit which is ripe, and either give them or throw them down to his master. It may be confidently asserted that in each of these cases the trained ape performs an office requiring more intelligence than that of a chimney sweeper or a crossing sweeper.

Salt Cave Discovered on the Klamath River.

Last week Ike Gayheart and Sam Williams discovered a great natural curiosity, in the shape of a salt cave in the bank of the Klamath river, about a mile north of the Oregon line. They were out hunting and following the tracks of animals and were led to the bank of the river, where close to the water's edge and at the foot of a high and steep precipice they saw an arched opening. Their curiosity prompting them to investigate and see what was on the other side of this "hole in the wall," they passed under the archway and found themselves inside a large cave, apparently round and with arched roof. The sides of the cave were covered with a substance of sparkling whiteness, while in the center of the cave boiled up a spring of water. Upon examining and tasting the substance encrusted on the sides of the cave, they found it to be salt, or very strongly impregnated with that article, and the waters coming from the spring were also found to be very strongly impregnated with salt. They broke a quantity of the white substance from off the walls and brought it away with them. Mr. Corpe, the mail carrier, brought some of it to town, and left a quantity at Dewitt's drug store. Dr. Robertson and Dewitt, who have tested it, declared it to be nearly pure salt, of very fine quality and with but little if any impurities in it. It is Dewitt's opinion that the water of the spring must be very strong in saline matter and that it is very valuable, as salt can be made from it with hardly any expense. The cave is situated on the south bank of the Klamath river, and Messrs. Gayheart and Williams describe the inside as a scene of grandeur and magnificence, and well worth going miles to see.—*Yreka Union*.

Origin of the Mission Grape.

Le Roy Gomez writes from the Sandwich islands to the *Bulletin* concerning the origin of the Mission grape as follows: Universal tradition among a people, if not history itself, must be accepted as the basis of history, and a residence of many years in Mexico, and a thorough inquiry relative to the origin of the grape in that republic, has resulted in the conviction that the Mission grape is indigenous and originated in the wild grape of northern Mexico.

The colonial policy of Spain prohibited the cultivation of the grape and the manufacture of wine in all of her American possessions. The vine was never introduced into Mexico during the colonial dependency from any part of Europe. Its cultivation was contraband, and the little that was carried on was done clandestinely by the priests in the more northern missions.

After the expedition of Coronado had awakened the spirit of adventure toward New Mexico, various military expeditions were sent out in that direction. One of these expeditions in traversing the vast region known as the Balson de Mapemi, discovered among the hills in which arise the springs that form the stream flowing into the Laguna de Los Pallas, a quantity of delicious grapes growing wild. From the trailing of the vines over the rocks and trees, they called the place Pallas. On their march northward they came to the source of the Rio Concha, which flows into the Rio Grande del Norte. There they also found grapes of the same variety growing wild, and they called the place Pallas, a name also significant of the trailing of the vines.

From these two sources spring all the grapes in Mexico, including the Mission grapes, which, according to tradition, were brought overland from El Paso del Norte to California.

LITTLE YORK.—This mining camp, although surrounded by rich and extensive gravel mines, which are worked on a large scale, and having numerous families in its locality, besides a large population of miners, the business part of town is nevertheless true to its name, being quite little; consisting only of one hotel and two saloons, in one of which is the postoffice. This is owing mostly to two causes, one of which has been remedied lately by the paying off of an \$85,000 debt, contracted by the company owning the mines, in running extensive bedrock tunnels, laying strings of iron pipe miles in length, building reservoirs, etc., which took two years to accomplish. During which time the money taken out of the mines was principally used in paying off outside indebtedness. The workmen did not receive sufficient to pay their board, nor the merchant enough to pay interest on what he sold; and to cap the climax on this gloominess, the business part of the town caught fire on the 5th of July last and was entirely consumed, from which it has not yet recovered. The parties owning some of the principal buildings declined, or were unable, to rebuild or furnish any more goods, until the mining company settled with them. This has been accomplished, but so recently that they have concluded not to rebuild before spring. The mining company have paid off all their indebtedness, and have a surplus remaining in their treasury. Their mines are fitted up in splendid condition, and are all now running. The miners receive their wages on the first of each month, and although York does look somewhat dilapidated at present, the business has again revived, the people are all feeling happy, and from her bright prospects in the future we expect to chronicle her among our liveliest mining towns for years to come.—*Dutch Flat Forum*.

The Great Eastern Quicksilver Mine.

The *Russian River Flag* says: Isaac Gum, President of the Great Eastern mining company, the office of which is located in this city, called at our office a few days since, and donated to our cabinet of specimens from the local mines, a piece of cinnabar that will assay about 30% of mercury. Upon inquiry we gained the following interesting information, which will encourage those who look upon the success of our local mines as all-important.

The first work of the company was devoted to the reduction of a class of soft cinnabar; but underneath this there was a vein of harder but much richer rock. Having got out enough of the first ore mentioned to keep their furnace supplied for some time, the workmen were directed to uncover the lower ledge. On a recent trip to the mine Mr. Gum found that an excavation 16x24 feet and 70 feet deep had been made, and the bottom was upon the ledge. He descended and procuring a chunk of about 80 pounds weight, had it sent up in the bucket. Upon breaking it into specimens he found that it would average 30%, as per one piece which he brought to this office. He says that the blast has thrown out pieces of 400 pounds in weight that would assay equally as well. This will explain the very handsome product which is now being regularly shipped from that mine.

While the rock run through the furnace does not average the enormous amount of 30% of quicksilver, he claims for the Eastern that its newly opened ledge has less barren rock in it, that the metal-bearing rock is in larger bodies, and is freer from seams, than any other mine in this part of the country. The ledge is near 100 feet in width (from wall to wall) and is longer, he believes, than any other ledge in the county.

Monte Diablo Coal Mines.

In a recent article we published the amount of coal that has been extracted from the Monte Diablo mines since 1860. Since the latter date two flourishing towns have grown up, Somersville and Nortonville. It now seems probable that the former will lose much of her former prestige, as we learn the contract between the Black Diamond and Pittsburg companies, under which the mines have hitherto been worked, has been cancelled. Eight years ago a contract was entered into by the parties mentioned to divide the products of the two mines into eleven parts, in the ratio of six to five, the Pittsburg to receive five-elevenths and the Black Diamond six-elevenths of the proceeds. The quality of coal for some time past extracted from the Pittsburg mines has been inferior to that of the Black Diamond, and the latter company objecting to its further use, on the 14th inst. an agreement was entered into between the parties by which the existing contract, which would not have expired until July 1st, 1877, is terminated. The result will probably be a suspension of work in the Pittsburg, at least for the present. While the effect of this agreement will have a tendency to depress business at Somersville, it will have a contrary effect at Nortonville. It will necessitate the extraction of about 2,000 tons of coal per month in addition to the present amount, which will increase the working force and consequently aid in the business prosperity of the town. The plan of running a tunnel to drain the surplus water of the mines is being considered, and should it be adopted no doubt it would give a new lease to the Diablo mining interests.—*Antioch Ledger*.

The New Stars of 1876.

The number of new planets discovered during 1876 was 12. We give the following complete list from the *Athenaeum*:

No.	Name.	Discoverer.	Date of Discovery.
158	Koronis.	Knorre.	Jan. 4th, 1876.
159	Emilia.	Paul Henry.	Jan. 26th, "
160	Una.	Peters.	Feb. 20th, "
161	Athor.	Watson.	April 16th, "
162	Prosper Henry.	Perrotin.	April 21st, "
163	Erigone.	Paul Henry.	April 30th, "
164	Eva.	Peters.	July 12th, "
165	Loreley.	Peters.	Aug. 10th, "
166	Rhodope.	Peters.	Aug. 17th, "
167	Urda.	Peters.	Aug. 28th, "
168	Sibylla.	Watson.	Sept. 27th, "
169	Zelia.	Prosper Henry.	Sept. 28th, "

No. 162 still remains nameless. Of the discoverers, Knorre resides at Berlin, Perrotin at Toulouse, and the Henry brothers at Paris. Peters and Watson have well maintained the honor of the country in this line of discovery during the year, and America still leads the world in the number of planets she has given to science.

THE SANTA ROSA COAL MINE.—Dr. Henry, a mining expert well known on this coast, has been in Santa Rosa recently, making an examination of the coal mine in Taylor or Cotate mountain, about three miles from town. He reports an excellent prospect. The vein measures 19 inches, with well defined walls. He pronounces it a true fissure vein of coal. Dr. Henry advises the company to follow the vein 100 feet further, and then start a level and cross-cut. He thinks the vein will widen to three or perhaps four feet, and the vein would then be of great value. The quality of the coal, he says, is not equalled on the coast, except from the Wellington mine in Vancouver. It is a very superior lignite, and it will coke a little, but not enough for a gas coal. For steam and domestic purposes it is not surpassed on the coast. This is a statement of the facts about the mine just as they exist.—*Sonoma Democrat*.

Educated Fleas.

We are supposed to know something about fleas in this State, but it cannot be doubted that our acquaintance with them is rather practical than scientific. We can perhaps supply our deficiency in one branch of flea science by reading a few paragraphs from an article on "educated fleas" which W. H. Dall writes for the *American Naturalist*. Mr. Dall is a member of the California Academy of Sciences, and was a resident of this coast for several years. He is now connected with the Smithsonian Institute.

Some weeks ago, when passing through Broadway, New York, not far from Union square, an accidental glance caught the sign over a doorway, "Exhibition of Educated Fleas." Past memories and present curiosity determined me to make an inspection at once. Half an hour later I had seen all there was to see, purchased a lively little pamphlet by—shall I say the inventor of the educated fleas? and decided that the small fee exacted was well expended. As it does not appear that the *modus operandi* of this exhibition has ever been explained, an attempt in that direction may not be uninteresting.

To make the explanation intelligible it will be necessary to begin with the conclusion, or in other words to first state the essential part of the explanation.

First, the fleas are not educated.

Second, all the performances which make up the exhibition may be traced directly to the desire and earnest efforts of the insects to escape. It is said that the constant raps which it receives, when attempting to jump and thereby hitting the sides of its prison, incline it to work. If this be true, and it might readily be tested by experiment, the flea's education is entirely comprised in it, and, so far as it goes, it is a species of training. I am not yet convinced of the accuracy of the statement.

It was noticeable that the surface over which the fleas dragged their burden was composed of compact blotting paper on which their hooklets took good hold, and that whenever the performance of any one individual was not going on, the particular object to which it was attached was laid on its side, or so that the insect was left, feet in air, where it could not exhaust itself by unnecessary efforts. I think that the absence of any proof of education in the above cases is quite plain.

In the second class of cases the efforts made by the flea to escape are precisely the same, but, being fixed itself, it must necessarily show its power by traction upon some movable object or by aimless gesticulations in the air.

Generally the insect is attached to a sort of style or wire in a perpendicular position, with the head uppermost and the limbs extended horizontally. Usually it will remain quiet, but if disturbed means employed to give an appearance of intelligent action to these struggles are sufficiently ingenious.

In the first place, each flea is attached to some object in such a manner that it cannot free itself, while the movements of its legs and feet are not hindered or embarrassed.

This was explained by the proprietor. The surface of the insect is so polished that no cement will adhere to it when dry, and should a soft or waxy substance be used the insect dies very soon. (A probable cause of this might be the obstruction of the stigmata.) He stated that by tying a single silk fiber around the flea and knotting it on the dorsal side, a bristle, fine wire, or what not, may be cemented to the knot. I was not able to observe exactly where the fiber encircled the insect. This part of the process is the most delicate and difficult to perform.

The first preparation for their task is stated to be as follows: The wild flea is put into a small pill-box with a glass top and bottom, revolving on an axis like a lottery wheel and forming a miniature treadmill. After a few days' confinement herein, the flea, which in a state of nature is, as we know, excessively inclined to jump, becomes broken of the habit, turbed by the vibration of its wire, as produced by knocking on the table, it will work its limbs about, seeking something to take hold of. If, then, segments of finest wire, fans of tissue paper, or other representations of objects in miniature are attached to its fore "feet," we shall have it apparently brandishing a stick or sword, fanning, performing on a musical instrument, etc., all of which is much more clearly seen with the aid of a lively imagination.

Two fleas furnished with segments of finest wire on their fore "feet," and placed with their ventral sides so near that the mimic swords can touch, but not the insects' feet, give a representation of a duel not much worse than that usual in most theaters. In their struggles to reach the adjacent objects, it would be strange if the little wires did not clash occasionally.

The most amusing and, at first, most incomprehensible of the various performances, is that of the dancing fleas. The orchestra are placed above a little music-box, whose vibrations cause them to gesticulate violently for a few moments, fastened as they are to their posts. Below them several pairs of fleas (fasten by a little bar to each other in pairs, those of each couple just so far apart they cannot touch each other) are apparently waltzing; an inspection shows that the two composing each pair are pointed in opposite ways; each tries to run away, the "parallelogram of forces" is produced; the forward intention, converted to a rotary motion, ludicrously imitating the habits of certain higher vertebrates.

USEFUL INFORMATION.

Rope Gearing.

We find in the *Hydraulic Engineer* a careful article by Mr. James Durie on the advantage of rope gearing for the transmission of large power in mills and factories in the place of the toothed gear which is in common use. We shall quote a few paragraphs:

In the case of rope gearing, the ropes by which the power is transmitted consists of an elastic substance, and their lightness, elasticity and comparative slackness between the pulleys are highly conducive to their taking up any irregularity that may occur in the motive power. This accounts for the slight attachments that are required for shafting driven by ropes from a grooved fly-wheel; and it is the same with all the bearings throughout the mill, the shafts in the various flats only requiring a light wall box, bracket, or the bearing may be carried on a column of the mill. The cost of fitting up a mill with rope gearing is considerably less than with tooth gearing, when the shafts to be driven revolve at a high speed, but the cost is about the same in other cases. It is, however, rather difficult to give exact figures for this comparison, one great saving being in the foundations of the engine, the wall boxes, and the extra strength of the walls required for upright shafts.

The great advantage of rope gearing, however, is the entire freedom from any risk of a breakdown; when a rope shows symptoms of giving way—and ropes always give symptoms of weakness long before they break, the weak rope can be removed and another put in its place at any meal hour or evening. The cost of the maintenance of ropes for transmitting 400 ind. h. p. has been found to be £20 per annum, or about £5 per 100 ind. h. p. per annum. This is made up of the cost of renewal of the ropes, and occasional wages for tightening them. Some ropes have been found to run ten and a half years, but as the general rule, the life of a rope may be said to be from three to five years, though even five years has been often much exceeded.

The friction of rope gearing has often been found to be, for high speeds, considerably less than that of toothed gearing; but the writer regrets not being able to give definite information on this point, which is a very important one to those contemplating altering their gearing or building new works. The reason why no definite reason can be given—beyond the universal impression of those who have adopted them, that ropes require less power to drive than toothed gearing—is, that in all cases where rope gearing has been substituted, other alterations have been made at the same time, or the engines were, after the alteration, driven at an extra speed of 10 or 15 revolutions per minute. However, every one who has substituted rope gearing for toothed gearing, also agrees in bearing testimony to the great improvement and steadiness of driving obtained after the alteration, and that they are enabled to turn off a greater amount of yarns from the machinery in the same time. The tendency at the present time, with the introduction of shorter hours of labor and foreign competition, being to increase the speed of shafting and machinery, to be able by this means to increase the speed of the shafts must be of great advantage to those who own old mills, the toothed gearing of which is generally driven as fast as it is safe to drive it.

The ropes used for rope gearing are mostly made of hemp, carefully selected; the qualification of good rope being that the fibers are as long as possible, and that the rope should be well twisted and laid, and yet be soft and elastic. It is also very important that the ends of the ropes should be united by a uniform splice—the splice should not be of a greater diameter than the other part of the rope; to effect this object the splice is made about nine or ten feet long.

PRESERVATION OF BELTING.—In order that belting of cotton or linen should have both strength and flexibility, together with increased adhesive power, they should be thoroughly soaked in linseed oil varnish. If the belting be new, the varnish may be applied with a brush until no more will be taken up, whereupon it may immediately be used without any preparatory drying. After having been in use for some weeks, a second application of the varnish should be put on. Cotton or linen belting thus prepared will neither contract nor stretch, and will always be pliable and unaffected by change of temperature. The adhesion of the belt to the pulley is likewise increased by the varnish, while steam and acid fumes have no effect upon the belting at all. —*Maschinen-Constructeur*.

NEW SUBMARINE CABLES.—The latest important addition to our stock of submarine cables which now link country to country, and perform their work in the recesses of the ocean, is a duplicate line down the Red sea, from Suez to Bombay, the first section of which to Aden, has recently been finished; while the second, from Bombay to that place, is in course of submersion. When these are completed there will be a double submarine communication all the way from Cornwall to India, saving the short land-line through Egypt, and the value of this to our Indian communication can hardly be over-estimated. —*Ryland's Trade Circular*.

Artificial Leather from Cuttings.

The *Bayerische Industrie und Gewerbeblatt* publishes some particulars respecting the utilization of leather cuttings for making artificial leather. According to the Bavarian patent of Soren Sorenson, of Copenhagen, the cuttings are first cleansed, and then put into a machine and worked up into a fibrous mass. This is mixed with fluid ammonia, and the gelatinous material which results from this mixture is pressed into molds, or rolled out into sheets and dried; it is now a very hard and firm material, but non-elastic and soluble in water. In order to make it elastic and impervious to water, it is mixed with india rubber. The india rubber is crushed and well washed in a washing machine, consisting of a couple of grooved steel rollers, on which a jet of water plays. The india rubber is then dried and cut into pieces and dissolved by means of oil of turpentine, benzine or other fluids suitable for the purpose. The quantity of the dissolving matter is determined by the quality of the india rubber. Para india rubber will dissolve with four parts of the fluid, Central American scraps with three and a half parts, Guayaquil with three parts and African with two and a half parts. The india rubber in this state is then mixed with ammonia water, and in a close-shutting kneading machine stirred up with the leather mass. The mixing proportion is governed by the proportion to which the manufactured stuff is intended to be put. For instance, if intended for soles, 25 parts of solid india rubber, 67 parts of ammonia water, and 67 parts of leather; if for heels, 25 parts of india rubber, 80 parts of ammonia water and 80 parts of leather; if for inner soles, 25 parts of india rubber, 75 parts ammonia water and 90 parts of leather. After the kneading, which is continued until the mass is thoroughly homogeneous, the latter is either pressed into molds or rolled out into lengths and then dried; while being dried, it is subjected to progressive pressure, the degree of which is determined by the use to which the material is to be put, the heaviest pressure being applied to that intended for soles. When thoroughly and sufficiently pressed, the leather is dyed or glazed, or otherwise manipulated to imitate natural leather as closely as possible.

It is not to be doubted that this artificial leather may have all the appearance of the real article, but it is highly problematical whether the resemblance extends to its firmness and durability.

A NEW SUBSTITUTE FOR GOLD.—The French have introduced a new substitute for gold. It consists of 100 parts by weight of pure copper, 14 zinc or tin, 6 magnesia, 3.6 sal ammoniac, 1.8 burnt limestone and 9 cream of tartar. The copper is first melted, then the magnesia, sal ammoniac, limestone and cream of tartar in powder are gradually added separately. The whole is kept stirred for half an hour, the zinc or tin being dropped in piece by piece, the stirring being kept up till they melt. Last of all the crucible is covered and the mass kept in fusion for 35 minutes. The scum being removed the metal is poured into molds. The alloy is fine-grained, malleable and takes a high polish. It does not easily oxidize.

PASTE FOR CLEANING METALS.—Take one part of oxalic acid and six of rotten stone; mix with equal parts of train oil and spirits of turpentine to a paste.

GOOD HEALTH.

Don't Dwell on One Idea.

It is the full, steady, equable exercise of every mental faculty which is the only infallible guarantee of mental health.

Let every man and woman mature this idea well, and steadily guard against one thought, one pursuit, one exclusive employment, one hate, one love, one grief. Blessed is that providence which seldom sends a single trouble! It is fatherly beneficence which often orders another, to tear the heart away from dwelling on the one great calamity. It is single troubles which craze men. It is not the general student whose mind becomes unbalanced. It is not the man who has a great many irons in the fire at a time; it is not the worker who has more business than he can attend to; it is the man who has leisure to do nothing, it is the man who nurses the one thought wholly, who makes shipwreck of the immortal part. It is the one idea man who is without ballast, and we patronizingly excuse him by saying, "on every other subject he is a sensible person."

Asylum statistics force upon us the unexpected truth, that of all classes of inmates farmers make the largest, in spite of the fabulous health-giving influences of a farming life. Such a result can in no way be accounted for, except in the sameness of thought and pursuit. Another fact, quite unanticipated, is, that in an equal number of New England men and slaves on Southern plantations, the proportion of lunatics is five times greater among the whites; there are five lunatics to one among the negroes; it is because steady concentration in a limited sphere is essential to securing plenty from the stony soil of New England, so barren, indeed, that multitudes are driven from agricultural pursuits, and in patents and inventions eat out their minds.

Our farmer readers will very naturally in-

quire what we would advise as the most perfect safeguard against so lamentable a close of life. Unhesitatingly we respond—scientific agriculture; for there is not a quality of the mind which, in its far reachings, it will not make up and energize; for to be properly and most profitably pursued, it makes almost every other science subservient to it. Thus followed it is the most ennobling of all human pursuits, because it perfects the body and refines and elevates the mind. What we have said, therefore, at the commencement of this article, we desire to repeat at its conclusion with most impressive emphasis—don't dwell on one idea. —*Hall's Journal*.

Importance of Good Water.

No question can be of more importance, from a sanitary point of view, than that of the supply of wholesome water. It is known that water does not in itself change in character, but it becomes noxious as it is made the vehicle for conveying injurious matter. Hippocrates appears to have been aware of the importance of pure water, and moreover of the places for its selection, or as it has been stated, "upon the aspect of its sources as well as upon its elevation." Mr. Simon, of the medical department of the Privy Council, in his last report of 1869, stated that "the doctrine in general terms, that a vast influence is exercised over the health of the communities by the quality of the water which they consume, is one which, as far back in literature as any reference to such questions could be expected to exist, may be seen to have universal medical consent in its favor; and during long ages of history the common instincts of humanity were even purer and stronger than undeveloped science. Of the many invaluable additions and improvements which medical knowledge has received within the past quarter of a century, scarcely any can, in my opinion, be compared for present practical importance to the discoveries which have given scientific exactitude to parts of the above stated doctrine, and have enabled us definitely to connect the epidemic spread of bowel infections in this country with the existence of certain faults of water supply. Not only is it now certain that faulty public water supply of a town may be the cause of the most terrible epidemic outbreaks of cholera, typhoid fever, dysentery and other allied disorders, but even doubts are widely entertained whether these diseases, or some of them, can possibly attain prevalence in a town except where the faulty water supply develops them." Such may be said to be the testimony of one of the highest medical authorities in England. Authorities in other countries have likewise drawn attention to the importance of the purity of water supplies, and moreover, Professor Pettenkofer has shown that there are in some cases certain definite relations between epidemics of enteric fever and cholera and the state of the level of the ground water.

Diet for Consumptives.

Consumptives must see that their bodies are properly fed. They should not take food as a medicine, but as nourishment. They should have the very best things to eat they can get, and, fortunately, the best things are not always the most expensive or difficult to obtain. If it agrees, a cup of cream may very appropriately be taken every day by those who are inclined to consumption. Brown bread, and milk and cream, oatmeal and cream, eggs, with a moderate use of beef and mutton, good butter and mealy potatoes, will, of themselves, constitute a perfect diet. They should avoid nicknacks and fancy foods, and live on things substantial and nourishing. Fruits should be used in their season moderately. Consumption is a constitutional disease showing poverty of blood and poverty of healthy tissue, and this poverty must be eradicated. It can be done partially by such foods as are needed to build up a strong healthy body and carry on all its functions. Many physicians think that the disuse of fat is a cause of consumption, and they prescribe cod-liver oil, not as a medicine, but as a food, and, in many cases, it has proved useful. We think, however, that it is the sedentary and unnatural life people lead that has most to do in causing so much consumption, and that with this sedentary life comes a feeble condition of body and brain favorable to the disease. A wise physical education and abundant wholesome nourishment would dissipate half the consumption in the world, and the other half would soon be banished by some other means. Consumption is a disease to be avoided, not cured. —*M. L. Holbrook, M. D.*

FLUIDS OF THE MOUTH.—Dr. Hodson wisely calls attention in the *Medical Record* to the fact that, in any illness involving a feverish condition, the fluids of the mouth are constantly as intensely acid, as respects the teeth, as in any medicine administered by the physician; and, moreover, from the high temperature of the buccal cavity at such times, the power of these acids for evil is greatly augmented. Further, a direct consequence of these conditions is the especially rapid fermentation and decomposition of all food lodged between and around the teeth, and the consequent elimination of other deleterious acids. Dr. Hodson recommends rinsing the mouth with lime water, diluted according to the sensitiveness of the mucous membrane, and flavored with a few drops of wintergreen or peppermint to make it agreeable.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTION IN ADVANCE.—Postage paid—one year, \$4; six months, \$2.25; three months, \$1.25. Remittances by registered letters or P. O. orders at our risk.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:

Saturday Morning, March 3, 1877.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Ruins; Items of Interest from the Mines; Relocating Claims; The Sutor Tunnel, 129. Improved Quartz Mill; Mining City Lots; The Sweetland Creek Mines; The Miners' Wages Question; The Pacific Machinery Depot; The Gravel Mining Season, 136. Comstock Papers; River Mining; Utilization of Sewage, 137. Patents and Inventions; Notices of Recent Patents, 140. Mechanical Ore Concentration and Separation, 141.

ILLUSTRATIONS.—Ancient Ruins in Southwest Colorado, 129. Mining Scene in the Mountains, 137.

CORRESPONDENCE.—Mines, Sampling Mills and Smelting Works Around Salt Lake City; The Discovery of the Chollar Mine, 130.

MECHANICAL PROGRESS.—Looking for Defects in Boilers; Sales of War Material; John Adams Blake; Patents and Population; American Enterprise; The Steam Engine of the Future; The Largest Clock, 131.

SCIENTIFIC PROGRESS.—A New Insect; Lighting in Telegraph Offices; Conditions of Successful Scientific Work; Movement in Trilobites; "Sideral Photography," 131.

USEFUL INFORMATION.—Rope Gearing; Preservation of Belting; New Submarine Cables; Artificial Leather from Catfish; A New Substitute for Gold; Paste for Cleaning Metals, 135.

GOOD HEALTH.—Don't Dwell on One Idea; Importance of Good Water; Diet for Consumptives; Fluids of the Mouth, 135.

MINING SUMMARY from the counties in California, Nevada, Arizona, Idaho, Montana, Oregon and Utah, 133-140.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 132.

GENERAL NEWS ITEMS on page 141 and other pages.

MISCELLANEOUS.—Oregon Mines, 130. Mica; The Mines of Owyhee; A Well Appointed Gravel Claim; From Gold Beach; Making Monkeys Useful; Salt Cave Discovered on the Klamath River; Origin of the Mission Grape; Little York; The Great Eastern Quicksilver Mine; Monte Diablo Coal Mines; The New Stars of 1876; The Santa Rosa Coal Mine, 134. Educated Fleas, 135. Hints on the Making of Bread; Chicory in California, 138.

Note on Retorting Quicksilver.

When it becomes necessary to retort the quicksilver in a mill, I insert in the top of the retort an S tube, made of a piece of half-inch gas pipe. A pan in the retort is not essential. The closure of the retort is well luted with a stiff paste of ashes and water, to which a little salt may be added, and the luting is thoroughly dried by a gentle fire.

A few flasks of quicksilver are now poured in through the S tube, which is furnished with a funnel fixed to its upper end, and the fire is increased till distillation proceeds, after which a steady heat is maintained, the quicksilver which passes over being replaced flask for flask, by means of the tube, till all is done, when the retort is allowed to cool, and the remaining lead or other metal taken out. The lower curve of the S tube remaining full of quicksilver during the operation, forms a valve which, while allowing the passage of the liquid quicksilver into the retort, prevents the escape of vapor, which therefore finds its way to the condensing pipe. When the retort is used for amalgam the S tube, in which some quicksilver remains, forms a good safety valve to prevent explosion in case of obstruction of the condensing pipes.

C. H. A.

The News says over 2,000 men have left Virginia City and Gold Hill during the past month. Work being very slack there, they were compelled to seek other places. A good many of them have come back to California, and quite a number have gone to prospecting, when they could not get steady work on the mines.

An Improved Quartz Mill.

Oliver Allen, of Forest Hill, Placer county, has recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, a quartz mill of peculiar construction. The object of the invention is to provide a machine for crushing quartz and other substances by means of rolling weights. These rolling weights are applied and operated so as to avoid the objections to the Chile mill, or wheel system, in which connection the rolling weight principle has heretofore usually been attempted. These attempts, however, have so far failed to produce a crushing mill that will operate successfully and economically, principally because of the mechanical difficulties encountered in handling the heavy wheels required to do the work. In this machine the inventor operates the rolling weights by a direct or reciprocating motion, so that he obtains the benefit of direct action and reaction in the working effects of the weights on the ores in the batteries and he is also able to operate the weights by a direct or rectilinear motion. The batteries are a short distance apart and parallel with each other, and each one consists of a long box with the usual screens, etc. The rolling weights or crushers may be a wheel of the required weight and size or, preferably, a segment. Each wheel is made of the proper width to fit into one of the batteries so that its rim or circular face will rest upon the bottom of the battery. The circular face of each wheel is provided with suitable shoes, and the bottom of the batteries has dies, so that they can be replaced as worn out.

The chief novelty of the improved quartz crusher consists in imparting to the wheels a rocking motion inside of the batteries, so as to obtain the advantage, first, of operating them by direct application of power; second, by an increase of speed; and third, of subjecting the ore to the action and reaction of the weights, by which greater crushing capacity is gained. The weights are connected to each other by a shaft which passes across above the batteries and connects the central points of the weights about which the curved crushing faces are described. This shaft is permanently secured to the weights so that they may all move together. The machinery is so arranged that the rotation of the shaft imparts a rocking motion to the crushing wheels. A simple device prevents the crushing wheels from shifting their position, but allows them to accomplish a reciprocating, semi-rotary motion inside the batteries. This is necessary, as the centers of the crushing weights and consequently the shaft, are continually changing their position, and some device is required to hold the weights to their proper position inside of the batteries.

The battery is so constructed as to permit of an ore feeder being placed over it. To accomplish the feeding properly the upper or straight side of the crushing rollers is constructed with a central ridge and sloping side, so that the ore will be equally divided and fed upon each side. A scoop or round flange is constructed around the end and part of the sides of the ridged upper surface of the weights, so that the ore will be dropped at the center as the weights curve back, and not be fed over the end of the top. An arrangement is made so that as the faces wear away the weights can be lowered so as to preserve a uniform contact with the dies.

This machine can be used for crushing either by wet or dry process. For wet crushing the water is discharged under pressure into the battery so as to agitate the pulp while the crushing action is going on. In this machine the ore is subjected to the pulverizing action of rolling weights, and at the same time the machinery is capable of yielding to the necessary unsteadiness and inequalities of action required in a machine for crushing hard substances. The weights act and re-act upon the ore, thus accomplishing better results than when the crushing action is only given in one direction. The streams of water loosen up the pulp so as to present every particle to the action of the crushers and also assist in discharging the pulp. The rolling action of the crushers also assists in forcing the pulp against the screen. Ample means are provided for discharging the pulp as fast as it is reduced fine enough to pass through the screens. Grooves or channels will lead the pulp into the vessels or receptacles intended to contain it.

Mining City Lots.

There were a good many places in California where, in early times, the little mining towns were undermined in the search for gold. When it was found that the gravel channel ran under the town, the miners continued to follow the course regardless of town lots, streets or edifices. In many cases the towns were moved to one side on less valuable ground, leaving the miners the old town-site to work out. This, in any other country, would seem rather an anomalous proceeding. The idea of town lots being rendered more valuable for the contents of their soil than for their position or superficial area, seems somewhat strange. Under the circumstances mentioned, however, it is easily seen how such could be the case.

Although this digging up of town lots for mining operations was once more frequent than now, yet it is now by no means unfrequent. Only a few weeks since we called attention to

the fact that some one in Mokelumne Hill, Calaveras county, was mining in his garden and working on an old gravel lead. A similar circumstance is recorded this week in the *Mountain Democrat*, (El Dorado county), as follows: "The success of men who have been mining the Geo. Myers lot has gotten up quite an excitement in regard to mining city lots in central Placerville. Ed. S. Evans and S. J. Ford have set a line of sluices and made other preparations for working out the lot back of Culbertson & Co.'s furniture store. Another company has made a contract to work out the lot in the rear of Hunger's butcher shop, giving Hunger one-fourth of the gross proceeds for the privilege. George Myers, from the mining of his lot, will realize enough so pay for the new building he is about to erect thereon."

Although such circumstances as the above may appear improbable to people abroad, it is, as before stated, by no means a very uncommon circumstance in the mining towns in the interior of California.

The Sweetland Creek Mines.

We see by late London files that the Sweetland Creek mining company, whose property is located in this State, has concluded to wind up its affairs. This gravel mine is owned entirely in England, and of late they have been unsuccessful in their work. The mine has heretofore been worked at a profit, the last dividend of two shillings per share having been paid in June, 1876. It has paid altogether £3 10s per share on 150,000 shares. The owners have, however, known for some little time that they were apparently drawing near the end of profitable working. The directors, fearing a loss upon the last run, telegraphed out here to get an offer for the property. They were offered £2,000, which offer was afterwards increased to £2,400.

The side dirt, which the company looked upon as giving them a new lease of life for four or five years, disappointed them, as according to the Superintendent's report there was but very little chance of profit from it. A somewhat curious circumstance was that the manager of the property here, Mr. McLean, was willing to buy it and there was no competitor. The company tried to sell the outlet to an adjoining company, but they refused to buy. Very little money was spent on the plant by the company, although they bought the iron and made the pipe on the ground. Mr. McLean's idea in bidding was that, perhaps, if the price of water was reduced, he could work the side dirt at a profit, apart from which the mine was of no value. The general impression of the meeting held in London on the 1st ult. was that they were not justified in keeping up the organization. A resolution was offered and passed recommending the directors to dispose of the property of the company in California on the best terms possible and to call a meeting of the company to wind up, appoint a liquidator, and divide the assets. This being unanimously agreed to it was subsequently resolved to telegraph to Mr. McLean that the shareholders would accept an offer of \$15,000 plus the balance in hand (£600) subject to an immediate reply from him.

The Miners' Wages Question.

We understand that the miners' strike at Smartsville, Yolo county, still continues, and no changes have taken place since the first of the month, when wages were reduced. The miners still continue to refuse to work for two dollars and a half a day, to the hand, and they have formed an association of resistance to the action of the mine owners. The Grass Valley Union understands that the miners of the district will not allow any one to work at miners' work for less than three dollars a day. Both sides seem determined and the end is not difficult to predict. The mine owners have one big advantage in the matter this year. Water being scarce and the season promising to be very short, they say they can afford better now than ever to let their ground remain idle. Beyond preventing work by those who might do so for \$2.50 a day, the miners have exhibited no desire to use force to carry their point. At North Bloomfield, however, where wages were reduced on the first of the month, the Union says they have had no trouble whatever over the matter. It says: The miners are now working for \$2.50 per day, per man, and there are many applicants for work at that rate of wages. In fact, so far as Bloomfield is concerned, the supply of labor is much greater than the demand. We have heard nothing from French Corral for the last few days, but we understand that the reduced rate of wages still obtains in that place, and there are no hostile demonstrations by the miners who will not accept work at the lower wages. Chinamen down there are at work. At Bloomfield it is noticeable that the Chinamen who had their wages cut down, "all same Mellican man," did go on a strike for a day or two. At Smartsville the miners are still holding out, and the companies are also stubborn. The result is no wages and no work, and the water season running idly away. In quartz mining everywhere it is as it has been for years, the quartz companies paying regular wages at regular times.

The Pacific Machinery Depot.

The Pacific Machinery Depot, Messrs. H. P. Gregory & Co., has been removed from the old place on First street to new and much more commodious and convenient quarters in the fine new building on the corner of Market and California streets. The new locality is one of the best in the city. It is at the corner of the "money street" of the metropolis, and the principal thoroughfare—Market street. Close to the ferry lines, every one who comes to the city must pass the store. The quarters are commodious and attractive, and the goods are displayed in a tasteful style, and convenient for close examination. The new sales room is 46 feet front by 137 feet deep; the basement is the same size and is used as a store room. The ware rooms are spacious, light and airy, and afford an excellent place for the exhibition of samples of the articles dealt in by the firm.

Among these articles are the following: J. A. Fay & Co.'s wood-working machinery; Blake's steam pumps; Tanite Co.'s emery wheels and machinery; Bement & Son's machinist tools of all kinds; Sturtevant's blowers and exhaust fans; pure oak-tanned leather belting; Perins's French band saws; planers' knives; Nathan & Dreyfus's glass oilers; and mill and mining supplies of all kinds.

Messrs. Gregory & Co. are now sole agents for the New York Belting and Packing Company's line of rubber goods. This company is the oldest and largest of the manufacturers of vulcanized rubber fabrics adapted to mechanical purposes, in the United States. Among the articles manufactured by them are the following: machine belting, steam packing, leading hose, suction and test hose, wagon springs, billiard cushions, grain drill tubes, car springs, etc. The reputation of the New York Belting and Packing Company is too well known on this coast to require any comment from us. They have steadily adhered to their original policy on which they built their reputation—that of making a standard article which they could guarantee.

Among other articles, Messrs. Gregory & Co. keep several styles of portable engines. The Payne semi-portable engine ranges from two up to ten-horse power, and from \$250 up to \$850 in price for engine and boiler complete. These engines are intended for any of the uses to which portable engines are applied. Another new line of goods kept by the firm are the pumps made by the Gould Manufacturing Company. Innumerable styles of these pumps are made for hand or windmills, deep wells, ships, irrigating purposes, etc.

The new store of the Pacific Machinery Depot is certainly one of the handsomest in the city. The Messrs. Gregory started in a modest way only about two and a half years ago, on First street, in a single store. They then extended their quarters by leasing the store next door and throwing both into one. In time, for want of more room, they were compelled to increase their accommodations by laying a floor and making a two-story room of what they had. As their business has increased largely, however, and new lines of goods have been procured, they felt the necessity of moving to a better location with more spacious rooms. The present quarters are first-class in every respect, and the firm is to be congratulated on its success.

The Gravel Mining Season.

The supply of water in a good many mining ditches is failing, and the miners are again expressing fears of a very short season. This fear does not seem confined to any particular locality, but the state of the case is the same in all the gravel mining regions. Quartz miners never had more favorable weather, the season having been so open that work at mines and mills everywhere has progressed almost uninterruptedly. A large amount of prospecting has been done in various directions this winter—more, perhaps, than has been done for many years. Men who found no employment have gone into the hills prospecting, instead of sitting around growing about the hard times.

With regard to the scant supply of water for the gravel mines the Dutch Flat *Forum*, which is published in the immediate vicinity of many of these claims in Placer county, says: There is yet, however, ample time for a heavy deposit of snow in the mountains, which is the source from which our late water is received in the summer. Ordinary seasons the weather is so stormy during the months of January and February that but little profit is realized from washing. The various claims were in so much better condition for advantageous working than ever before, that with the water they have had since the season opened (Feb. 1st), they have been doing profitable washing, and not, as is usually the case, been obliged to spend thirty or sixty days on dead-work. Consequently, should we have late storms there is every reason to believe that it will prove one of the most profitable seasons we have had in many years in proportion to the number of days of water supply.

THE rates for telegrams from California to Europe have been reduced.

Comstock Papers.—No. 19.

Overdoing Matters at the Start.

Not only in the matter of mill construction did the pioneer miners on the Comstock greatly overdo things at the start. Their extravagant ideas about the mineral wealth of the country betrayed them into a variety of other equally fatal mistakes, such as the laying out of extensive cities at all supposed eligible points, the building of costly wagon roads over the mountains, the projection of gigantic tunnel schemes and the like, to say nothing of innumerable mining enterprises, backed by any amount of nominal capital. Within 18 months from the time that the Washoe excitement broke out more than a score of town sites had been surveyed at localities that were believed to possess such natural advantages as would speedily attract to them a large population, and render the lots there laid out exceedingly valuable. All the mineral and thermal springs within a hundred miles around had been seized upon under the impression that they could easily be converted into great sanitariums, whose wide-spread fame would at once attract to them swarms of invalids from every quarter. Through every pass in the Sierra Nevada between Sonora and the Downville buttes a toll road had been commenced and partially constructed, nearly enough money having been expended first and last on this class of improvements to have built a narrow-gauge railroad over the mountains. Before the end of the year 1861

Eighty six Companies, with an Aggregate Capital Stock of \$61,500,000.

Had been organized, the most of them having their headquarters in San Francisco, to open up and work the mines of western Utah, the era of excessively large capital and purely speculative mining having not yet been inaugurated. Only in one case, that of the Ophir, did the stock of any of these companies amount to as much as \$5,000,000. That of the Gould & Curry, next in magnitude, was fixed at \$2,400,000 and that of the Mount Davidson at \$2,000,000, none of the other companies on the list having reached the latter figure, the most of them having ranged from \$250,000 to \$500,000. Of all the companies incorporated during that period,

Only Nine Survive,
Viz.: Ophir, Gould & Curry, Sierra Nevada, Chollar, Lady Bryan, Hale & Norcross, Utah, Bullion and the Daney, the limits of some of these having since been so curtailed, extended or otherwise altered as to nearly destroy their identity. The claim of the present Ophir company, for example, covers but a fraction of what constituted the original Ophir ground, while the Sierra Nevada, the Chollar and the Daney embrace a good deal more ground than they did at first; the Chollar having absorbed what was formerly the Potosi and the possessions of the Daney having been extended for more than a mile north of their original location. On the other hand, a good many small claims have been aggregated, constituting one or more large ones, as in the case of the California, Consolidated Virginia, Empire-Imperial, etc. Some of these early incorporations, for one reason or another,

Enjoyed Quite a Fame in their Day.

The Burning Moscow, for instance, was for a time rendered conspicuous through the long and bitter contest which that company waged with the Ophir, the problem of the one ledge theory having for the first time come up for adjudication and forming the turning point in the fight. The Mount Davidson company, formed to drive a tunnel into the Comstock lode and open it up to the depth of 1,000 feet, was for several years a live and popular institution, the end proposed having been then considered a marvelous undertaking. The Latrobe was another incorporation gotten up for a similar purpose, both of these companies expecting also that they would intersect some valuable blind leads in the course of their excavations. In this, however, both were disappointed, though the Latrobe company did have the good luck to strike such an amount of water as afforded them for several years a considerable revenue, this being a very scarce commodity at that period about Virginia City. Before either of these tunnels had reached their objective point, the Comstock lode had been opened to such depths by other means that, their further prosecution being deemed unexpedient, both were abandoned, causing severe disappointment to multitudes who had bought the shares of these companies, believing them to be a safe and profitable investment.

"Vanished into Thin Air."

It was the case, indeed, that very few of the

many companies organized at this early day ever accomplished anything beneficial to the shareholders, nor did any considerable number of the other grand schemes then set on foot realize the fond hopes of the projectors. Not more than two or three of the many gorgeous cities lithographed and laid out ever advanced beyond that embryonic state. The medicinal virtues of the mineralized springs failing to be appreciated by the invalid public, these remained as before solitary Bethsheds in the desert. The most of the roads constructed over the mountains, being but little used, heavily burdened the slender finances of the counties and towns that had helped to build them, while of the mining claims located all over the country, not one in a thousand was ever able to make even a tolerable showing of mineral wealth. Of the multitudinous companies associated and incorporated, not more than a score or two have left any enduring record, all the rest having perished from lack of merit or sheer inanition during their earlier stages of development. The "Hope" gave up in despair; the "Excelsior" failed to get any higher; the "Sucker," having drawn scant sustenance from the pockets of the hapless shareholders for a while, succumbed to its fate; the "Scoria" turned out to be dross; the "Nescharama" perished from some unknown cause, probably lockjaw; the "Great Republic" collapsed, and "Congress" adjourned *sine die*, the doom of these companies having been seemingly foreshadowed by their names.

The Ups and Downs of the Past.

In January, 1862, a great flood occurring carried off many of the mills situated along Carson river, inflicting severe loss upon both the millmen and miners, the entire damage sustained by these two classes having been estimated at \$2,000,000. This event, in connection with the ill success that had attended the most of the prospecting enterprises engaged in, had a tendency to greatly depress the spirits of the mining community about this time. This despon-

River Mining.

The scene shown on this page is one which will appear familiar to many of our readers. It represents a view in the mining regions of the State, with the little camp of the miners nestled in a nook of the mountains near the river side. A flume has been built to carry the water of the river during its low state, so that the miners may be able to work the bed. The water wheel seen in the flume is for the purpose of affording power to pump, in order to keep the river-bed as dry as possible.

This system of mining was the principal one carried on for many years in California. But now it is confined to comparatively few localities. During the progress of ages the elements wore away the hills and carried them piecemeal into the rivers. The action of the water carried away the dirt but left the precious gold scattered over the bed of the river. Although the obstacles in the way of recovering it under these circumstances would seem almost insurmountable, yet the hardy miners found a way to get at the gold. As will be seen by the sketch, they built flumes large enough to carry the whole, or a large part of, the water of the river. Then they got down into the river-bed and worked it. When one part of the bed was worked out they shifted the flume and worked under the place where it was before. It must not be supposed that this was accomplished without great labor, trouble and expense. Sometimes the toil and trouble of months was lost in a single night. A sudden rise in the river would carry away the flume, the dam and all the costly works. Still in very many cases the miners who once succeeded in getting at the bed of the river made their fortunes in a very short time. Therefore this system has always been a favorite one where practicable.

Utilization of Sewage.

Although the American people introduce, experiment upon and perfect a great many thin which are afterwards adopted in the old world the experiments are not all upon our side. We are perhaps the best experimenters in the line of labor-saving machinery, etc., and seldom have to chronicle failure when once a start has been made. England, though conservative in many respects, also does her share in advancing the mechanical interests of the world, but is specially useful in proving the value and usefulness of "systems." She occasionally gives us the benefit of her experience in this direction, saving us much money and time by the thoroughness with which the investigations are carried out and reported on. In this way the two great nations help each other; the things proven valuable by either are adopted by both, and those which are failures with one serve as warnings to the other.

The latest lesson taught us by England is in connection with the very important question of the utilization of sewage for the fertilization of land. In this question the English people were very much interested, and exhaustive experiments, extending over a considerable period of time, with various systems and in many localities, have been tried. With this range of experience their conclusions are entitled to the utmost consideration. Inventors have had abundant opportunity to test practically their processes in this connection, as capital has been plentifully contributed to carry out the various systems proposed. Heavy joint stock companies were formed, thousands of pounds were invested; yet the verdict is now against the financial value of artificial sewage.

A commission has examined and reported on all the principal experiments now in operation, and its conclusion is that in no case has sewage yet been reduced to a marketable result capable of covering the cost of production. In the report the statement is made that "none of the manufactured manures made by manipulating town refuse, with or without chemicals, pay the contingent costs of such modes of treatment; neither has any mode of dealing with excreta so as to defray the cost of collection and preparation by a sale of the manure been brought to our notice. Town sewage can best and most cheaply be disposed of and purified by the process of land irrigation for agricultural purposes, where local conditions are favorable to its application; but the chemical value of sewage is greatly reduced to the farmer by the fact that it must be disposed of day by day, throughout the entire year, and that its volume is generally greatest when it is of the least service to the land."

After this report the numerous sewage-utilizing companies must soon fall into disfavor, although we see by the *British Trade Journal* that the shares of some of them are held pretty well up on the Stock Exchange, so there must be some source of vitality outside of the sewage business. This, however, only serves to illustrate the fact that the sale of shares without respect to the value of the property is not entirely confined to mining operations. The conclusions of the commission referred to above are of importance to us here, and the failure of the various schemes will serve our people as a warning against undertaking similar ones.

RICH STRIKE.—"H. C. C." writes us from French creek, Siskiyou county, that a rich strike has been made in the Hartstrand claim. Three Swedes bought an interest in the Hartstrand claim about two months ago, and commenced on a two-foot ledge in the old shaft. Sinking was continued until a depth of 60 feet was reached, at which point the rock had materially changed in appearance and prospected well. At the present depth of 70 feet the rock is said to be perfectly "saturated" with gold. The rock near the surface is white with spots of rust; they call it ribbon rock. At the present depth it is white and blue. The supposition of the owners now is that they have as good a claim as Cory & Ringery, when the same depth is reached. The latter claim is opened by a tunnel 180 feet below the surface.

THE STICKEEN MINES.—Advices from the Stickeen mines state that at Cassiar mining has been going on all winter, but that provisions are scarce. The Stickeen river is open for a distance of 150 miles from its source. The small-pox has broken out at Wrangel.

SIERRA COUNTY has a curiosity in the shape of a haunted mine—the Keystone.

MINING SCENE IN THE MOUNTAINS.

dency was, however, gradually removed by the developments that continued to be made on the Comstock lode, the mining interests of the country having been maintained in a prosperous condition for several years thereafter, when another season of depression and gloom ensued, to be followed in turn by an era of greater prosperity than ever before. From these events of the past a lesson of fortitude and patience should be drawn by those unfavorably affected by the stagnation now prevailing in the Comstock stocks, this ebb and flow of fortune appearing to be incident to the great Washoe lode.

THE SILVER COMMISSION.—The Silver Commission has finished its labors and a majority report by Senator Jones, and a minority report by Boutwell, will be presented to the Senate early next week. The majority report, which will be at once a statement, argument and information on the whole matter, will recommend the adoption of a double standard, making silver a legal tender for all amounts, and providing for unrestricted coinage. It will summarize all attainable facts in regard to the production and circulation of silver throughout the world. The actual product of the Comstock lode in Nevada will be tabulated from official reports, ranging back for years. The flow of silver to India and the Orient, and the amount of silver Germany has sold, and what she still has to sell will accompany the vast mass of statistical and political information to be offered in the majority report. The minority report will oppose the principal recommendation of the majority report, and will adduce facts in the history of the United States and foreign countries to sustain its conclusion.

FEBRUARY DIVIDENDS.—The mining companies represented on the stock boards paid out in dividends in February \$1,240,000, against \$1,368,000 paid in the same month last year. The Black Bear paid \$7,500; Consolidated Amador, \$7,500; California, \$1,080,000; Empire, \$10,000; Great Western quicksilver mining company, \$12,500; Idaho, \$22,500; Manhattan, \$50,000; and Northern Belle, \$50,000. The following companies paid dividends a year ago which did not this year: Alps, Belcher, Consolidated Virginia, Leopard, Lyon Mill, Redington Quicksilver and West Comstock.

The miners knew that nature had done for them what it would take a great deal of trouble and time to accomplish. She had separated in a great measure the gold from the debris and left them the comparatively easy task of gathering the precious dust. Many such scenes as that depicted in our engraving may be seen in mountain counties of California, although most of the practicable river-beds have been worked out. Now the miners have to wash away the hills themselves, and leave the rivers to carry away the debris only.

CLOSE MILLING.—The following from the Nevada Transcript will be appreciated by some of our mining friends: A party living 10 or 15 miles from here was the owner of a quartz ledge, which he supposed contained paying quantities of mineral. It was a large ledge and the foot and the hanging walls were as well defined as in any quartz mine in the country. He took out ten tons and had it hauled to this city to be crushed. Before starting it he bet \$20 with a neighbor that it would pay at least \$6 to the ton. To be sure and win his bet he came here while the rock was being crushed and bought of some one about \$30 worth of gold dust and put it in the battery. When the clean-up was made he obtained as a result \$6 less than he put in the battery. He lost his bet, lost the work of taking out the rock, the hauling, and was otherwise out of pocket. The joke was so good that he had to tell it, and now has a good time detailing the facts to admiring listeners.

THE "HARMONIC COMBINATION."—The "Harmonic Combination," just published by Gray, is one of the musical novelties of the age. It is the invention of Dominico Speranza, Director of the San Francisco Musical Institute of this city. We are informed that by the use of this work any one with a slight knowledge of music can compose airs of every variety, from a polka to a march. The system is simple and requires but little study to comprehend. Several beautiful songs, composed by Hector A. Stuart, are introduced as examples, being set to original airs. The work has been ably edited by a gentleman connected with the Italian consulate, and, on the whole, is an ingenious and elegant example of California skill, musically, poetically and typographically.

Hints on the Making of Bread.

As a most difficult branch of a housekeeper's duties, bread-making requires a generous stock of patience and a vast deal of experience. The skill of it is in no sense intuitive, but acquired through repeated failures and doubtful successes; and even the accepted recipe of many a housewife makes a poor apology for a perfect loaf of bread. The best of recipes gets hard usage in unskilled hands, and the indifference which much bread-making betrays would spoil any rule, and offend any table. Teaching is worth something, but in this, as in most other skilled employments, experience is everything. The Woman's Centennial Committee, who compiled the "National Cookery-Book," considered the chief evil of much bread-making to be the use of saleratus or other baking powder, and enjoin upon their sisters to do away with this vicious custom. Were there no such thing as saleratus, considering the uses to which it is often put, the dining tables of the present generation would perhaps offer a more wholesome diet, certainly more acceptable bread where such a powder is now used; and were the common and unhealthy biscuits, with their so frequently sulphur-streaked surfaces, which require special training of the stomach for even a passable digestion, driven away from every dining-room, the effect would be of immense importance.

Mr. Tegetmeier, in his "Handbook," explains the process by which bakers make their bread so light and spongy. They mix a little of the flour they are about to use with water and the yeast, and set it to rise some time before mixing up the mass of dough. In this way less yeast is required, and by this whole "sponge" acting as a ferment, the bread is much better and softer than is made in the ordinary way. The rising of the dough is quickened by adding to the sponge a small quantity of mashed boiled potatoes. To make half a peck of flour into bread on this system, mash three-fourths of a pound of well boiled mealy potatoes through a coarse sieve or colander, and mix with a pint of flour; mix an ounce and a half of German dried yeast, with a pint and a half of lukewarm water, and strain into the flour and potatoes; beat the whole into a batter; cover with a blanket and set by the fire to rise. In two hours, if kept warm, this will have risen considerably and constitutes the "sponge." Beat this with the hand very perfectly and mix with a pint and a half of nearly blood-warm water, (92° Fahrenheit,) and pour into half a peck of flour, which has already had one and one-fourth ounces of salt mixed with it. Knead the whole into dough and let rise in a warm place—two hours in warm weather, but longer in cool weather. Then turn out on a floured table, divide into pieces suitable for loaves, and knead lightly into proper shape with only flour enough to keep it from adhering to the table. For a still lighter bread a portion of the dough, when ready for the oven, should be well kneaded with flour enough to make it rather solid, divided into small loaves or rolls, place on a slightly greased tin, and set in a very warm place to rise again. Then wash over the loaves with a little milk, and bake for about 20 minutes. Upon taking from the oven cover with a cloth to prevent the outside from becoming hard. Stale bread, which is far more healthy than new, may be made soft and palatable by covering closely with a tin and placing it for half an hour in a very moderately-heated oven.

Chicory in California.

We are well supplied with drinkables in this country. If one's temperance principles restrain him from our gold medal wines and brandies he still has the choice of milk, buckthorn or chicory. The chicory resources of the State are little known. There have been a good many experiments in growing the roots, but the low market price, coupled with the fact that few know how to prepare the product for the market, has restricted the production. The only chicory factories of which we know in this State are at Stockton and Sacramento. The Stockton Independent has done the commendable service of interviewing the proprietors of the factory near that city, and we take pleasure in producing the facts for the information of our readers: The successful cultivation of chicory depends on having the right kind of soil. It must be a rich, mellow loam, with sufficient clayey texture to make it firm and moist. It should be plowed in the fall to a depth of 12 or 15 inches, and pulverized and rolled with as much care as is usually given to a flower garden. The seed is very fine, like the carrot or lettuce, and is put in in drills about 15 inches apart. Great care must be taken to put it in the proper depth, a half inch of soil over the seed being sufficient. The seed is sown the last of February and through the month of March, if the ground is moist enough. The seed is imported from Germany, it being found impossible to raise it in California successfully, as the plants from California grown seed all run to tops and produce a small, tough, gummy root of no value. The seed, however, is not expensive, costing, delivered here, about 32 cents per pound, and only one and a half to one and three-quarter pounds are required per acre. The roots of the chicory grow about the size of the average carrot, sometimes attaining a weight of four pounds and upwards. The yield is from 10 to 18 tons

per acre if sown at the right time, upon proper soil and with thorough cultivation, but if sown too early the plant grows woody and runs into stalks and stems. The harvest begins about the first of August and runs through the month of September. It is desirable to harvest them when the sun is hot, as the chicory is best when sun dried. The roots are thrown out of the ground with a sub-soil plow, Chinamen following after to cut off the tops and throw the roots in heaps. Sheep, cattle, horses and hogs are very fond of the tops of the chicory and eat them with avidity. As the foliage of the top is very heavy, making several tons to the acre, its value for feed is no inconsiderable amount, although not usually calculated upon at all.

The roots are hauled to the factory or mill, where they are chopped into blocks about an inch square and spread on a board platform in the sun. Here they are exposed four or five days, being turned over every day. At the end of that time they are put into a revolving iron roaster, where they are baked to a crisp of dark brown color. From the roaster they are passed into the grinding mill, after cooling off, and ground to about the fineness of ground coffee. In the process of drying and roasting the chicory loses a little more than two-thirds of its weight, so that ten pounds of roots will make about three pounds of marketable chicory.

The cultivation of chicory, when rightly understood, is very profitable. It costs but about \$5 a ton to raise the roots, including seed, cultivation, digging and hauling, while the prepared chicory is worth from \$125 to \$250 a ton in the market. The net profits per acre is as high as \$300 to \$500, according to the market price. At present the market for chicory is dull on account of an overstock of the foreign article.

It is said that the chicory grown in California is superior to that grown in Germany. In the latter country, about the cities of Magdeburg and Braunschweig, an immense area of country is devoted to chicory alone, millions of dollars being invested in the manufactories. Very little, if any chicory is raised in the United States, outside of California. One of the sources of profit in the manufacture of chicory is the use of the residue or pulp from beet sugar factories to mix with the roots in the roasting pan. A large percentage of this inexpensive article can be put in without deteriorating the general quality. A large amount of unmarketable dust from the grinding mill is also made available by sprinkling it with molasses and water, by a secret process only known by the manufacturers.

AS PREMIUMS.

IMPORTANT NOTICE.

A \$4 Set of Extra Plated
SILVER SPOONS

Given away as a Special Premium to the subscribers of this paper. Silver Goods furnished under this Premium Proposition are from the well known and reliable Union Silver Plating Co., Cincinnati, O.

Under a very favorable proposition from the above well known house, all regular patrons of this paper can secure a useful and beautiful, as well a very valuable Premium, in the shape of a handsome set of Extra Plated Silver Spoons, warranted equal to the best article of the kind sold in this country for \$4 per set. And in addition, each spoon will be handsomely engraved with your monogram initial.

All who are entitled to receive this elegant and useful Premium can do so on compliance with the following conditions:—Send your name and post-office address, together with your express office, to the Union Silver Plating Company, Cincinnati, Ohio, together with the following Premium Coupon, and inclose with your order 75 cts., to pay cost of engraving your initials, express charges, boxing, and packing, and you will receive by return express (or mail, if you have no express office) a full set of extra plated Silver Spoons, free of any charge. All express and packing charges are covered by the 75 cts., and the Spoons will be delivered to you free. If you do not desire to have the spoons engraved, you are only required to send 60 cts., to pay expressage and boxing. The coupon must in all cases be sent, to indicate that you are entitled to this premium, as this very liberal offer is not extended to any one who is not a patron of this paper. The retail price of this set of spoons is \$4.00, as the following letter will show:

OFFICE OF UNION SILVER PLATING CO.,
CINCINNATI, OHIO.

We assure all subscribers that the goods contracted for are first-class in every respect, and that the usual retail price for them is \$4.00 per set. Our lowest price to jobbers is \$36.00 per dozen sets, and we will in no case retail them at any price, or send them in single sets to any one who does not send the required "Coupon," showing that the sender is a patron of this paper.

UNION SILVER PLATING CO.

Premium Silver Spoon Coupon.

PREMIUM

Silverware

Warranted Extra

SILVER PLATE.

To the Union Silver Plating Co., Cincinnati, O.: This is to certify that I am a subscriber of the paper from which I have cut this Coupon, and am entitled, under your premium arrangement, to a full set of extra plated Silver Spoons, with my initials engraved thereon. I inclose herewith 75 cts., to pay express, packing, boxing, and engraving charges.

On receipt of this Coupon, we hereby agree to return to the sender, express or mailing charges prepaid in full, a full set of six of our extra plated Silver Spoons, with the initials of the sender, or any other initials desired, engraved thereon. This Coupon will be honored by us for ninety days from the date of this paper, after which it will be null and void. [Signed]

UNION SILVER PLATING CO., Cincinnati, O.

As soon as the necessary stock can be manufactured, all who secure the above useful and valuable premiums, will be permitted to secure a full set of silver plated knives and forks, on the same liberal basis.

THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at \$6.....	\$12.00
Two firemen at \$4.....	8.00
1,500 lbs of salt at 14c.....	22.50
Wear of shoes and power.....	1.50
Cost for 15 tons.....	\$44.00
Cost for one ton.....	2.93

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,
Reno, Nevada.

The Ingersoll Rock Drill

Is Extensively Used in the East and TAKES THE PLACE OF ALL OTHERS. Wherever introduced, because it can be run with less power, labor and repairs, and do more work than any other drill in the market. It has but few parts, is easily handled, being light, and has AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to

TULLOCH'S AUTOMATIC ORE FEEDER,

Awarded the Centennial Medal.

The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 30 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of the parties certifying to those herewith given, will establish their value and genuineness:

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Sunner mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone \$48 a day. Mr. Green, of the Phoenix mill (12), Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar since started up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Stripe companies, Plumas county, writes: From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage them; the saving in both labor and cost is fully one-half over the old style of feeding by hand. Mr. Preston writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

Of 166 Tehama street, has removed to No. 9 Geary street; office, room 2, fronting on Market, opposite the head of Third street.

ERICH G. GAERTNER,
MINING ENGINEER.

All classes of mining properties reported on, consultations had on reduction of ores of all descriptions, plans for furnaces and reduction works furnished, and the construction of them superintended. Ore tests made at the office.

309 California Street, Rooms 8 and 9.

Continued from page 133.

LADY BRYAN.—Very good work has been done in setting the boilers and completing the brick-work. The connections are about finished and the pumping machinery will be started up shortly.

NEW YORK.—Good progress has been made during the week in raising the third or pump compartment of the shaft, although the rock is very hard.

AMAZON AND GLASGOW.—The north drift on the 300-ft level is still showing a fine character of quartz in the face.

FLORIDA.—Putting in the heavy lift pump at the 400-ft level is progressing finely.

SUCCESS.—The flow of water is light and is easily handled by the pumps.

CITY POINT.—Driving the east drift from the 2000-ft station in the main incline is making good progress. The rock is hard but blasts out well.

BEST & BELCHER.—The east cross-cut on the 1700-ft level is steadily advancing, the face in ledge matter of a favorable character.

SAVAGE.—The broken pump rod has been replaced and the pumps are again steadily at work draining the water from the shaft.

CONSTITUTION.—The pumps are kept going to keep down the water in the shaft, while the repairs to the hoisting machinery are in progress.

BUCKEYE.—The usual quantity of milling ore is being extracted from the stope in the north drift on the 350-ft level.

NORTH CARSON.—Prospecting operations are being pushed ahead as usual at the 500-ft level, with encouraging results.

ARABIA DISTRICT.

SOLD.—*Silver State*, Feb. 26: Deputy Sheriff Burns sold the Montezuma mine, in Arabia district, at public auction in front of the Court house today. The first bid was made by A. H. Elliott, who offered \$10,000 for the property. The next was by M. S. Bonfield, who went \$5,000 better. Elliott saw this and went \$5,000 harder, which brought Gen. Buckner to the front with a bid of \$21,500, at which figures the property was sold by the sheriff.

ELY DISTRICT.

RAYMOND & ELY.—*Pioche Record*, Feb. 17: Work is going on in this mine on the 8th, 10th and 11th levels, with fair prospects of striking ore. The water is 20 feet below the lower station, and is rising slowly. We hope before many days to be able to chronicle the finding of ore, as the indications that way are very favorable.

THE ALPS.—Mr. Theo. Hale, acting Superintendent of the Alps company during A. J. Blair's absence, informs us that an additional force of men has been put on the workings, and the company is now working both day and night shifts. Some very high grade ore is now being shipped to the mill. During the past week the Alps company shipped bullion valued at \$4,007. The Alps mill is running regularly with some 15 different lots of custom ore on the mill dump, and enough ore engaged for a constant run of 60 days. The Condon mill, recently leased by the Alps company, has been thoroughly overhauled and repaired and will commence operations tomorrow. The Alps company has at both of the mills and the mine are now employing 75 men.

JETT DISTRICT.

ENCOURAGING.—*Reese River Reveille*, Feb. 20: Accounts from Jett district are of a very encouraging character. The miners are working with an earnestness, feeling that they have valuable properties. At a meeting of the residents it was decided to name the town site Davenport. The district name remains the same.

PALMYRA DISTRICT.

REVIVING.—*Lyon County Times*, Feb. 24: The mines of this district are again coming into favorable notice. Some capitalists are about erecting hoisting works for the efficient working of some of the many mines known to be rich in gold and carrying a good average of silver. The Palmyra mine, located at the Aurora, is spoken of most favorably, the ledge being wide and well defined, assays from which have gone as high as \$4,000 to the ton. The old town site of Como has been, or is about to be, laid out, Charley Willard having left for Dayton on Tuesday, accompanied by a surveyor, for that purpose. When we have money plenty to work undeveloped mines, Palmyra district will come to the front.

TUSCARORA DISTRICT.

SHUT DOWN.—*Silver State*, Feb. 26: The new mill built by the Grand Prize company in Tuscarora has been shut down. The alleged cause is a derangement of the engine bed; but the real cause is supposed to be a bear movement of the owners.

WARD DISTRICT.

TROUBLE ANTICIPATED.—*Eureka Sentinel*, Feb. 25: On the 23d inst., 14 men working in Matt. Gleason's mine at Ward, were driven off by an armed force of men from the Martin White company. The Gleason men subsequently armed themselves, returned to the mine and drove off the interlopers. Serious trouble is anticipated. Eugene Blair, the messenger of Wells, Fargo & Co., corroborates the above and furnishes us with the following further particulars: The trouble arises over the late suit between the Martin White company and Matt. Gleason. The attacking party were from the Paymaster mine, who, heavily armed, went to Gleason's mine—the Ward Consolidated—and the men at work there not being prepared to resist an armed force, allowed themselves to be driven off. They, however, quickly returned prepared to take possession of the mine at all hazards, and succeeded in doing so, the Paymaster crowd withdrawing at the appearance of a band of determined men, all heavily armed. The Ward Consolidated crowd still hold the ground and keep themselves in readiness for an emergency.

Oregon.

GOOD CLEAN-UP.—*Bedrock Democrat*, Feb. 14: Messrs. Borman & Co., who have been taking out rock at the Virtue mine for about three months past, made a clean-up last Saturday. About 30 tons of rock were crushed. The bullion assayed last Monday and amounted to \$2,054.68. Other companies are now at work at this mine and they feel decidedly encouraged over their prospects.

BOUVIER.—The Sleeper mine, at Connor creek, in this county, was sold at Sheriff's sale last Thursday. It was bought by S. G. Reed & Co., of Portland, who will immediately commence work on the same.

Arizona.

MINING NOTES.—*Arizona Enterprise*, Feb. 19: In Tiger district Riggs and Hammond have their tunnel in on the first south extension of the Tiger about 40 feet and have some very high grade ore. The general impression seems to be that the ore should be roasted or worked by the leaching process. Riggs has four men at work on the Shelton mine in the Basin, and is getting out some very good ore. In Humburg district, Robert Groom and John McDermott are at work upon the Pearl, one of the best mines in the Black Canyon region. Poland, Gavin and Robinson are at work upon a small but very rich vein and have out over four tons of ore that will go over a thousand dollars. On the Tip Top, Moore & Co. have out over 120 tons of ore. Work is being kept up steadily and the mine is improving in appearance all the while. Jack Swilling has some very rich ore in his mine, the Swilling. Humburg district is getting to be a center of attraction and is proving itself to be one of the best mining regions in the country. The great want of the district is a mill for the reduction of ores. At the old Humburg camp, Ed. J. Johnson and others have been extracting some gold rock and have made it pay well, some of the rock working up to as high as \$100 per ton. From Mohave county we learn that work is being steadily carried on upon the Silver Glance, and that the company will start up their furnace at Montezuma next week for its second run. The first run made by the furnace has satisfied the company both as to the fact that the furnace is a good one and that the output is a bonanza. On the McCrackin 150 tons of ore per day are being taken down in the mine. The mill is running to its full capacity and is turning out an average of

\$1,500 in bullion per day. Mr. McCrackin has gone to California. The latest proposition with regard to the mine is to build a railroad from the mine towards Fisher's springs, four miles from Greenwood. There the company proposes to put up a 40-stamp mill. In Cedar district, Bob Orr and the Kimball brothers are working upon the Arnold, and are getting out some ore that goes about \$500, and reports are working around the resumption of the French and Hackberry Clark are working on the first north extension of the Magendie mine. They are sinking a shaft which is to go down 100 feet. They have some \$300 ore, carrying some gold, and their mine bids fair to equal in richness the original location.

Idaho.

OWYHEE MINES.—*Idaho Advocate*, Feb. 24: Operations at the Golden Chariot are progressing very favorably. There is every indication that the vein at the 13th level will prove unusually rich. The ground is quite soft and presents a varying appearance as the work progresses. The drift is in 164 feet, and as the cross-course is approached the pay streak improves in quality and no doubt is now entertained of the existence of a rich ore body in the immediate vicinity. The cross drift from the 9th is now in 50 feet with good ore all the way through. Considerable rich rock has been taken out during the past few days from the 5th and 6th levels, and there are several hundred tons of ore at the mine awaiting shipment to the mill. Those who are expecting rich developments in the Chariot will not be disappointed. The workmen at this mine were paid off on the 20th instant, the amount expended for this purpose being nearly \$10,000. The Belle Peck is looking well as usual. The workmen continue sinking the shaft and the yield of rich ore promises to be more abundant than ever. Developments continue to be quite satisfactory also, at the Potomac. The prospects of the Empire mine are brightening. We learn that there is to be a reorganization of the old company, and that active operations will be carried on the coming season. Since it has been ascertained beyond question that the Empire embodies a magnificent bonanza, the old owners of the mine have woken up to the necessity of prompt action. Recent reports relative to the resumption of work in the Potomac are very favorable. Judicious work and good management will demonstrate the fact that there is not a better mine on the Pacific Coast.

Montana.

DAVIS MILL.—*Butte Miner*, Feb. 13: Nearly \$7,000 in crude bullion was shipped from A. J. Davis's mill today to the Government assay office at Helena, and another shipment will be made during the week. The pans in use will test a little quicker, which has been the greatest defect in the works since starting up, but this trouble will soon be overcome. The process now used in the reduction of ores was questioned by many before the starting of these works, but a trial of three weeks has demonstrated the fact that it is all and even more than has ever been claimed for it, as silver to over 70% has been saved, and also a large percentage of gold—something that was unexpected. Notwithstanding the fact that the mill, with a knowledge of the above facts, we pronounce the mill a decided success, not only in the treatment of the ore but also in a financial point of view, as it is paying a handsome profit upon the cost of mining and milling, although running on second-class ore.

CRUDE BULLION.—The amount of \$2,500 was shipped today from the Centennial mill to the U. S. assay office at Helena. Shipments from the mill can now be looked for regularly.

FIVE BARS OF SILVER.—Representing a coin value of \$5,400, were shipped from the Dexter mill on Friday last. The mill is still running on ore from the La Plata mine, the average assay of which so far has been 183 ounces silver and \$66 gold.

THE YOUNG & ROUBIDUSH MILL was in operation for five days and two nights last week. The mill is still incompleting, but is now running and not making any loss. During the time it was in operation it was demonstrated that five tons of ore can readily be crushed per day.

TIZ LITTLE ARABIA at the head of Yankee Doodle gulch has been successfully working since the accident some weeks ago, though the amount of ore crushed has only been about one-half its capacity, owing to the present low stage of water. But the percentage of bullion saved has been higher than was at first believed to have been possible. Upon a lot run last week 91% of the assay value of the silver in the ore was taken out.

Utah.

STOCKTON MINES.—*Cor. Salt Lake Tribune*, Feb. 23: Our mines are looking better than they have ever looked, and much ore is being shipped to the Chicago and Waterman smelters, the latter of which has been buying ore outside for some time past. First in rank of our mines is the Silver King No. 2, west extension, owned by L. D. Davis and superintended by Thos. McCarthy. They have a shaft sunk 500 feet and levels east and west on the vein 100 feet below a continuous and immense body of ore. The track is being straightened and repaired, preparatory to furnishing the Chicago smelter with all the fluxing ore it requires. This is a valuable property. The Muscatine, Quandary and Iroquois, worked mostly by J. P. Ostrom; the Rustler and A. W. Atkins and Old Business come next, producing from 80 to 100 tons of ore monthly, which is purchased by the Chicago smelter. These mines for a long time have had, but through the energy of the parties named have been made profitable. The Legal Tender is being worked by Sampson & Stevenson, who are about to erect a whim, which will enable them to ship 50 to 75 tons of ore monthly. Many strangers are amongst us, who have succeeded in getting leases on reasonable terms, and appear satisfied that they have good wages. The prospects of this place are bright, and although we were sorely shaken and badly rattled by the failures of last fall, we are satisfied with the lesson learned and feel cheerful and happy.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco.

DONALD G. & S. M. Co.—Feb. 26th. Location, Nevada. Capital stock, \$10,000,000. Directors—C. B. Jellison, F. H. Farley, Daniel Kaplan, D. H. Percy and John Ward.

FLORA M. Co.—Feb. 26th. Location, Utah territory. Capital stock, \$2,000,000. Directors—F. McDermott, David Porter, Thos. R. Hayes, E. P. Connor and Henry Toomy.

FARREL M. Co.—Feb. 26th. Location, Amador county. Capital stock, \$10,000,000. Directors—Thos. Burke, A. Wason, Wm. O'Connell, W. F. Burke and Geo. W. Hayes.

SILVER GLANCE M. Co.—Feb. 26th. Location, Arizona. Capital stock, \$5,000,000. Directors—E. M. Walker, J. P. Rankin, D. B. Gillett, Jr., B. W. Mudge and Daniel Buck.

CALIFORNIA WIRE WORKS Co.—Feb. 26th. Object, the manufacture and sale of wire goods. Directors—A. S. Halliday, W. R. Morse, James G. Dewitt, J. P. Bering and H. T. Graves. Capital, \$100,000.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from prominent mines have been as follows: Northern Belle, February 20th, \$10,824.96; Comanche, 20th, \$3,614.25; Northern Belle, 18th, \$17,026.50; California, 20th, \$150,285.86—total to date, \$669,635.85; Modoc, 20th, \$5,570; Manhattan, 22d, \$11,000; Con. Virginia, 20th, \$24,237.29—total to date, \$191,314.08; Leopard, 27th, \$5,300; Manhattan, 24th, \$10,200—total to date, \$33,900; Modoc, 20th, \$10,240—total to date for February, \$41,000; Northern Belle, 25th, \$15,900; California, 24th, \$166,416—total so far on February account, \$1,045,408.

PATENTS AND INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING FEBRUARY 20TH, 1877.

TIP-CUPS FOR UMBRELLAS.—Lewis Cutting, S. F. **METAL WHEELBARROWS.**—Calvin Nutting and Calvin Nutting, Jr., S. F.

REFLECTORS.—Emil Boesch, S. F.

CHURNS.—Rebecca Sara Brusio, Sonora, Cal.

UMBRELLA RUNNERS.—Adam Good, S. F.

SLOP-HOPPERS.—Miles M. Harvey, S. F.

SPEED AND DISTANCE INDICATORS.—Gustavus M. Jensen, Portland, Ogn.

MANUFACTURE OF TEA-KETTLES, ETC.—Azarad J. Lowell, Alvarado, Cal.

SPRING MATTRESSES.—Alexander C. McMains, S. F.

QUARTZ MILLS.—Allen Oliver, Forest Hill, Cal.

METHOD OF CONNECTING LUMBER FOR TRANSPORTATION IN FLUMES, ETC.—William H. Thurman, Borden, Cal.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

TEA-KETTLES.—A. J. Lowell, Alvarado. This invention relates to certain improvements in tea-kettles, some of which improvements are also useful in the manufacture of other articles of tinware. The top of the tea-kettle is made perfectly flat, and instead of making the opening through which the kettle is filled in the center of the top, it is made at one side of the center, so that the flat top is braced on its under side to give it strength. These braces are made of tin by first forming a strip or piece of tin into a square tube and then soldering it to the under side of the top. The cover or lid is made with a depression in the center, across which is a wire. By making the top flat it can be used for setting dishes of cooked victuals upon in order to keep them warm. Two handles are provided which can be separated and turned down. A detachable shelf is arranged to be attached to one side of the kettle on a plane with its top. One edge of this shelf is supported on the edge of the top, while its opposite edge is supported by an angular brace. This platform is also useful for supporting any article which it is desired to keep warm. This inventor has also devised a protection for the inside angle which is formed by the junction of the sides and bottoms of tin vessels, where they are most liable to rust, and a protecting base or continuous foot for them to rest upon, the object of which is to prevent the bottoms from wearing through by friction. Tin tea-kettles are worn out soonest at the corner of the bottom, directly below the spout, owing to their being frequently tipped forward. To protect this point a patch is placed over this edge to receive the wear. These improvements enable the inventor to produce a superior tea-kettle or article of tinware.

SLOP-HOPPER.—Miles M. Harvey, S. F. This invention relates to an improved slop-hopper and stench trap for outside drains, and it consists, first, in constructing the hopper with a bell-shaped attachment to its bottom, which not only forms a part of the trap but serves also as a foot or base for the hopper to stand upon when it is lifted off of the trap; secondly, in a simple manner of connecting the hopper with the trap, and, thirdly, in an improved trap. This device is very simple and can be cheaply constructed. The hopper can be readily removed to be cleaned out and as readily replaced, while the trap arrangement is self-cleaning and forms a perfect water-valve, which will prevent any gases which may be generated in the drain or sewer from being discharged through the hopper into the open air.

REFLECTOR.—Emil Boesch, S. F. This invention relates to improvements in that class of reflectors on which silvered glass is used for a reflecting surface. The improvements relate to the manner of constructing the frame and mounting the glass sections therein. The method patented protects the silvering of the glass from damage and it does not sweat and spoil. The invention provides a strong durable glass surface reflector, which is protected from damage and which is also light and ornamental.

UMBRELLA RUNNER.—Adam Good, S. F. The patent covers an improved runner for umbrella handles, and the invention consists in a novel arrangement for connecting the ends of the wire braces which spread and strain the ribs of the umbrella when it is open, with the upper end of the runner, so that they can be easily attached to or detached from it when desired. This runner will be both convenient and ornamental, and by its use the owner of an umbrella can easily relax the parts by releasing the brace wires, so that any part of the umbrella can be readily repaired.

Farmers vs. Miners.

EDITORS PRESS:—In a late issue of the PRESS appeared a letter from Mr. George Ohleyer, criticising an article published by you not long since in regard to the differences that have grown up between the farmers and the miners. In view of the opinion expressed by Judge Sexton in the case of Atkinson vs. the Sacramento and Amador canal company, recently tried before him, it is hardly worth while to discuss the legal questions involved in this controversy, as that opinion concedes to the miners about all that they claim in the premises, and if sustained in the higher courts will effectively dispose of the entire matter. There are, however, one or two other points in Mr. Ohleyer's letter that it may be well to notice. He states, for instance, that the injury complained of first manifested itself in a decided way in the year 1862; and in this he is right, for although great quantities of this mining debris had before this been run off, the most of it had lodged in the beds of the ravines and rivers in the foothills, and there remained until the floods of that year brought it down and deposited it upon the alluvial bottom lands below.

As early, then, as 1862, these farmers were made fully aware of the danger to which they would be exposed were this business of hydraulic mining suffered to go on unimpeded, and yet not until within the past year did they institute legal proceedings against the miners or otherwise signify their intention to interfere with the further prosecution of this industry.

Now, in 1862 hydraulic mining, in so far as the investment of money is concerned, was still in its infancy, few of the present expensive works designed for its furtherance having as yet been constructed. Then the extensive ditches, reservoirs, bedrock tunnels and other costly auxiliaries to the business, now everywhere seen, had no existence, and that was the time for these parties to have appealed to the courts for protection, or in some other way publicly protested against this continued invasion of their rights if they ever intended to do so. For fifteen years they have suffered poor, hard-working men to spend their time in acquiring and opening up this class of properties and capitalists to invest millions upon millions in providing the improvements necessary for operating them, and yet taken no concerted action calculated to question the right of the miners to dispose of this debris in the manner they had been accustomed to do; having, in fact, by their silence and inaction virtually conceded the right of the miners to so continue this custom. The farmers knew that the miners claimed under their local regulations the privilege of running their tailings into the adjacent streams—knew that the courts recognized the validity of these regulations, and that Congress had declared by law that they should have all the force of statutory enactments; and yet they failed to oppose or at least took no effective measures to defeat them. That it is too late now to seek to reverse these laws and long-established usages by recourse to litigation will be made apparent when they come into the courts. As suitors the farmers will find that equity and fairness are against them, wherefore they had better accept the invitation so often extended to them by the miners and co-operate with the latter in securing such legislation as will be best calculated to afford them relief.

Your correspondent thinks it would be practicable to conduct the mining debris upon the tule marshes, and thus reclaim them, while diverting it from the bottom lands along the rivers, were it not that these marshes are required to receive the surplus water on the occurrence of floods, which would otherwise inundate the great inland valleys. The answer to this objection, if it really has any force whatever, is that it would require from fifty to a hundred years to fill up these swamps in the manner proposed, a period so remote that we shall probably be able to find means for obviating this dreaded evil, through the extensive storage of water in the mountains and otherwise, long before it arrives. The conducting of these tailings upon the tule swamps is entirely feasible, and there they will have to be carried unless it shall be concluded to let them go on lodging upon the alluvial bottoms and filling up the rivers as heretofore, inasmuch as any attempt to put a stop to hydraulic operations is almost sure to fail. For reclaiming large portions of vast and low-lying swamps this waste material from the mines would be of incalculable value, since without filling them up in some such manner they can never be worth much for agricultural purposes.

H. D.

EUREKA VS. RICHMOND.—Dispatches from Eureka say that the Eureka Consolidated mining company has again commenced suit against the Richmond company by an application for injunction. Judge Cole issued a restraining order returnable March 17th. The London corporation of the Richmond company having been declared by the Court not to be the proper defendant, the counsel for plaintiff has made the Richmond company of Nevada, Thomas Wren its President, Joseph Potts, foreman, and 100 others, defendants in the action. The amount sought to be recovered is not mentioned in the complaint. The papers were served on the 24th ult. and work was stopped in the celebrated Potts chamber of the Richmond mine. It will not interfere with the workings of the other portions of the mine, and the five furnaces will continue in operation.

Mechanical Ore Concentration and Separation—No. 24.

[Written for the Press by FRANCIS M. F. CAZIN, M. E., Santa Fe, New Mexico.]

I have thus designated all that should be gathered for treatment in the shape of slimes in all mineral dressing establishments, and this collection should invariably be effected, whether further mechanical separation or direct reduction be subsequently applied. It is here befitting to describe the mode of collecting slimes out of water. They may be collected and passed into further treatment as pulp, or the pulp may be allowed to dry, as it readily does in dry climates within a very short space of time, without the help of fire and heat.

In case of a direct reduction by roasting, etc., the dry and solid pulp requires a squeezing, effected best by rollers, (even hard wooden ones are adaptable,) in order to recover the state of powder or dust.

Introductory to the description of the collecting apparatus, I must draw the reader's attention to a material modification of action, the result of practice, which takes place in treating slimes, from what is invariably maintained in treating the coarser sizes. Coarser sizes, without any exception whatever, are first thoroughly classified by size and then separated by quality. For finer sizes (slimes) this course would be also correct if it were feasible to the same full extent; but screens will not classify below a certain size, say one-third of a millimeter, and therefore other means of classification must be resorted to. These means are the exposure of the particles to the effect of a horizontal water stream.

Such streams can be made to classify material of equal specific gravity to perfection. Thus quartz particles so classified may be collected in lots of perfectly equal sizes, but if amongst the particles of quartz there are heavier particles, for instance of galena, then smaller particles of galena will be gathered with larger particles of quartz (one-eighth inch particle of galena will gather with one-twentieth inch particle of quartz, and other sizes in the same proportion). Such particles of different material, which will simultaneously fall or be kept in suspension or be deposited in an upward vertical stream of water, are called "equal falling," and the action being certainly in part, and evidently the predominant part, that of classification, is considered in practice as such. Thus the difference is constituted between

1. Classification by screens, and
 2. Classification by streams of liquid (or air).
- The collecting apparatus now to be described is also and at the same time a classifier of the second class. The subsequent action of separation varies according to the previous mode of classification.

In Number 10 of this series, alluded to before, we have stated the principles on which separation is based when classification of the first mode is applied, and hereafter we also will find the proper place to state the mode of operation for separating material classified by the second mode.

General News Items.

DR. TEMPLE, pioneer of homeopathy, and founder of the Homeopathic College, Missouri, died last week, aged 70.

A MADRID special announces that the Spanish Minister of Foreign Affairs is engaged upon a draft of a treaty of commerce with the United States.

HESTER, Tully and McHugh, the Molly Maguires on trial at Bloomsburg for the murder of Alexander Ray, near Centralia, Penn., have been found guilty.

The printers of San Francisco are making arrangements for a picnic to be given at Damon's Grove, Sausalito, on April 15th, in aid of the cemetery fund.

SECRETARY ROBESON says if the proposed reduction is made in the appropriation for the pay of officers and men of the Navy serving abroad, the ships and crews will have to be brought home at once.

The probability is that Rear-Admiral John Rodgers, now in command of Mare Island Navy Yard, will be ordered to the command of the Naval Observatory at Washington, in place of Rear-Admiral Davis, deceased.

SALINAS CITY, Monterey county, has a sensation; a defalcation of \$20,000 having been discovered in a county official's office. The court house was burned a short time since, and it is believed that the records were burned to destroy proof of the defalcation.

PETITIONS are being circulated throughout this city calling upon the Board of Supervisors to raise the license fee of liquor saloons, in the belief that the low dens and dives which abound in certain districts will thereby be compelled to give up business.

A BELGRADE dispatch says: All day Saturday and Sunday wagon trains have been transporting a large quantity of small and large ammunition from the fortress of Belgrade to the quay, to be taken down the Danube this morning. This movement contrasts with the peaceful news from Constantinople.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served by the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisements in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch.
J. H. WEED, V. KINGWELL.

PICKERING ENGINE GOVERNOR.

VALLEJO FOUNDRY, October 17th, 1876.
Messrs. NEYLAN & YOUNG, San Francisco,
Agents for "PICKERING GOVERNORS."

Gents:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this year for my patent Straw Burning Threshing Engines give splendid satisfaction. They far surpass for regularity of speed any Governor that I have ever seen, and I have seen all the best kinds; I have seen the main belt fly off the pulley several times this season while threshing, and the engine did not discover it, so perfectly was the speed maintained, until he was told of it; this I consider something wonderful; I consider the Governor absolutely perfect, so far as speed is concerned. I bought and put on to one of my engines a Shive Governor, to see which was the best, and after one season's trial I have no hesitation in saying they are superior to any other Governor that I have seen or used. I wish you would send me the lowest price that you can furnish 25 Governors for next season's engines.
Yours respectfully,
J. L. HEALD.

The only Governor that has received awards at each of the International Exhibitions. American Institute Fair, New York, 1865, Two Medals; Mechanics' Institute Fair, Baltimore, 1865, Silver Medal; American Institute Fair, New York, 1869, Two Medals; International Exposition, Paris, 1867, One Bronze and Two Special Medals; International Exposition, Vienna, 1873, Medal of Progress and Decoration; International Exhibition, Philadelphia, 1876, Medal and Diploma.

Over 8,500 in Successful Use in the United States.

\$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

REFERENCES.

A letter received from the Julian Mill, Newcastle, says of the Carrier Feeder: "It is the most perfect Feeder we have ever seen; don't see how any mill can do without them." A letter from Mr. C. C. Belding, of Amador County, speaks in the highest terms of them. Two of the machines were shipped to the Bunker Hill Mill, also Gover Mill, Amador County. Mr. Stevenson, of Boston Mill, Gold Hill, Nevada, says they are the best Feeder he has ever seen. Soulsby Mill, Tuolumne County. California Company, Nevada City. Omaha Gold Mining Company, Grass Valley. St. Patrick Mill, Placer County.

\$1,000 CHALLENGE.

Backward in Coming Forward.

C. P. Stanford Fails to Come to Time on the Challenge of \$1,000 to Test the Merits of His Ore Feeder as Against Mine. The Challenge is Still Open to Him or any one else. GENTLEMEN, Put up or Shut up.

A letter has been received from the Crescent mine, Plumas County, in which it states that the Tulloch is a failure as against the \$1,000 Challenge Feeder of Hendy's.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

59 Nevada Block, S. F.

THE ASBESTOS PATENT FIBER COMPANY,

TWO MEDALS OF HONOR

TWO CERTIFICATES OF THE HIGHEST MERIT

Of Philadelphia, offer for sale through their agent in San Francisco,

Asbestos Steam Packing, Asbestos Boards and Asbestos Steam Joints,

All manufactured from the pure utilized Asbestos Patent Fiber, and under patents granted to J. S. Rosenthal. The packing is in all sizes from one-quarter to three inches in diameter, round, and free from all grit or mineral matter. The non-utilized or crude Asbestos, manufactured by some parties into packing, is impure and gritty, liable to injure the piston rod and should not be used. The packing made under the Rosenthal patents is of pure utilized Asbestos fiber, and a very superior article and entirely different from the so-called Asbestos packing heretofore offered for sale. It is compact in form, will not fuzz or disintegrate, and will wear much longer than any other kind of packing. The indestructible, expanding, contracting and lubricating qualities of Asbestos are now universally recognized, and packing made from it is peculiarly adapted for steam engines and pumps.

ASBESTOS PATENT FIBER BOARD.

This is the champion non-conductor, to prevent radiation of heat and condensation of steam, as covering for marine, stationary, or locomotive boilers and pipes, and for lining wood-work, where exposed to great heat. It is light, flexible, is not disturbed by vibration, and will not char or crumble. The sheets are 30 by 44 inches, of any desired thickness, and are easily applied.

ASBESTOS PATENT FIBER STEAM JOINTS.

Indestructible by fire or water, expands and contracts in a desirable manner, adjusts itself to any rough point, is cheaper than rubber, and in all respects a superior article. PURE ASBESTOS FIBER for packing steam governors and other purposes. All these goods are extensively used in the Atlantic States and give general satisfaction.

Also, For Sale by

DUNHAM, CARRIGAN & CO.,

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Kroehne's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

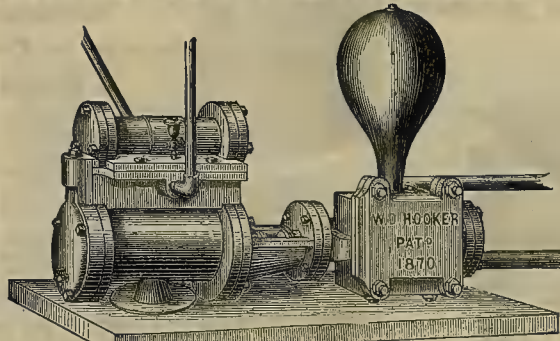

In speaking of amalgamators, the author describes a cheap amalgamator, grinding the directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel, trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome Street, San Francisco.

THANKS, ETC.—Messrs. Dewey & Co., Gents: I write to acknowledge the receipt of letters patent on my fruit drier, which came to hand to-day. Accept my thanks for the very satisfactory and successful manner in which the case has been handled. Respectfully yours,
HILAND G. HULBURD.

Scientific and Practical Books Mining and Scientific Press.

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents. As an

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

Mechanical Ore Concentration and Separation—No 25.

(Written for the Press by FRANCIS M. F. CAZIN, M. E.,
Santa Fe, New Mexico.)

Funnel Box (Spitzkasten.)

The best apparatus adapted to collecting slimes from water is called *spitzkasten*, and may be designated as "funnel box," because it is a row of square funnels, diminishing in size and depth. The principle on which the funnel box is constructed is as follows: In a horizontal stream of water of sufficient depth but of diminishing velocity (widening out in space for the same quantity of water), of one kind of material the coarser particles will sink first and those next in size will sink next, the finest particles sinking last. A study of our river and creek valleys will illustrate this law very impressively. Boulders, gravel, sand and clay have been deposited by this rule and continue to be wherever water is flowing. Water the velocity of which is sufficiently equalized and diminished will deposit the very smallest and finest particles of solid and heavier material after the particles of greater size have been deposited before.

The importance of this apparatus to all who work ores, jointly with the fact that lumber and skilled carpenter work is all that is required to make it, induce us to give working drafts of the most effective and most easily made variety.

The funnel box represented in the diagram (on a scale of one-quarter inch to the foot,) rests on eight frames (St. Andrew's crosses), each frame having a special sill and plate. All eight frames rest on four sleepers. The intersecting point is higher in each frame than in the previous one. They are arranged on the sleepers so as to bring the cross-points into one (inclined) line, and the insides of the top angles are then boarded up with tongued and grooved lumber of the thickness of one and one-half to two inches, the boards running parallel with the inclined bottom line; the boarding is then cut alongside the outside frames. Sides and bottom are then put in between strips in the zigzag shape shown by the draft. Thus three funnels are formed, with a hole, *c*, near the bottom of each, through one of the sides, with a syringe to shut them. The gutters, *d*, receive the pulp, and the boxes, *e*, either conduct it to concentrators, of which we shall speak hereafter, or reserve it for the purpose of becoming dry. The inlet, *a*, is for the muddy water carrying the slimes, and *b* is the outlet for the clean water.

In case the water escapes from this apparatus still muddy, it would be of little benefit to conduct this escaping water to another apparatus of the same description, but the water flowing into the apparatus should be diminished, or part of it should be conducted to another apparatus of the same description, because in order to deposit the finest particles the velocity of the water should not exceed a certain limit, which by repetition with the same amount of water cannot be attained but by a diminution of quantity.

Although this apparatus is intended, first, to collect the finest sands and slimes, it answers to the other purpose of imperfect classification, as heretofore explained. As sizing (classification) is required in order to prepare the proper conditions for separating grains and sands by their difference in specific gravity, so the separation according to quality of slimes requires the preparatory act of assorting according to sizes (classification), and this requirement is as much more preeminent with slimes than with grains and sands, as the difference in sizes is greater among the finer classes than among the coarser ones, as they vary from one-half millimeter down to microscopical sizes. The apparatus here described acts, as stated before, as a classifier also, and with such perfection that the much complicated Wengler classifier for slimes alone has no preference, but it will work coarse and fine sands in a greater quantity, and if serving for the classification of sands will by necessity have to be supplied by the addition of

simple funnel boxes for collecting and assorting the slimes.

Though the funnel box acts as a classifier, and as such acts with perfection, one exception must be again mentioned, and this is that the classification is perfect only for one and the same material, but that finer particles of heavier material (metallic ore parts) will sink and gather simultaneously with the coarser particles of lighter material. As a simple consequence thereof, the material once classified by funnel boxes would be separated by the simple action of another classification by screens, but this method has practically proved applicable to sands only and to the coarsest of slimes, but as impracticable for all sizes below one-third millimeter (one-seventy-fifth of an inch). Nevertheless, it is exactly on the assortment thus obtained of larger and lighter particles of one material and smaller and heavier particles of another material, that almost all successful appa-

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective superintendents on file at the offices in this city. Considerable of this news is later than that procured from the interior journals:

Good progress has been made in cleaning out the cave in the incline of the Hale & Norcross, and they expect soon to remove this obstruction and be able to lower the pump and free the mine of water.

The Superintendent of the Gila says: The vein as far as prospected, 70½ feet in the winze and 26½ feet in the drift, has been very regular, and I think its permanency cannot be questioned; it carries in both places a little good ore and looks very encouraging.

The developments made in the Eureka Con-

PLAN OF FUNNEL BOX.

rat for concentrating slimes are to work, and it may be fairly asserted that none of them will work to full satisfaction unless the material fed to them be collected and assorted in the before-described method, or unless a more perfect classification, even, has been applied. It is thus evident why screen assorting is applied for jig-

solidated are looking well and still show signs of improvement in the extent of ore deposits. etc.; 10th level, face of drift in ore and looking well, with very encouraging prospects of developing a larger body of ore. The furnaces are running well and yielding an increased product of bullion.

FUNNEL BOX FOR COLLECTING FINE ORE-SANDS AND SLIMES.

ging and funnel box assorting for all machinery separating slimes.

BULLION SHIPMENTS.—Since our last issue have been as follows: Leopard, Feb. 26th, \$5,359.99; Hussey, Feb. 26th, \$1,600; Northern Belle, Feb. 25th, \$15,979.70; Con. Virginia, March 1st,

V.), March 3d, \$17,500; Tybo Con., Feb. 28th, \$9,836.60—total to date, \$64,297.75.

Mining Accidents.

Quite a chapter of accidents in mines are recorded this week, occurring in different parts of the coast. Several of the accidents were fatal.

On the 2d inst., as the men were about descending to work in the Rising Sun mine, Colfax, Placer county, John Eddy stepped into the tub, when the wire rope parted and he was precipitated to the 500-foot level. His remains, when found, were a shapeless mass. Several men, who were at the bottom of the shaft, narrowly escaped death from the falling bucket.

On the 3d inst., Scott Ward, a young man employed in the Brush Creek quartz mine at the Mountain house, while oiling the machinery, was accidentally caught by the fly wheel and killed. His body was cut in two and his left arm torn out.

By the accidental caving of a lot of rock in the header of the Suro tunnel, on the 6th inst., a miner was almost killed.

Last Saturday while Sol. Rogers was at work with his partners in the face of the drifts, on the 815-foot level of the Florida mine, on the Comstock, a cave occurred by which Rogers was quite severely bruised and cut. He was severely injured on the right side, where a piece of rock made an indentation which apparently extended to the cavity within the short ribs, appearing to be broken. He was also badly bruised about the left side and in other places.

Thomas Wilson, a miner in the Imperial, on the Comstock, was killed on the 2d inst. He was working in a hot place, and came up to the station to cool off, when he was killed. Deceased was a native of Scotland, 38 years old. Muldoon, a man working with Wilson, and who came up the incline with him, says he saw Wilson try to climb up on the station, and also saw him when he fell back. When the man fell, Muldoon started to his assistance, but before he could be reached he had partly risen, and in trying to gain his feet he fell over the next set of timbers. In this way he continued to struggle and fall until he had gone down between thirty and forty feet. At one time Muldoon got hold of him, but his body was covered with perspiration, and it was impossible to retain the grasp upon him. As is usual with miners working in hot places, Wilson was stripped to the waist. Finally Muldoon managed to get below the man, and putting his knees on the timbers stopped his further progress downward. Wilson then clutched the guide of the giraffe and held on with the grasp of a man who is struggling for his life. It was with difficulty that he was gotten loose from the guide. Muldoon says Wilson did not faint but fell back from mere weakness, and was unable to regain his feet. The declivity of the decline is not very great, and Wilson was not hurt by his descent. He had simply remained in the heated atmosphere longer than he was able to endure. There were three new men on the shift, but all who were accustomed to the heat got out all right. Thomas Oliver, who came up with Wilson, was a new hand in the mine, and was working his first shift. Wilson was in a semi-conscious state for nearly an hour after the time when he fell, but was unable to explain his sufferings intelligently. The jury returned their verdict in accordance with the facts, and exonerated the company from all blame.

THE PROSPECTS IN IDAHO.—"A. B. R." writes us from Boise City, Idaho, as follows: Our winter is far advanced and as yet we have had but little snow, and grave apprehensions are entertained relative to the prospects of our placer mines in the surrounding camps for the next season. It is true, however, that there were heavy rains during the preceding fall and early winter, which made the ground quite wet and may help out the light fall of snow. We hope that March and April will make up the lost time in quantity of snowfall. The ground in the valleys being well saturated by the fall rains, we have hopes for good crops. There has not been to exceed two inches of snow at any time this winter in the valleys. Stock of all kinds are rolling fat. The thermometer has not at any time this winter been below 7° above zero. There were only two days this winter when the sun did not shine clear and warm.

The Empire mine, Grass Valley, cleaned up \$20,000 from a 24 days' run last week.

The water in the Succor shaft is getting less every day.

The letter of the 4th from the Con. Virginia says: The west drift on the 1650-foot level, from the C. & C. shaft, was connected with the drift from the California deep winze on Tuesday of last week. Since that time have been enlarging and retimbering some 150 feet and repairing the track and putting in switches so as to run north; also south to connect with the Con. Virginia deep winze. This work will be completed in some eight or ten days. We shall then commence breasting out ore. This drift is now cool and pleasant, as the ventilation is perfect.

At the Frost shaft of the Manhattan the foundation pits for the engine are completed and the work of laying the foundation completed.

The Superintendent of Best & Belcher finds it necessary to put in larger air pipes. Up to this time they have relied solely on the Gould & Curry for air, and by putting in 15-inch pipes they can do more work and have a better supply of air.

In the California they have connected the south drift on the 1600 and the drift from the deep winze on the 1650-foot level with the drift from the C. & C. 1550-foot level, and have secured excellent ventilation.

The Chollar turned out 679 tons of ore last week valued at \$25 per ton.

In the North Con. Virginia they are using Burleigh drills in the bottom of the shaft and are making good progress in sinking.

They have now control of the water in the Comanche main shaft, and the work of sinking is going on again.

The Grand Prize new mill is working 20 tons of ore per day.

CORRESPONDENCE.

Mines, Sampling Mills and Smelting Works Around Salt Lake City.

[From our Traveling Correspondent.]

So much has been written and so well in regard to the beauty and wonders of this great inland city, that little is left to be added. It numbers at present about 25,000 inhabitants. It is apparently as quiet and orderly as Indianapolis, the so-called "city of churches," besides bearing a striking resemblance to it in some other respects. What has been said of its rising temple, its tabernacle of mammoth proportions, its theater, hotels, public buildings, broad and well laid out streets, lined with shade trees—the side-walks everywhere bordered with streams of pure mountain water—and its wide blocks planted in fruit trees at short intervals throughout the whole extent of the city, need not be repeated. What is of the most interest to the miner or mechanic, is to know that he can obtain the necessary machinery and facilities for his operations at cheap rates and without delay.

In addition to the extensive works of the railroad companies, there are at least two large foundries, with boiler and machine shops attached, not to mention other establishments, confined to particular branches of the business. The Salt Lake Iron Works, T. Pierpont, Manager, situated near the Utah Central depot, seem well prepared for a large business in manufacturing and repairing engines, boilers and every variety of mining, milling and hoisting machinery. A good substantial building has also been erected in the city for dry concentration after the Krom process, but the works are not yet in running order; and besides several furnaces at convenient distance, the Pascoe smelting works are located near the somewhat celebrated Warm springs, within the city limits. They have been running regularly and successfully, producing last year 190 car-loads of base bullion, valued at \$380,000. Several novel and ingenious appliances were seen here, among them a partially constructed concentrator, the invention of Mr. Pascoe, with some new and promising features in the way of wet concentration, the details of which he prefers withholding from the public until after its completion, when they can be made much clearer by wood-cut illustration.

Some of the Mines of Little Cottonwood.

Alta City is in the very heart of the mines, 28 miles from Salt Lake by rail. It is situated in a deep gorge, 8,000 feet above sea-level, surrounded by lofty mountains covered with snow, and not without danger from snow-slides; but such is the richness of the surrounding mines that it is populated by many hundreds of brave men and women, not a few who dare spend years where your correspondent was not particularly anxious to prolong his stay.

The Lavinia Mine,

Situated near the head of Little Cottonwood, and the property of Salisbury Bros., is worked by a tunnel 1,800 feet in length. The ore is found in chambers from eight to ten feet wide, (occasionally from 15 to 20 feet). The amount extracted per month is governed somewhat by the season, and varies from 300 to 1,000 tons, averaging \$45 silver and running from 45% to 50% lead. It is represented as one of the paying mines in the district, and gives employment to a large number of men.

The Utah Mine,

500 feet south of the Lavinia, and the property of Mr. M. T. Gisborn, of Salt Lake, is under the superintendence of Mr. A. J. Phillips, and is also on a good paying basis. Tunnel 300 feet on the vein; winze No. 1, 150 feet from its mouth, 90 feet deep; winze No. 2, 200 feet from mouth of tunnel, is 125 feet.

The main incline is now being sunk 350 feet westerly from the mouth of tunnel, and at present 80 feet on the vein, from which point a level is being run that will reach a depth from surface of 315 feet. It has a vein of at least two feet of good pay ore, carrying 45 ounces of silver, 30% lead and about 20% of oxide of iron, making it a very desirable smelting ore.

The Celebrated Emma Mine,

About which there has been so much litigation, lies but a few hundred yards above Alta, on the north side of the canyon, and is in charge of Mr. J. Scrimgeour. Everything is in first-class order and events are believed to be shaping themselves in such a way as soon to lead to the resumption of work.

The Equitable Tunnel & M. Co.'s

Works are located next west and near the Emma. Office in San Francisco. Resident Superintendent, Mr. J. P. Courter. The work, both mining and mechanical, is done in the most economical, substantial and workmanlike manner, and everything about the mine and works wears an air of neatness and discipline. Their principal work is a main tunnel, 1,500 feet in length, located 100 feet lower on the mountain side than the Emma works, while the exploration

of discoveries already made is carried forward simultaneously with the further extension of the main enterprise.

The ore at present being extracted, although not in large quantities, is looking remarkably well, and owing to the fact that it contains a large percentage of iron it makes it of a character much sought after by the smelters. Some small lots had some time previously been shipped as tests, that ran as high as 75% in lead and 80 ounces in silver.

The Phenix Tunnel,

J. P. Courter, Superintendent, is located in a gulch just east of the Emma mine, and has reached a depth of 800 feet, cutting in its course, it is said, several large strata of vein matter, and the prospects for the company are represented as flattering. There is a large number of tunnels running into Emma hill, and other mountains in the vicinity, which would require too much time and space to allow of a description.

The North Star Mine

Is the oldest location on the hill, 500 yards west of the Emma, and has made considerable shipments. Owing to company difficulties it is at present idle, although the ore is represented as being of high grade, \$50 to \$250 per ton.

The Alta Consolidated,

On same belt, further west, has recently started up anew, under the management of Mr. Chas. Read, who has engaged 25 men, with the expectation of requiring the services of as many more within a month. It is stated that the mine has an exceedingly prosperous past history, having netted \$300,000. One of Hallidie's wire-rope tramways was seen in operation here, extending from the mine the distance half a mile, to the ore-house in Alta.

The South Star and Titus,

One of the oldest locations on the hill, comes next in order, with tunnel 600 feet in length, and reaching a depth from surface of 500 feet; an incline also from tunnel 200 feet. The ore is found in deposits—the gangue of lime and iron in sufficient quantity for flux, second class being in demand for the iron it contains, besides running 5 oz. silver, \$5.00 gold, 15% lead; first class 40 oz. silver, \$5 gold and 35% lead; nearly \$400,000 realized in the gross and paying something over working expenses.

The Flagstaff Mine,

Of Utah (limited). A London incorporation and at present worked by Mr. A. G. Hunter, who has leased it for ten years. It is one of the prominent mines of the district and Territory having been worked steadily for the past five or six years, and turning out an immense amount of valuable ore. It was first opened by a shaft 400 feet and by tunnel tapping the bottom of shaft. Another shaft has since been sunk 500 feet from tunnel level and explorations made right and left, showing well-defined walls, with veins of ore and ledge matter between from 50 to 250 feet. Character of ore, argentiferous galena and carbonates, carrying a considerable quantity of oxide of iron (gold-bearing); value of ore ranges from \$40 to \$50 per ton. Number of tons sold for January, something upwards of 1,800. The ore is conveyed by a double track tramway the distance of 1,300 feet by the force of gravity to the ore-house.

The machinery consists of two large air compressors, near the ore-house and 1,700 feet from hoisting engines inside of the tunnel, which supply the power not only for engines and pumps, but also for a couple of Ingersoll drills, which are doing good service in this mine. It is well opened and systematically worked. Mr. Moses Hirschman, formerly of Gold Hill, Nev., has charge of the mine and the oversight and guidance of the labor of some 90 or 100 men. The prospects for fine returns were, perhaps, never more encouraging. Many large ore bodies are in sight, and all the arrangements are such as to facilitate the work of extraction and shipment, and a good time to come may be confidently anticipated.

A Few Mines of Big Cottonwood,

And only a few were visited, owing to the depth of the snow and the height of the mountains. The account of

The Reed & Benson

Was kindly furnished by Mr. H. C. Goodspeed, of Salt Lake, and is submitted without change. This mine is located in Big Cottonwood, just over the divide from the Flagstaff mine in Little Cottonwood. It was located early in the summer of 1870 and is owned by H. C. Goodspeed, Franklin Reed and others. The altitude of the discovery is said to be the highest in the Territory—a little over 11,000 feet above the sea-level. The position of this mine was very inaccessible and made a large outlay of money necessary to build roads, trails, tramways, etc. The tramway is one of the greatest enterprises of the kind in this, and perhaps, any other country, being 1,700 feet in length, on an angle of 37°, and going over a perpendicular bluff 400 feet high the rest of the distance. The road is all housed in to be available in winter. It is a double track, and the loaded car down takes the partly loaded car up.

The developments on the mine consist of a tunnel, which they are now using, 500 feet in length and about 300 feet below their upper workings. Below this tunnel there have been extensive explorations in inclines, drifts, shafts, etc. The vein is a true fissure and the ore high grade; the four qualities assaying, say, first quality, 69% lead and 250 ounces of silver; second quality, 40% lead and 90 ounces of silver,

and the third quality, 30% lead and 65 ounces of silver. As a flux it is one of the strongest found in the Territory, as it carries no silica, and the gangue being peroxide of iron.

For the past two years there has been some disturbance in the vein and the ore seemed to be confined to cross-cuts and pipes, but at a depth of about 1,000 feet from the surface the vein seems to have been recovered, and the ore and the direction of the vein agree with the upper workings, where the vein was regular. The production of ore for the past year has been small but the present prospects of the mine are exceedingly flattering.

The Antelope and Prince of Wales,

The property of Walker Bros., Salt Lake; location, near the head of Silver fork, Big Cottonwood canyon. This mine has been continuously worked about seven years, during which time developments have been made to the extent of nearly four miles in aggregate of shafts, winzes and tunnels, stopping to the amount of several thousand fathoms not included.

Piloted by the Superintendent, Mr. W. E. Hall (who, by the way, is entitled to much credit for the admirable system displayed throughout—it could not be better), one long tunnel (2,360 feet) was passed through, following the vein through the limestone from its mouth on one side of one of the highest ridges in Utah, till daylight was seen on the other. The main shaft in the center, also following the vein, is 1,030 feet deep, over which the hoisting works are placed, said to be at the greatest elevation of any in the known world, the altitude, 13,300 feet above the level of the sea. The vein (pronounced a true fissure—why not? with similar characteristics in slate or granite it would be so called,) varies from one to three feet, in places from seven to ten feet, and carries in the best chimneys ores of high grade. The number of men at present employed is about 65, and the daily product of mine will run about 250 sacks, or from 10 to 12 tons of ore, with assay value for first-class of about \$200 per ton, and for second, from \$75 to \$100. The machinery is of the very best, and consists of two 40-horse engines, the hoisting engine having a capacity of about 200 tons per 24 hours, also one very large air compressor (Bowers's), one 20-horse engine, two Ingersoll drills, of three cylinders—the compressor running the engine and drills and said to be adequate to the driving of half-a-dozen more if required. In summer, water is supplied to the mine by means of a Knowles steam pump, No. 6, situated a mile distant, and is conducted in a two-inch iron pipe. From what has been said, it is scarcely necessary to state that the property is remunerative.

A. C. K.

Difficulties of Mining on the Comstock.

The great difficulties met with and overcome by the miners in the development of the lower levels of the Comstock, says the *Gold Hill News*, can never be fully understood or appreciated by the outside public. For instance, how many are there who understand the force exerted by swelling ground, that will crush timbers 16 inches square to splinters in a single night, and close a drift as effectually, during the absence of a single shift, as before its excavation? Yet such is often the case, and the men are compelled to work continually for weeks to keep a drift open sufficiently for use or to conduct air.

In other places the miners are often compelled to labor in a suffocating atmosphere of superheated steam, ranging from 110° to 140° Fahrenheit. In such places there is always more or less water, almost hot enough to scald the flesh, seeping from the roof, sides and faces of the drift, which creates vapor so dense that the lights used by the men can only be distinguished at a distance of a very few feet. Yet men must dig, blast and burrow their way through it all without ever a thought of turning back.

In many places the miners are obliged to sink shafts for weeks at a time, without ever seeing the bottom of the shaft—the drilling, blasting and excavating of the rock all being done below the surface of the water. There are many places on the lower levels where the heat is so intense that the miners take turns of from five to ten minutes in the face of a drift, and then, dropping their tools, seek a cooling room, made tight enough to contain the fresh air sent from the surface, where they rest the same length of time, and then return to take the place of their exhausted comrades. Thus they labor during a shift of six and sometimes eight hours. Men at work on the lower levels in these hot places, never wear more than one pair of drawers made of some light material, and a pair of shoes to protect the feet. The rest of the body is perfectly nude.

Blowers of immense power are employed to drive the air from the surface down through long pipes into the mines. This volume of air when started is a perfect whirlwind, which gradually dies out as it traverses the heated pipes and loses its force until, when it reaches its destination, it hardly has a cooling property left. Many tons of ice are used daily in our mines, winter and summer, in order to furnish a palatable drink for the miners.

It is necessary to use engines and pumps of a power and capacity that astonish engineers from other portions of the world. In a large proportion of our mines it is necessary, after extending the heavy pumping machinery to the bottom of a perpendicular shaft 1,200 and sometimes 1,500 feet, to then carry it down an incline shaft 45° 1,000 or 1,500 feet further. The

hoisting machinery in use for raising and lowering the workmen, has been strengthened, improved, and made as secure and safe as the mind of man can contrive, but is often run at a rate of speed, in hoisting and lowering, that to persons unused to such swiftness of motion, creates, when descending into a mine, the impression and feeling of an actual fall—a check sufficient being made, just at the last critical moment, to land them safe at their destination.

In mines like those of the Consolidated Virginia and California, where large bodies of ore are mined, the space left vacant by the extraction of the ore is filled with solid timbers 14 and 16 inches in size, leaving only narrow passage ways for the workmen and cars used in the conveyance of the ore to the shaft. This, although very costly, is a necessity in order to secure the mine against caving and protect the lives of the laborers. All such mines are obliged to employ watchmen, whose business it is to see that no miner shall accidentally or carelessly leave a lighted candle where it can start a conflagration. A fire in a mine creates a suffocating, deadly gas, which will in a minute's time asphyxiate the strongest man.

Floods of water often burst suddenly into drifts, completely flooding a mine, and sometimes adjoining mines, as was the case a few months since in the Hale & Norcross and Savage mines. Immense caves are liable to occur, hoisting works may take fire and burn up, sudden explosions take place, and a thousand other casualties and mishaps are likely to occur, which make the life of a miner one of continued danger and hardship, and the cost and risk of mining investments one of the most hazardous occupations followed by civilized man.

RESTING SPRINGS DISTRICT.—We have for a long time endeavored to find out something in regard to this district, but have, until a few days ago, been unable to obtain anything reliable. Mr. J. P. Taylor, general agent for the Kern and Inyo Stage Company, has kindly furnished us with the following information: The distance from Mohave to Resting Springs, by the new road laid out, is 135 miles; from Resting Springs to San Bernardino the distance is 190 miles. The district has heretofore been reached via San Bernardino, but as a distance of 55 miles will be saved by taking the Mohave route passengers and freight will, as soon as the new road is completed, go in via the latter. The Kern and Inyo Stage Company, in conjunction with citizens of Mohave, have raised funds and sent out men to make surveys and complete the road. The greatest difficulty encountered is on the first 50 miles out from Mohave, where natural streams or springs have not yet been found. Wells, however, will be sunk in several places, so that that obstacle will be overcome. It is an excellent route for the entire distance, and teams will soon be running over the new road. In a short time this stage company will put on a line of coaches, and from the favorable reports received from that section no doubt there will soon be considerable travel to that district. A furnace has already been started under the most favorable auspices for success. The ledges are said to be large and well defined, and carry high grade smelting ores. Mr. Anson Cross, who is well known, is one of the leading men. We shall expect to have to chronicle some interesting and favorable reports of this new and almost unknown district.—*Coso Mining News*.

BANKERS AND BROKERS.—A telegram from the East gives an important and interesting opinion by the Commissioner of Internal Revenue on the liability of brokers to be taxed as bankers. Referring to a letter addressed to him on this subject by Senator Stewart, the Commissioner writes that relative to the proposed assessments against certain brokers of San Francisco who had been reported as liable to internal revenue taxes as bankers, 72 of said brokers have forward affidavits on printed forms and prepared for the use of individuals and firms; that, admitting the statement sworn to in these affidavits to be true, there appears to be no ground for assessments on any business done during the past 15 months in cases of 69 in the 72 brokers above referred to, and no assessments will be made. The affidavits of the other three and of still another not on a printed form will be returned with leave to amend, as it is believed that certain informalities and omissions noted therein may have been the result of oversight or inadvertence. This view of the case will meet with considerable approval from our brokers in this city, to whom it is especially interesting.

IONE AND ELLSWORTH.—From Stubbs, of the Ione and Ellsworth stage line, we learn that the mines at Ione are looking and yielding well, and that the new mill now in course of erection will soon be completed. In addition to the daily yield of the mines, 500 tons of ore have accumulated at the mill, which will thus start up under very favorable auspices, and with a certainty of a prolonged run. At Ellsworth the indefatigable Wm. H. Raymond, formerly of the renowned Raymond & Ely mine, is hard at work developing the mines in that vicinity, with the most satisfactory results. He is running 10 stamps at present, and is shipping about \$20,000 worth of bullion per month, some of which passes through this city. Dame Fortune is again smiling on this fine old gentleman, whose industry and energy are far superior to those of many young men, and after passing through many vicissitudes he is in a fair way of again being numbered among the powers who rule the financial world.—*Reese River Reveille*.

MECHANICAL PROGRESS.

Setting a Planer.

To set a planer so that there may be no "wind" in its work is an item of great importance. Professor Sweet, of Cornell University, tells the *Polytechnic Review* of his success in this matter: Planing machines vary in size; some take work a foot square through the housings, that is between the side frames; others will plane work 12 times that size. In the following argument, imagine my referring to one about two feet between the posts, as there are probably more of that size in use than any other. It is not possible, at least not practically possible, to construct a frame for such a machine that will not spring by its own weight. If made heavier, then there is more weight to spring it, and if made of any of the ordinary forms and rested upon either two diagonal corners, the frame will spring winding; if supported by the opposite corner it will wind in the opposite direction. If the bed of a planer is winding, nothing can prevent its making the work done upon it winding to exactly the same extent also. To prevent the winding of the bed, assuming it to be first made true, there are two methods.

One is to set it upon a substantial stone or brick foundation. To set the machine is a delicate operation, and the foundations are so costly that but one in a hundred of this size are ever placed upon them. The other plan is the one I have adopted, and with the very best success. It is supporting the machine upon the single support at one end—in other words, resting the machine on three points. I can hardly conceive it possible for any one to have a better test than our surface-plate work; for before this was done we could plane them winding either way at will by simply loading the floor on which the planer rested, while now it is seldom that we detect the slightest difference. If there is any one thing that I think I know better than another in regard to machine construction, it is that all machines likely to be set upon a floor, which cannot be supported upon a single column, as our milling and shaping machine, should be rested upon three points. As certain as a surface-plate cannot be made true unless rested upon three points, so certain is it that a machine cannot be kept true unless supported on the same principle.

Mechanical Progress in France.

Regarding the progress made in the industrial arts in France, taken from a census recently made of the working and material developments, it appears that the total machine force of the country is at present 1,500,000-horse power, representing a force of 4,200,000 draft-horses, or 31,500,000 men—that is to say, ten times the valid industrial population of France. This substitution of machine-work for hand-work has produced an economical revolution in French industry, which it is interesting to compare with the industrial state of France in 1788 before the introduction of machines. The first steam engine that appeared in France was set going in 1789. It came from the manufactory of Boulton & Watt, at Birmingham, and was used for the water supply of Paris. Unfortunately, from the great revolution of 1815 machinery industry in France almost disappeared, and it was not until 1825 that the French began to manufacture steam engines, and many of their manufactories now rival those of England. In 1852 France possessed only 6,000 steam engines, representing a force of 75,000 horses. In 1862 the number of engines had risen to 22,500, and the horse power to 618,000. From this year the increase was extraordinarily rapid, until, as stated above, the horse power of the steam engines in France attained 1,500,000 last year. In 1788, of one milliard of manufactured products 60% was workmanship and 40% raw materials. To-day the proportion is exactly the reverse; the workmanship is 40% and the raw materials 60%, and yet it must be remembered that workmanship has increased 40% during the past 20 years. To-day the annual production of France is about twelve milliards, of which the raw material is seven milliards, and the workmanship five milliards, whereas in 1788 the workmanship would have cost eleven milliards. It results from this, that the introduction of machine work has led to a saving of six milliards in the workmanship.

A NEW KALEIDOSCOPE.—An improved form of kaleidoscope, by M. Thomas, of Paris, has been reported on favorably by the *Société d'Encouragement*. The two mirrors are, as usual, put in a tube; but the objects employed to produce the images are enclosed in a transparent case, which is separate from the tube. This case, almost flat and with its two faces formed of watch-glasses, is supported by a rod, which is fixed to the tube by a hinge. It can also receive a movement of rotation round its axis of suspension. In this way it can be inclined in any direction to the axis of the tube. A button, manipulated with the hand, enables one to turn it about its center, so as to change the positions of the objects within. A pasteboard disc, white on one side, black on the other, is placed behind the case. Transparent or opaque objects may thus receive light on one or the other side of the case and be detached on the white or black background of the disc, according as it may be desired to observe them by transmission or reflection.

The Advantage of Good Tools.

A trade is not generally well learned until we can take care of the tools—at least not until one knows what is the matter with bad tools and how it should be remedied. The poor workman cannot always do this, but he should take care that his tools are looked after by some one who knows how. Good tools pay. The *Iron Age* says: We have in mind two brands of tools, so much alike that the eye could find no difference, yet when at work the difference in temper and material is such that the high-priced tool will pay for its extra cost every day it is used. Good tools help to make good and careful workmen. If any of our readers doubt this statement they have only to go to the bench and undertake a job of any kind, using first the poorest tools they can find in the shop, and then doing their work over again with good tools. The nervousness and dissatisfaction caused by a poor tool is in itself almost fatal to good work. Take the case of a foot-lathe. With loose spindles, center out of line and an uneven bed, we are so troubled and annoyed that we have very little attention to bestow upon the work in hand. We are, in fact, always fighting hopelessly with our "environment." We do not wish it to be understood that we think boys and apprentices should have the best tools that money can buy, but we do think they should have tools which are perfectly suitable for the work they have to do, and with which a good workman could not find fault if set to do the same class of work.

In learning to use tools, the old hand as well as the young one should not forget the fact that the natural way is seldom or ever the right way. Skill is not natural, and the right way is the result of the skill. Hence, we find that the beginner attempts to do work very differently from the experienced hand, and it is not altogether wrong to allow him to work in what he finds to be the most convenient way at first. As he gains skill he can change his method of work. His tools may be suited to his lesser experience.

Strength of Metals.

The Ashtabula disaster is calling forth anew all experiments which are on record concerning the strength of metals when under tension. The *Manufacturer and Builder* calls attention to the labors with which Prof. R. H. Thurston, of the Stevens Institute of Technology, Hoboken, N. J., has been occupied during the last few years.

These experiments show that metals may be divided into two classes, of which iron and tin are the types, the first of which offers greater resistance to slowly produced strain and distortion, while the latter, on the contrary, offers greater resistance to rapid than slowly produced strain. This difference of behavior depends on the ability of wrought iron to "flow"—a property which lately has attracted considerable attention, and consists in an interior hidden molecular movement which rearranges the internal adhesions and releases internal strain, being a phase of that viscosity which Vicat supposed might in time permit rupture of metal subjected to stress nearly approaching its original ultimate resistance. Two pieces of tin, from the same bar, were broken by tension, the one rapidly and the other slowly; the first broke under a load of 21,000 pounds and the latter of 14,000 pounds. Alloys of copper, such as brass and bronze, behave in a manner similar to those which belong to the tin class. It is the contrary with iron, and records of Prof. Thurston's laboratory illustrate the proposition that metals which gradually yield under a constant load offer increased resistance, with increased rapidity of rupture.

COMPETITION CHEAPENING ENGLISH HARDWARE.—The *British Trade Journal* says: The new year has not up to the present brought about any noticeable improvement in the hardware trade, which experienced an anything but good time of it during 1876. The official returns show that shipments fell off to the extent of £783,474 in the year, and the only country that took goods on a larger scale than in the previous year was Spain. The Argentine Confederation bought less than half the usual quantity of hardware, and shipments to the United States, British North America and the Spanish West Indies were 35% to 40% less. The great American market is slipping away, and manufacturers beyond the Atlantic are entering vigorously into competition with British houses in the Canadian market. Especially is this competition felt in locks, bolts, butts and hinges, gas and boiler tubes, electroplates, scales, polished steel goods and various kinds of hollow-ware.

CAPTAIN EADS'S SUCCESS.—Captain Eads has received the first installment, \$500,000 in U. S. bonds, on account of the payment for his Mississippi jetties, which have proved, as we always predicted they would, a grand success. The U. S. ship *Plymouth* has passed through the line of jetties at low water, and is the first war vessel to traverse the new channel. She drew 17 feet of water, and the least depth found by the lead was 18 feet. The passage of the upper jetties was made by the ship under full steam power in eight minutes and 17 seconds. Between the jetties there is a channel 24 feet deep and 200 feet wide. At the head of South pass there is a minimum depth of 27 feet. On the charts of 1873 the last mentioned sounding was but 16 feet; and at the mouth of the pass, at mean low water, the lead showed but three, four, and seven feet.

SCIENTIFIC PROGRESS.

Analysis of Fungi Poison.

L'Imparziale has an article by Professor Schiff, late of Florence, in which the author remarks that it has been commonly thought that each species of poisonous fungus produced its own special symptoms. An analysis of the phenomena observed, however, shows that such a distinction is inadmissible, since all the differences can be reduced to varieties in the degrees of action on different systems of the organism. It is, indeed, probable that there is in all poisonous fungi one fundamental deleterious principle, and this is probably muscarine, discovered by Schmiedeberg, of Dorpat, in the *Amanita muscaria*. Other noxious principles which may coexist, and vary in different species of fungi, account for the differences which may be presented in the symptoms of individual cases of poisoning.

Animals (dogs and cats), poisoned by muscarine suffer the following symptoms: Abundant salivation; marked slowing of the heart's action; nearly corresponding decrease in the number of respirations; increased contraction of the intestines, the contractions being more tonic than peristaltic in character, and the evacuations containing more mucus, and occasionally blood, and fibrillary movements of the muscles.

The symptoms enumerated are opposed to those produced by belladonna, datura and other solanaceae, and Professor Schiff has investigated the capability of these to act as antidotes to poisonous fungi. In the four experiments he had been able to make, datura stramonium was administered to animals poisoned with a mixture of fungi and fat.

Although daturine produced cerebral phenomena resembling those caused by poisonous fungi, and also a remarkable diminution in the excretion of urine, as regards all other symptoms of poisoning by fungi, paturine and the alcoholic extract of stramonium are antagonistic.

Two distinct toxic substances probably exist to poisonous fungi, viz.: muscarine, the action and antagonism of which to stramonium and belladonna have been mentioned, and another, whose effects on the system are analogous to those of atropia and datura.

Schiff recommends the treatment first proposed by Dr. Lauder Brunton, and based upon the experiments of Schmiedeberg, viz.: the use of atropia, datura, or stramonium in substance, or as an alcoholic extract.

THE FORMATION OF PETROLEUM.—The formation of petroleum has been explained by Mr. H. Byasson upon experimental grounds, as follows: If a mixture of vapor of water, carbonic acid and sulphureted hydrogen be made to act upon iron heated to a white heat in an iron tube, a certain quantity of liquid carburets will be formed. This mixture of carburets is comparable to petroleum. The formation of petroleum can thus be naturally explained by the action of chemical forces. The water of the sea, penetrating into the cavities of the terrestrial crust, carries with it numerous materials, and especially marine limestone. If the subterranean cavity permits these new products to penetrate to a depth where the temperature is sufficiently high, in contact with metallic substances, such as iron or its sulphurets, we have a formation of carburets. These bodies will form part of the gases whose expansive force causes earthquakes, volcanic eruptions, etc. Petroleum is always found in the neighborhood of volcanic regions or along mountain chains. In general it will be modified in its properties by causes acting after its formation, such as partial distillation, etc. Petroleum deposits will always be accompanied by salt water or rock salt. Often, and especially where the deposit is among hard and compact rocks, it will be accompanied by gas, such as hydrogen, sulphureted hydrogen, carbonic acid, etc.

SPOT ON SATURN.—On December 7th, 1876, Prof. Hall, of Washington, observed a small white spot on the planet Saturn. It was on the dark belt, just below the ring, and crossed the central line at 6h. 18m. Washington mean time. It was between 2" and 3" in diameter (i. e., between 8,000 and 13,000 miles) and very well defined. Notice was immediately sent to different astronomers, and during the next week, in spite of the unfavorable weather, it was observed on two evenings by five observers at various stations. These observations give a very good determination of the planet's rate of rotation, which comes out almost exactly 10h. 15m., with a probable error of not more than a minute or two. The result agrees very nearly with that obtained by Sir William Herschel, in 1793, viz: 10h. 16m.; but is quite different from that stated in most of the school and college text-books, which is 10h. 29m. The latter is undoubtedly wrong and it is not quite clear how the error first came to be made.

THE GREAT GRECIAN EXPLORER.—Dr. Schliemann, whose archaeological discoveries in Asia Minor and Greece have made the world ring with his fame, is a naturalized American citizen. He was for some years in the banking business at San Francisco, whence he removed to Indianapolis, where he was naturalized. The bulk of his property consists of American securities and some considerable real estate in this country. He left the United States only eight or ten years ago to undertake the archaeological enterprise he has so successfully pursued abroad.

The Earth Drying Up.

One of the most curious and we believe well substantiated inferences, drawn by those geologists who have devoted attention to the chemical metamorphoses which the rocks composing the crust of the earth are subjected to, says the *Polytechnic Review*, is the conclusion that the earth is gradually losing its water, or drying up. It is generally assumed that the evaporation of the water from the surfaces of our oceans, lakes, rivers, etc., is practically balanced by the various forms of precipitation, rain, snow, hail, etc., from the clouds, by which it finds its way again to the earth. This is strictly true in the sense that not a particle of water passes beyond the limits of our atmosphere, and all that finds its way into the atmosphere by evaporation sooner or later is returned again. Nevertheless, the water supply of our earth is slowly but steadily diminishing. It is not destroyed, but is so modified as to be no longer available for the sustenance of animal or vegetable life; since it is absorbed and bound up in the rocks. This disappearance of water is to be accounted for partly by mechanical absorption, partly by the hydration (or binding of water), which is generally one of the phenomena attending the superficial weathering of the rocks, and partly by the crystallization and recrystallization of the constituents of many of the rocks, and the extensive chemical changes going on at unknown depths within the bowels of the earth, as manifested in the phenomena of volcanoes. In the course of time, though happily many ages from the present, the combined result of these several causes of desiccation must be the complete absorption of all the water, and its disappearance from the surface of the earth.

The estimate has been made that about one-seventeenth of the original quantity of water the earth was provided with has already been bound up in the rocks or absorbed beyond the possible reach of the organisms living upon her surface.

AUSTRALIAN EXPLORATION.—The Australians are diligently exploring their great country. We learn from Queensland that the Northwest Exploring Expedition, which arrived at the Falls, Leichhardt river, on the 19th of October, all well, reports that the country from the Cloncurry gold fields to the head of the Southern branch, and thence tracing the course of the Diamantina to the South Australian boundary, and onwards to the 27th parallel of latitude, has been thoroughly examined. The party returned round the western boundary of Queensland. A connection was established between the furthest point reached by Captain Sturt, in 1846, and the extreme southern point attained by Landsborough, where a large area of pastoral country awaits occupation. The Herbert river, after running a short distance into South Australia, re-enters Queensland, and joins one of the principal heads of a large river, named the Mulligan, flowing through Queensland territory to the 26th parallel of latitude. The country is superior to the Diamantina. It possesses fine lakes and an ample supply of salt, with a splendid herbage. It is flanked on the western side by a sandstone range named after Governor Cairns. The extreme drouth caused much suffering to the men and horses, and three of the latter perished. It being impossible to reach Cloncurry depot direct, the party crossed the northern watershed, and followed down the Gregory, thence over to Leichhardt falls, from whence they were making for the depot through settled country. They came via Normanton to announce their safe return, and complete their instructions by traversing the Gulf shores. The most amicable relations were preserved with the natives throughout the course of the expedition.

ENGLISH FISH CULTURE.—The pisciculturists of England are making strenuous efforts to improve declining or nearly ruined fisheries and render them of value as food producers. The *London Times* of the 9th ult., says: A large and very healthy consignment of salmon and trout eggs from the Rhine, Lucerne and Geneva have lately been received in London. The salmon eggs were all gathered from Rhine fish, collected and packed under the advice of Herr Haack, of the famous fish culture establishment at Hunningue. The process of packing is described as very simple. The eggs are counted out into thousands (an extra hundred being given in for losses). They are then carefully inclosed in gauze and lightly packed in some well cleaned soft moss. The boxes are tied up all together in handy parcels and sent off to their destination, great care being taken in transit to prevent the eggs from being shaken. In the present instance the ova received by Mr. Buckland arrived in fine condition.

STILL WORRYING THE SUN.—M. Mouchot is continuing his experiments in utilizing the heat of the sun. He has lately shown to the Academy of Sciences a small still, in which the sun's heat was applied to the processes of distillation. With this still, the mirror of which was 20 inches in diameter, the inventor succeeded in distilling a quart of wine in half an hour. With a mirror five times as large, the inventor believes he will be able to distill 20 quarts in the same space of time. The seasons make but little difference in the working of the solar still, provided the sun's rays be not intercepted; and M. Mouchot has brought water to the boiling point in January, in a boiler standing in the open air and covered with ice and snow.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

Mechanics.—*Amador Ledger*, March 3: The old Downs mine of Sutter Creek has been running on rock from this mine for the past two or three weeks. Some 150 tons have been put through and a clean-up will be made next week. A large proportion of the rock crushed is from the boulder, and not from the regular ledge. The men are now running a tunnel at the 500-ft level.

COMET.—This claim is situated on the hill between Sutter Creek and Amador City. Years ago a shaft was put down 90 feet, when the mine was abandoned. Later the mine has been bonded by Mrs. John Mahoney to H. Rees and Jerry Mahoney for the sum of \$10,000, \$1,000 down and the balance at the expiration of the term. Men are now at work sinking a new shaft. The rock prospects well, some of it yielding as high as from \$20 to \$30 per ton.

ITALIAN QUARTZ LEAD.—This property is near Drytown, between the Seaton and Loyal mines, and is thought to be a continuation of the lead now being worked in the Dover. For the past three months the claim has been worked by three men. A shaft is down 30 feet, and the other day a ledge four feet wide was struck. The ore is of good milling quality.

There is a stretch of country along the line of the great mother vein, between the Drytown mine and Plymouth, some three or four miles in extent, over which prospecting is going on at a lively rate, with gratifying results. Not a patented mine exists in all this mineral region, but the labors of the prospectors are proving it to be as rich in auriferous treasure as perhaps any part of the main lead. The Centennial mine, near Dry Creek, is as likely a prospect as there is in the county. It is owned by a number of Italians. A shaft is down 35 feet, the ledge, which is from 10 to 15 feet wide showing, unbroken appearances from top to bottom. The ore is of high grade, and all the indications point to a permanent mine being developed in this locality. We are informed that a new town site is being surveyed in this neighborhood, and it is not at all unlikely that a flourishing mining camp will spring up during the coming summer.

Cart Box.—A prospecting party has started this side of the Beck mine. He has started three men to work in running a tunnel.

BUTTE.

Dry.—*Oroville Mercury*, March 2: The present winter has been one of the driest in the history of the State. While we have had frequent rains, but very little snow has yet fallen in the mountains. Where it fell to the depth of 20 feet last year, only about two or three feet can be found now. Everything indicates that spring is near. The days are warm and sunny, the birds have begun to build their nests and the trees are budding or in full blossom earlier than last year. These things leave us no hope for heavy storms this spring. By the middle of June, at furthest then, the snow that usually feeds our rivers will all be gone. The river, at the present time, is about as low as in July, during ordinary seasons. Starting in March with very little water, and with no snow of any consequence in the mountains, the river has kept up the usual stream, with little to prevent our river—the Feather—from dwindling down to a very small, insignificant stream before the 1st of August? We call particular attention to this for the reason that parties have been waiting for years for just such a season during which to mine the bed of this river. Now they will have an opportunity not met with. Already the matter is being talked up by those who have not been able to do a stroke of work in the mines along the foothills on account of the lack of water. We hear, too, that parties are making arrangements with Messrs. Hedge & Walker to put an engine and derrick on the bank of the river and mine the bed of it as far as the arm of the derrick will reach. This kind of mining can be done easier and cheaper this year than ever before. Already the effect of the dry season is beginning to be felt here in Oroville. During the winter months nearly every man about town who has nothing to do takes his pick and pan and goes to his mining claim with the intention of taking out some gold. Most of them are successful, and return with a few hundred dollars' worth of dust. All the small claims in the foothills are worked by their owners and more or less gold taken out. It is usual at this season of the year to see a dozen men standing at the counter in the bank with gold dust ready for sale. But this year all is different. Only now and then does a miner make his appearance, and then only with a small lot. "No water," is his reply to the inquiry as to how he has done. It is true that many claims will be worked this year the same as last, because they have an abundance of spring water brought in from a long distance by means of ditches; but it is also true that nearly one-half of our golden harvest will be cut off by the present dry winter.

CALAVERAS.

Struck the Lead.—*Calaveras Citizen*, March 3: We learn in the Pioche mine, at Sheep Ranch, owned by W. E. Norman and W. H. Clary, a lead several feet thick has been struck in the tunnel. As this is the extension of the Ferguson and Wallace lead, there is a good prospect that it will develop something of value.

Lamphear.—*Calaveras Chronicle*, March 3: Things are going on swimmingly at the Lamphear mine under the superintendence of Mr. Staples. The mill is running and there are 150 tons of ore on the dumps. The new management is starting in right and we expect the Lamphear to flourish like a green bay tree.

Upper Country Jore.—Work is progressing on the Zacher mill at West Point. Stopping out ore continues at the Champion. The company owning the Mina Rica have commenced operations upon an adjoining mine. Sixty tons of ore have been hauled from the Chapman mine to the mill. Clark's hydraulic at Independence is in full operation.

Hughes's Quartz.—We understand that the ore from Hughes's quartz mine, in Chile gulch, lately crushed in the mill owned by the company, paid well. The work of mining ore is progressing actively.

EL DORADO.

Richness.—*El Dorado Republican*, March 1: The product of the 25 days' run at the St. Lawrence mine was brought over to town yesterday, and was a sight to behold. It consisted of four lumps, as retorted, of pure gold, the largest of which weighed between 50 and 60 pounds, but it is not to be weighed when we went to press, but it is estimated to weigh between \$30,000 and \$35,000—the whole clean-up.

We notice a greatly increased inquiry of late for partially developed quartz lodes in this county. The fact that most of the capitalists who have for years been operating exclusively in mines on the Comstock lode, are now investing heavily in California mines, is opening the eyes of our people, and they are soon expected to see California stocks taking the lead in the boards.

From reliable authority we learn that at the 500-ft level a fine ledge was struck last week in the Taylor mine, and that everything was looking well. There can be no doubt of the Taylor's being a good mine, if worked for all it is worth; and that the Rosekrans is just as good, and that either is worth \$50,000 at least, any day, to a company with a little money, if properly worked for just what there is in them.

This river claim owned by Col. Wm. Jones & Co., above Chile Bar bridge, efforts to work which have been foiled the past two years by high water at inopportune times, will doubtless be thoroughly worked this season. The river bed, comprising their claim, has been pretty well prospected, and the owners are confident of taking out \$100,000, at least, before next November.

INYO.

More Stamps.—*Inyo Independent*, March 3: Mr. Nelson informs us that the Eclipse will start 10 additional stamps next Monday, making 30 in all. Capt. Eudey and Mr. Hubert have gone to San Francisco to procure additional machinery and to perfect other arrangements, to add batteries as fast as possible until at least 100 stamps are in operation in the mill. To keep this, or even half the number supplied with ore, will, no doubt, require the substitution of steam in place of horse-power on the tramway, and it is quite likely the first locomotive to put in Inyo county will be found on that three-mile railroad at the Eclipse.

Defiance.—*Coso Mining News*, March 3: The Defiance mine is looking well in all its different workings and the hoisting machinery is operating well. Ore is being taken out in considerable quantities, being delivered at the furnaces, and the latter will be started as soon as coal can be obtained.

McPhie. who was for a long time foreman of the Hemlock mine, owned by the S. V. M. & W. Co., at Panamint, has received the appointment of foreman of the Modoc company's mines at Lookout.

NEVADA.

Mining Situation.—*Grass Valley Union*, March 1: The mining business has never been better in Grass Valley than it is to-day. In almost every ravine and on almost every hill in the district the prospectors are busy. Picks, pans and shovels are in constant use, and the noise of the prospecting hand mortar can be heard almost anywhere in the low level of the valley. The prospecting is coming to this place, and it has the assurance of fair and honest treatment even if it does not get four-fold returns in a few short hours. We give below something of a summary of work done in this district, remarking that we have omitted to report from many enterprises that are being prosecuted.

In the Eureka they are hunting for a paying ledge in the lower level, under the supposition that more gold is there, because millions have been taken out. Cross-cutting in hard ground continues.

The Empire is the oldest mine of the district and looks better now than it did 20 odd years ago. It pays regular profits.

In the Idaho there have been no changes in it for a long time, and underground indications say there will be none for some years to come. Monday the Trustees will meet and declare the 91st dividend. We have heard of no sales of the stock of the Idaho for more than a year. The mine is managed after its old way of economy and perfect system.

The Omaha is again giving promise of doing well. The shaft is now down 650 feet and is being rapidly put down, and when the depth of 700 feet is reached another ledge will be opened. The lower 100 feet of the shaft has a good ledge, from 15 inches to three feet in thickness, and the ore is estimated as being worth \$30 per ton. The levels are four in number, and the longest is 750 feet. The mill, of 18 stamps, is kept running day and night.

As the Homeward Bound has sent out very fine ore in the past, and as there is not a single indication of barrenness in the underground workings of the mine, it is almost certain that at a depth of 300 or 400 feet at the south point will show a good mining property.

The Centennial is still doing well. The main shaft is down 250 feet, and there are two main drifts—the first 300 feet and the second 85 feet. Fine ore is coming from all parts of the mine. A crushing of 150 loads is now going on at the Orleans mill, and the clean-up will give some \$100,000. One brick of a value of between \$4,000 and \$5,000 has already been taken from the mill during the present crushing. The Centennial will probably keep the Orleans mill constantly at work. The 10th day of this month will be dividend day, and \$1 per share will be declared.

Tus Coc is still idle, and there is no immediate prospect of its starting up.

A consignment from the Alaska of 50 tons of ore gave about \$50 to the ton. The rock crushed at that time was not selected, but was put through just as it came out of the drift, and therefore contained a considerable quantity of waste. A crushing is now going on and it will yield much more than the one noted above.

At the Allison Ranch Phoenix a 10-inch cylinder steam engine is being put up for hoisting and pumping work, and in a few days the systematic development of the mine will be in progress. We yesterday saw some specimens from the ledge, taken from the grass roots, which showed well in free gold and rich sulphurets.

The Kentucky Ridge is at the head of Kentucky flat, a place once famous for its rich placer diggings, and which abounded in large nuggets of rough and unwashed gold. Two tunnels have been dug for the purpose of staking the ledge. The upper tunnel is into the ledge and has drifted upon it for a distance of about 75 feet. The lower tunnel is now in about 200 feet and work on it is progressing day and night, with eight-hour shifts of hands. The work on the lower tunnel is being done by contract. By the time this tunnel is completed a mill will be erected and in operation. At first the mill will be one of 10 or 15 stamps, and the average yield per ton was \$25.

The Rough and Ready hoisting and pumping machinery has been running several days and works to a charm. The mill has had a trial run and everything proved satisfactory. In the early part of next week the 10 stamps will begin their regular work. The ore in the tunnel has improved of late, and an excellent quality is coming out of the shaft.

The French ledge was formerly known as the Buckham, and is situated about 15 miles from Grass Valley, near Bear River. Several shafts have been sunk upon the ledge, making explorations for some 300 feet. The last of the shafts was sunk some three weeks ago to the depth of 40 feet, and it shows a big ledge two feet thick in the bottom. Free gold can be seen all through the rock. About 21 tons of the ore have been brought to Grass Valley and milled, and the average yield per ton was \$25.

On the Inkerman arrangements have recently been made for the erection of steam machinery for hoisting and pumping purposes, and in a short time that will be ready for working, when a thorough test of the ledge will be made.

Grass Valley New company is a prospecting organization, formed at home for the purpose of working a variety of claims in a chance for success. The company is now sinking on a ledge northeast of the town and the prospects are encouraging. Sparrowhawk, in Woodpecker ravine, is being constantly worked. The ore has improved since the first crushing made, and that gave \$24 per ton. Modoc, in the Allison Ranch neighborhood, and is near the East Franklin. The tunnel is in 120 feet and is being pushed with all the force of the hill, and has a depth of 140 feet, with a ledge of from eight to ten inches thick. The average yield of the ore per load is \$200. Pacific is east of the Allison Ranch Franklin, and distant about 1,000 feet. A tunnel is now in about 150 feet, and in a few days the ledge will be cut. The tunnel will give between 100 and 120 feet of back. The Shamrock ore works by a process in average of \$250 to \$300 per ton. The Allison Ranch Franklin shaft is down 250 feet and the ledge looks well. The mill is kept busy at work. On the Bullion Consolidated preparations are being made to erect hoisting works. Ore out of the mine has averaged \$30 per load. Godfrey mine, on Alta hill, is in gravel, and is worked by drifting. The gravel bed is very rich in gold and the explorations so far made show no limit to its extent. The mine is being put through a new battery, and the clean-up will be large. New York Hill is getting into shape for good work. The upper drift is into the pay chute and the work of opening up the mine is progressing favorably. The force of men has been increased within a day or two. Alpha & Omega, in the neighborhood of the Idaho, is quietly worked.

Corral. Near Spencer'sville, in Rough and Ready township, the San Francisco copper mining company is operating with success. About 3,000 tons of ore are now being burned and after that operation the metal will be secured by the leaching process. The company are now taking out about \$4,200 worth of the metal a month at the expense, for the same time, of about \$2,200. The amount of ore is practically inexhaustible, the thickness of the ledge being about 60 or 70 feet.

Gravel Mines.—The gravel mines in the upper part of the county will have a short run this year, on account of a want of water. The mines there, however, are looking favorably on the drifting system of working, and it is probable that many of them will give up the hydraulic for the drift plan. The Watt mine, just starting near Moore's Flat, will work through drifts and calculate thereby to save more gold in the long run than can be done by hydraulic working.

PLACER.

Mining Items.—*Dutch Flat Forum*, March 1: The various claims continue washing as constantly as the circumstances will permit, some, however, have not yet been enabled to clean-up throughout. The Southern Cross made a partial clean-up a few days since, which proved very satisfactory. The Polar Star fired a blast last week which plugged the incline; the gravel is being wheeled out from below, and it is expected that an opening will be made in a few days. The Franklin is being opened from the rim. The Idaho is working the material loosened by the blast of Judson powder referred to last week. The gravel proves to be more thoroughly disintegrated than the most sanguine could have anticipated. The Star and Union has commenced washing pay gravel, the slide having been stripped off the entire front point. The Summersett continues washing nights only. At Gold Run the Cedar, Indiana Hill, Gold Run and Hoskin claims continue washing.

River Mines.—Work progresses in the Centennial, Crissman and Whipple companies without cessation. The mines continue to look well, and the results encouraging. The two former have disbursed another dividend and the latter is expected to follow suit soon.

You Bet Mines.—The following companies have continued to wash since our last without interruption: Necess & West, W. P. Hussey and Nevada, and are making unusual progress.

Little York Mines.—The Empire and Christmas Hill mines continue to wash with all the energy and power that an efficient superintendent can bring to bear on them, through the aid of skillful miners and large heads of water. They will turn off in a few days to clean up.

The Liberty Hill company continues to wash and are making splendid progress.

Quartz Mining.—*Placer Herald*, March 3: Duncan hill lying between Auburn and Ophir, is at present the scene of considerable activity in the matter of developing the numerous quartz veins with which it is known to be riddled. There have been several rich strikes in the mines of this hill, and it is not unreasonable that on thorough development, some of them will prove rich and lasting.

The St. Patrick company as usual are exercising great activity in the work of extracting and crushing ore. The Julian, on Jenny Lind flat, manages to keep its 20-stamp mill running on paying rocks. The Pugh mill at Ophir, is running steadily on custom ore brought in by the prospectors. Indeed, everything in the quartz line in this section of country is active, and the season promises to be one of increased interest and attended with increasing encouragement.

SIERRA.

Iowa.—*Mountain Messenger*, March 3: The Iowa shaft is not yet down to the bedrock. They were in a streak of good luck, and have now reached a level of 100 feet, and are heretofore reached in the mine. There seems to be good prospecting gravel above where they now are. It is demonstrated beyond question that there is a large channel there.

Pennsylvania Claims.—Messrs. Foss & Steilman have been several months busily engaged in running a tunnel to prospect a supposed channel in Thompson ridge, on Nevada creek, north of Howell ranch. They have a tunnel in about 300 feet and had found a body of gravel, but had not prospected it any when we last heard. Should they succeed in finding pay, it will open up a large tract of mining ground.

The Bunker Hill company quit work on their mine during the last snow storm, but will resume operations again in the spring. They have a tunnel in near 900 feet and are running over the second rim. The tunnel is in conglomerate of bedrock, pipe clay and cement.

SISKIYOU.

Good Clean-Up.—*Yreka Union*, March 3: We learn that the Morning Star mine, on Jackson gulch, recently made a clean-up, and took out of which the owners are to be owners. The company have now excellent rock, and the prospects are very flattering.

The owners of the Star of the West, Messrs. Grant, Patton & Sheffield, are going to put up a four-stamp mill at their mine as soon as possible.

Johnson's Mines.—A. M. Johnson, of Oro Fino, cleaned up the mill of the mine, which had been running for some days on rock from the old Shepard mine, which he has been prospecting recently. The rock paid passably well. He will start the mill up again in a few days upon rock from his other mine. The new tunnel he has been running in this mine is about down, and as a consequence the mine will be in a better condition than ever for working. He will not resume work on the Shepard mine for a while.

SONOMA.

Coal.—*Santa Rosa Democrat*, March 3: We learn that Mr. Davis, another mining expert, who has been engaged in the coal mines of this coast for several years, was here last week making thorough tests and examinations of the Taylor Mountain mine, and pronounces the coal to be of superior quality and in great abundance. As soon as the work is finished from the mine to this city the work of delivering it will be begun.

TRINITY.

Union Hill.—*Trinity Journal*, March 3: The heavy rains last winter so saturated the earth in the flat where the Union Hill claim is located, that great quantities of top dirt broke away and moved bodily down upon the agents, forcing one of them down the shaft and crowding upon the others so fast that it necessitated frequent removal to keep it from sharing the same fate. The ditch conveying water across the claim was also broke and carried away, and the only means of conveying water to wash away the constantly advancing bank of top dirt was through the large 22-inch pipe, with its two giants. When one giant was carried down the shaft half of their power to contend with the mud was lost, and the further working of the claim was abandoned for the season. Last summer Mr. J. G. Trotter, one of the proprietors, purchased the other interests and at once began preparations to prosecute work. A force of hands were put to work in the tunnel and incline, the mud removed and the lost giant recovered. With the first flow of water operations were commenced to wash away the remainder of the slide and they have gained slowly but steadily on it from the commencement of the season. The pipe is run night and day, one relay of hands being always in readiness to take the place of those whose "shift" is off. We visited the claim last Sunday and were gratified to perceive the progress made, notwithstanding the scarcity of water which prevailed in the beginning of the season. The worst part of the slide has been washed away, and that which is left grows constantly thinner as the mud settles slowly downward where the stream from the two giants drives its advance into the incline. A large body of rich gravel was uncovered before the slide came, and if we happen to have a good spring, in all probability Trotter will be able to get at this gravel before operations are suspended for the summer. The dry winter has not been without its advantages to this claim. Though it has cut short the water supply, it has also kept the top dirt so dry that there has been very little caving.

Nevada.

WASHOE DISTRICT.

California.—Daily yield, 550 tons of ore. The ore stops continue to put on the same excellent appearance as for months past, and the ore extracted continues of the same uniformly rich character. The yield for February insures the payment of the regular monthly dividend of \$2 per share. The opening up of the ore vein on the 1600-ft level continues to prove its extent greater and its value

more enduring with every step of progress made. On the 1650-ft level the ore prospects are still showing richly on every hand. No one can speak positively of the extent of an ore body until it has been developed, its measurement taken and its value determined. But when the width and character of a vein and ore body are known, and openings like the sinking of the Consolidated and California winzes, penetrating the ore 100 feet perpendicularly, and the connecting drifts on the 1650-ft level are made, there can be no longer doubt as to its continued prosperity to an indefinite future period of time. The California pan mill has been shut down for repairs, as it has been running without renovation steadily for the past year.

CON. VIRGINIA.—Daily yield, 285 tons of ore, keeping the Con. Virginia mill steadily running. The connecting drift with the Best & Belcher and Gould & Curry, on the 1200-ft level, is being steadily enlarged and put in the best of repair as a source of ventilation for the lower levels. On the 1650-ft level the introduction of a current of air has greatly slackened the rock on the sides and top of the drift, making it necessary to entirely retimber 140 feet of the drift during the week. While this was being done a new track has been laid, and switches, along with the usual connected drift, have been put in. These preliminary parts of the work that must be accomplished before the regular hoisting of ore can be begun. A new pump is being put in the O. & C. shaft below the 1650-ft level, preparatory to continuing the sinking. The flow of water is still strong at the bottom of the shaft.

JULIA.—The main south drift on the 1650-ft level is steadily advancing, the face in a fine character of quartz and sand. The grade of the ore is of a fine, white, well-proportioned character, and assays from \$15 to \$25 per ton. Its value is steadily increasing as the drift advances to the southward, and strong faith is entertained that the concentration of the ledge going south will yet afford a big paying body of ore. There is ample room for such a development, and its discovery would be no surprise to those familiar with the very favorable prospects of that portion of the mine.

ORION.—Daily yield, 25 tons of ore. The ore breasts on the 1450-ft level are showing a decided improvement. The character of the ore is much better, and the assay value is steadily on the increase. On the 1305-ft level a cross-cut has been run to the eastward at a point about 150 feet north of the California line. The full size of this drift was not known until the cross-cut was made, when it was found to open out in a large paying body. This discovery is entirely east of all the old workings on the other levels and points to an undoubted tendency of the ore vein, much farther to the eastward on the lower levels, than has ever been predicted by the most astute of our mining experts. The new pumps will be in place ready to run down to the 1600-ft level in a day or two more, when prospecting will be resumed.

OVERMAN.—Sinking the north winze on the ore body is going steadily forward, the bottom still in very favorable ledge matter, carrying some very rich streaks of ore. This winze is inclined with the dip of the ledge, and is being sunk directly on the foot-wall of the ledge, the upper side cutting into the vein and the lower side on the foot-wall. The water heretofore met with in the bottom of the winze has disappeared.

LADY WASHINGTON.—East cross-cut No. 1 from the main northwest drift on the 850-ft level has penetrated a distance of 120 feet, the face still in quartz and ledge matter of a very favorable character. There is now a considerable flow of water from the face of this drift.

SIERRA NEVADA.—The north and south prospecting drifts on the 1700-ft level are both showing favorable prospects. The quartz in the face of the south drift is increasing in both value and quality. Chas. Bonnemort, for a long time foreman of the mine, has been appointed Superintendent in place of W. T. Wright, deceased. Mr. Bonnemort was formerly foreman of the Savage mine, and is one of the best miners on the Comstock lode.

BATTORE AND AMERICAN FLAT.—The northeast drift on the 1400-ft level is making good headway, the face in better character of ledge material, and will soon tap the water in that portion of the vein so as to permit of the resumption of work in the bottom of the north winze below the 1650-ft level.

HALE & NORCROSS.—The repairs to the main incline, made necessary by the cave just below the 1900-ft station, are about completed, and it is confidently expected that the progress, running in continuation with the Savage will lower the water at a much more rapid rate than they ever have done in the past. The pressure of the water is gradually decreasing.

NEW YORK.—Raising the third or pump compartment of the shaft is progressing as usual, rather slow, owing to the hardness of the rock.

SILVER HILL.—Sinking the main incline is making excellent progress. The flow of water is still strong, but is now handled by the pumps. The northwest drift on the 44-ft level has been connected with the Justice, which will greatly improve the ventilation of the mine to that depth.

BULLION.—The face of the north drift on the 1500-ft level is showing more favorable prospects than it has for a week past. The east drift on the 1600-ft level, where the flow of water is recently tapped, is being again steadily advanced. The flow of water is gradually decreasing, and the evidences are that the main ledge will be shortly reached.

TROJAN.—At the 300-ft level the north winze is down 90 feet, all the way in splendid ore. The north winze, 200 feet further north, is 80 feet deep in \$32 ore, and further sinking is suspended in order to concentrate work in sinking the shaft.

IMPERIAL COX.—The north drift on the 2135-ft level has penetrated to within a few feet of the north or Alpha line. The main drift, connecting the north and south winzes on that level is being enlarged, timbered and tracks laid preparatory to a permanent cross-cutting and development of the ledge on that level.

TRUMAN.—Daily yield, 365 tons of ore, keeping the mills all running up to their full capacities. The ore stops on the 600, 700 and 800-ft levels all looking well and yielding fine. The ore vein on the 1,000-ft level is proving much richer in gold than on the levels above.

CHOLLAR-POTOSI.—Sinking the Combination shaft is making the best of progress. There is no water at the bottom to trouble.

NORTH CON. VIRGINIA.—The main shaft is now 40 feet below the 1,200-ft level. The flow of water at the bottom is easily handled.

HOMESTEAD.—Some very fine seams of quartz, giving good assays, are being passed through in sinking the shaft. The quartz bears a strong resemblance to the red ore of the old upper workings of the Chollar mine. Steam hoisting works can be brought into requisition as soon as reaching the surface grading is all ready.

PROSPECT.—Only eight feet has been added to the length of the main west drift at the 400-ft level during the past week, owing to the hardness of the rock.

DAYTON.—The east cross-cut from the north drift on the 220-ft level is being pushed rapidly forward to prospect the ore vein at that point. The ledge is gradually on the bottom of the drift is gradually on the decrease.

CALEDONIA.—The north drift on the 1400-ft level is being driven steadily forward to open up the ore vein in that portion of the mine.

LADY BRYAN.—The new powerful pumping machinery is all in place, ready to start up at any moment. The new hoisting engines have been shipped from San Francisco and will be in the ground in a few days. The appearances are that this valuable mine is soon to have a thorough and complete prospecting to a depth that must surely prove its value.

SUCCOR.—Sinking the shaft is making splendid progress, the bottom still in a mixture of quartz, clay and ledge material. The flow of water gives no trouble. The rapid development of the deep levels of the mine is now an assured fact, at no very distant day.

YELLOW JACKET.—The new shaft is down 560 feet, the bottom in good working ground. There is but little if any change in the flow of water at the bottom.

SOUTH OPHIR.—Work in the shaft, which for some time has been temporarily suspended, has been again resumed,

Notes on Straw-burning.

We gave a few months ago some notes concerning the comparative heating power of straw and other fuels. Our data was taken chiefly from results gained by experiment at the Vienna exposition. We have now an interesting review of the same subject in a pamphlet on portable steam engines, written by John Head, an English engineer. He shows what will be interesting to all our users of straw-burning engines, and that is the comparative cost of straw and coal in several different countries. We quote as follows:

"There is some difficulty in ascertaining the exact amount of straw or other vegetable substances consumed per horse power by a high pressure engine, from the fact that vegetable substances, like straw, vary much in their calorific properties; but a number of experiments have demonstrated that from 3.25 pounds to 3.75 pounds of average dry wheat straw will evaporate the same amount of water in the same time as one pound of good coal in the most modern boiler. The amount of straw grown per acre varies very much, but in England the average may be taken at about 30 cwt. per acre for wheat straw, or say 3,300 pounds per acre, and is worth to the farmer, on an average, about 30s per ton on the estate. Consequently the value of produce per acre would be about 44s. Then, if we take the value of one ton of coal, at the farm in England at about 20s, and admit the proportion of 3.50 pounds of straw to one pound of coal, we shall arrive at the following conclusion: 3,300 pounds of straw, costing about 44s, equals 943 pounds of coal, costing about 8s 6d.

"From this comparison we find that the commercial value of straw in proportion to coal is about as one is to five; that is to say, it will cost in England five times more money to use straw in our steam boilers than coal. It will thus be evident that it is quite impossible to use straw to advantage as fuel for agricultural operations in England, and generally in the western and northern countries of Europe.

"But the above calculation shows an entirely different aspect when applied to the cost of fuel in all the large corn-growing districts of Russia and the East, India, South America and some of the colonies where the minimum cost of coal delivered at the farm is at least from £3 to £4 per ton, and where straw may be said to be worthless, or of merely nominal value. This arises from the fact that the large farmers in these districts cultivate such enormous areas of cereal crops that they have always an immense quantity of straw which remains, after harvesting the crops, over and above what they require for manure and their farm-yard. If we turn to the comparative calculations of the cost of fuel in Russia, Hungary and the Danubian Principalities, and we take coal at the minimum price of 60 shillings per ton and straw at five shillings per ton (which is generally much above its real value), and admit the same proportion as in the previous calculation, viz., that 3.50 pounds of straw are equal in their calorific effect to one pound of coal, and also that the product of an acre in these countries is the same as it is in England (although in reality it is somewhat less), we arrive at the following comparison between the produce of an acre of straw and its equivalent weight in coal: 3,300 pounds of straw, costing about seven shillings, are equal to 943 pounds of coal, costing 25s. 6d.

"These figures therefore show that the commercial value of straw in proportion to coal, when used as fuel in Russia and the East, India, South America, etc., is as one is to 3.6; or that it costs more than three and a half times as much to use coal in steam boilers as straw."

The figures for California, which we wish we had accurately, would doubtless show a result a little less than that given for Russia, Hungary, etc. Although our straw is only of nominal value, and therefore might enter at the same rate as Russian into the calculation, we can put coal into the field a little cheaper than \$15 to \$20 a ton, which is the rate in those countries. But the point remains that our straw is better and our coal poorer than that sold to the Russians. This would do something to place our straw at the same high rate of value as a fuel as that in Russia and Hungary. Have any of our manufacturers or users of straw-burning engines made any experiments which will throw light on these points? If so, we should be glad to have a report of them.

NEW PROCESS.—The Nevada Transcript thus speaks of a new enterprise about to be inaugurated at Nevada City: Messrs. J. G. Mitchell and Prof. A. B. Crosby, of Philadelphia, have arrived in this city, and propose to erect works for reducing sulphureted ore by a new method discovered and patented by Mr. Crosby. Mr. Mitchell was President of a bank in Philadelphia, and is a representative of large capital, which he stands ready to invest in mining enterprises in this country. They will put up their works at their own expense, and propose to demonstrate to miners that they can reduce their ores and secure a very large percentage of the precious metals therefrom. They have no rights to sell, but intend simply to work the ores either on commission or to buy them from owners. If their method operates as they feel confident it will, they propose to erect a number of works in this vicinity. As we are not familiar with their process, we are unable to express any opinion or give any particulars, until the thing is in operation.

California Sunflower.

The accompanying sketch exhibits the true characteristic features of the California sunflower (*Helianthus Californicus*) as found in this vicinity. The outline drawing was made by Dr. A. Kellogg, of San Francisco, directly from a growing specimen brought from the other side of the bay of San Francisco by Mr. Dunn of Oakland.

This sunflower has mostly a simple stem—although in very rich open situations we believe it is sometimes seen with spreading branches. It usually grows to about four to eight feet in height, with a loose open top of golden flowers, radiant as little suns, blooming late in September and October. Dr. Kellogg writes of this plant as follows:

To us, few flowers have such an honest, candid, open-hearted, good old home-like countenance as the sunflower. We never see one without wishing to press it to our bosom—and we always stop to admire it and do homage to its virtues.

We have observed this class of plants for

ready to dismiss the subject without investigating for themselves, would do well to consider, that with regard to this plant, it is one of the most remarkably absorbing and exhaling properties. The perspiration of the sunflower is 17 times greater than the human body, and its exhalations are peculiarly balsamic and healing in mucous irritations.

This plant appears to be an intermediate form between *H. Californicus* (D. C.) and *H. Californicus* (Nutt.) which are distinct species in T. & Gray's Flora. In Nuttall's description, his plant has leaves "narrowly lance-linear," or "four to six inches long" and only "two to five lines wide," *H. Nuttallii* of T. & G.

In De Candolle's description the leaves are "entire"—ours, it will be observed, are slightly serrate—the cup scales of the flower (*involucre*) are spoken of as "rigid" and a "little longer than the disk," and "not ciliate," in which respect it also differs. Notwithstanding these discrepancies, we believe this is the plant alluded to—at least with facilities here offered the scientific reader will be better enabled to form an opinion.

Technical description: Stem smooth, leaves

THE CALIFORNIA SUNFLOWER.

more than 20 years past, with a view to ascertain whether they were justly entitled to their reputation for preventing the effects of malaria, and rendering the atmosphere around them more salubrious. During many years' residence in Georgia and Alabama we had better opportunities for this kind of observation than since our residence in the comparatively healthy climate of California. But we were then, as we are now, persuaded there is much truth in the observation.

Doubtless if we studied the higher and more useful laws that govern the great ocean of atmospheric fluid in which we live, with as much care and skill as the keeper of an aquarium does his reservoirs, we should find it equally as easy to understand and avoid any ill-balanced culture, and thus be able to supply the needed natural compensating vegetable life exactly suited to purify the air by absorbing injurious exhalations and effete accumulations consequent upon stagnation and excess; and also counteracting their baleful influences by balsamic and ethereal exhalations in such abundance as to supply the brain and nervous system with its appropriate pabulum and consequent vital force—sufficient at least to counteract the temporary tendency and preserve a general state of healthy equilibrium.

The time is drawing nigh, we would fain hope, when we shall need the physician less, because we are more willing to search out and submit to the divine laws of Nature. Those who may be skeptical on these points, and too

broadly-lanceolate, entire or crenate-serrate, strongly triplinerved toward the base, feather veined, tapering into a short winged petiole, ciliate, apex elongated, acuminate, slightly scabrous. Branch leaves mostly opposite. Involucral scales ovate, ciliate, three-nerved at the base, apex attenuate, long-linear, squarrose two or three times the length of disk, unequal. Rays 14—pappus of two broadly subulate awns, achenia smooth and shining, anthers of disk florets dark brown or black, florets nerved, five toothed, scabrous externally. Chaff of receptacle acute, entire, short, villous above.

ENGLISH VS. AMERICAN HARDWARE.—An English hardware agent, who has been trying to drum up trade in Canada, sends to the Manchester Guardian a few doleful lines, which may please Americans in the trade: "I have just returned from a trip into the lower provinces. I find that the whole country is overrun by American travelers soliciting orders for their manufactures at almost any price to secure a sale. I feel sure in my own mind that a very large proportion of the hardware trade is altogether lost to England. For instance, of Birmingham and Wolverhampton wares they have secured many of the leading lines—namely, door locks, mortise locks, chest and till locks, cupboard locks, butts and hinges, carriage bolts, gas and boiler tubes, scales, and, to a great extent, hollow wares. From all I can learn, they are in a position to retain the hold they have got."

Movement for a Botanic Garden.

The idea of a public botanic garden is not a new one to our readers. It has been advanced by our correspondents and has lately engaged the attention of our Legislature. The law makers did not favor it, and without arguing whether they were right or wrong, we express an opinion that a matter of this kind is a very graceful subject for private enterprise and investment if our rich men have the disposition to make it thus. This, we learn, they have, and we are informed that there is a reasonable prospect that a botanical garden will be established.

We find the prospectus of the enterprise in the *California Horticulturist*. The following things are proposed: To collect and cultivate specimens of trees, shrubs and plants of every kind, whether useful or ornamental, that can be adapted to our soil and climate, and to arrange them at a botanical garden in such manner as to make it a desirable place of public resort, as well as study; it being the intention to supply to scientific and educational establishments specimens of plants free of charge, for subjects of botanical lessons and lectures. With the garden it is proposed to connect a nursery and seed farm, etc., for the raising and cultivation of various products which are certain to yield a large profit, not only amply sufficient to cover the expenses of the garden, but also to make an excellent return to the stockholders.

For this purpose it is proposed to purchase the establishment now known as the Exotic Gardens, on Mission street, opposite Woodward's Gardens, with all the stock, buildings, improvements, good will and lease of land unexpired, (nine years). The location of the Exotic Gardens is most favorable for the enterprise, and the business itself is so far established that the actual profits from rent, the sale of plants, seeds and other products, place it in a paying condition. The enterprise, however, does not represent sufficient capital to carry out all the requirements. The most suitable locality for the Botanic Garden is in Alameda county, in the immediate vicinity of the railroad, so that the Garden might be easily reached, and the products be shipped without inconvenience to any part of the State. The amount of capital required for the purchase of the Exotic Gardens, with all the stock and improvements belonging thereto; the purchase of the necessary land in Alameda county and for the improvements on the land; for the laying out and planting the Botanic Gardens, and for carrying out all the propositions above mentioned, will not exceed \$130,000. For this purpose it is the intention to form an incorporated company with a capital of \$250,000, divided into 2,500 unassessable shares of \$100.

A large list of our prominent citizens is printed as commendatory of the enterprise. So far as we can see it is a praiseworthy enterprise. We hardly look for much success to the business departments which are proposed, nor should we expect any very large dividends to stockholders. If the other features were successfully developed we rather think the rich patrons of the enterprise would be fully compensated by the thought of having done a good thing for the public. Our money makers have wider resources from which to draw dividends than seed pods and flower pots. They will be content to have the institution self-sustaining and to look elsewhere for dividends.

LIKE OLD TIMES.—The Chinese of Evans's bar, says the Trinity Journal, have built a large double-bearing water wheel to furnish water for their mine at that place. We believe this to be the only wheel now in the county. The sight of it carried us back to the days of 1860-61, when the river was lined with works of this character, there being one or more at almost every bar where there was not a natural water privilege. Some of the wheels of that day were marvels of workmanship, costing thousands of dollars. But the great flood of the last-named year sounded the knell of wheel-building. Not one was left on the whole length of the river, and the angry waters had so changed the face of the different bars that in many cases claims which had in the fall been valued at thousands of dollars were soon abandoned. The river channel was filled up and changed, the bars covered over with sand and gravel; the dams swept out never to be replaced. From that time to the present there has been but three or four wheels built where there was formerly a score or more constantly running. But the sight of an old-fashioned water-wheel puts us forcibly in mind of the palmy days of river mining before the flood.

LIBERALITY OF MINERS.—On many occasions we have witnessed the liberality of our Grass Valley miners. They bestow their help, when called upon in worthy cases, without making a blow or a show of their charity. The other day a case occurred up at the Empire mine, on pay day. A miner had lost both his eyes, some two or three months ago, in the Nevada City mining district. Word reached the Empire boys that the blind miner was in need of help, and as each one was paid off he dropped into the hat of the disabled man a portion of the pay. The sum contributed by the workmen of the Empire, on that occasion, was \$145. The Empire is not only the oldest mine in the district, and steady and good in her yield, but she has the best miners in the world working down under the ground.—Grass Valley Union.

Palmyra District.

The Gold Hill News says: We have been shown some good rock from the Auroramine, in Palmyra district, some eight or ten miles the other side of Carson river from Dayton. The ledge is situated just in the eastern outskirts of the defunct town of Como, and is one of the strongest in its mineral indications of any ledge in the district. It is fully 60 feet wide, and shows free gold and silver in combination with lead and antimony, also copper. Like other ledges in the old district, if it were nearer the Comstock its true merits would have been brought out long ago; but it may have its day yet. People are beginning to look more after these old locations in the outside districts than they used to, and Palmyra district is among the most promising. There was a time in the early history of Washoe, when the well-defined and good assaying quartz ledges of that district created quite a sensation, and Como was a flourishing town. It may be again yet. Within the space of five or six miles square, or in diameter, are included a large number of very promising ledges, as for instance those known as the Montgomery, Montezuma, Altamonte, Goliah, Wagram, Monte Cristo, Buckeye, Rappahannock, Rapidan, Orizaba, etc. All of these show good ore at the surface, and no explorations have been made deeper than 200 feet. Lack of capital and means starved out the miners of that district, and Como is one of the mushroom towns of the early time. Parties in Dayton, Gold Hill and Silver City are organizing at the present time, determined to give those ledges a more thorough test during the coming season, and Palmyra district may come out all right yet.

PREHISTORIC MINING.—In a paper read before the New York Academy of Sciences by A. A. Julien, on prehistoric remains in western North Carolina, a minute delineation was made of an extensive series of ancient excavations extending from Mitchell county southward into Georgia. These cuttings were evidently executed for the purpose of mining for mica and steatite—an industry still actively prosecuted in the region. The coarse granite strata containing the mica are divided into soft and hard bands, which have influenced the character of the mining both in prehistoric and present times. The ancient workings have been discovered in the soil veins, and consist of two classes. In one deep shafts have been found, sometimes containing tools; and these are ascribed to the Spaniards or to still later adventurers. The other class consists of open excavations, occasionally connected with small tunnels; and these are pronounced undoubtedly of prehistoric origin. Ashes have been discovered in some of the mines, showing the use of fire, as in the tunnels of Lake Superior mines. From appearances it is judged that vast quantities of mica have been taken out in prehistoric times; and it is considered that in these mines the source has been discovered of the mica plates extensively used in tombs of the Mound Builders of the Mississippi valley.

EXPLORATION OF VANCOUVER ISLAND.—Says the Victoria Colonist of the 9th on the exploration of Vancouver island: Captain Devereux, of the West Coast exploring party, arrived in town yesterday. The party left here three months ago to explore for gold and other materials. They went first to Barclay sound, and found indications of marble and any amount of limestone. At Euculet they made no discoveries. From Euculet they went to Clayoquot sound; found nothing there in coal or gold that would pay to work. At Hesquoit they saw Father Brabant and his assistant in good health; both are very popular with the Indians. The party next visited Nootka sound, ascending Gold river a distance of 26 miles, but found nothing beyond the "color" of gold. There are favorable looking bars, and the party was there during very low water and had excellent opportunities of prospecting, which they did thoroughly. From Gold river they went to Mowichet to look for coal, which the Indians said abounded there, but it turned out to be black sandstone. About six miles below Mowichet, a vein of very fine white marble was discovered. The party then returned to Barclay sound, and the party, except Captain Devereux, went on to Alberni, where they will remain and give the upper end of the sound and the streams that flow into it a thorough prospecting.

WELL BORING BY STEAM.—The Ventura Free Press says: Messrs. Adams, Thayer and Edwards have got their engine in working order, and are now boring an oil well by steam. The expense is very much less than is incurred in boring by hand, as the fuel costs nothing and fewer men are required to do the work. Steam is made by using the heavy oil as fuel. The intention of the firm is to bore deep enough to ascertain whether a reservoir of oil exists below or whether it can only be obtained in small quantities as now found in the shallow wells.

LOCOMOTIVE ENGINEERS.—The Brotherhood of Engineers was formed 13 years ago. It now embraces 180 subdivisions and 12,000 regular members in all parts of the United States and Canada. It provides for the widows and children of dead brethren, and since its organization has expended more than \$1,000,000 in this work, besides donating \$50,000 to aid needy members. Only locomotive engineers are eligible for membership, and at a death the family receives \$3,009 cash.

USEFUL INFORMATION.

How to Select a Saw.

Messrs. Henry Diston & Sons, of Philadelphia, lately issued a pamphlet which contains the following practical suggestions respecting the selection of a saw: "In selecting a saw get one with a name on it which has some reputation. If a man desires to purchase a first-class watch he selects a maker who has attained a reputation. This remark applies with equal force in the choice of a saw. The first point to be observed in the selection of a hand-saw is to see that it 'hangs' right. Grasp it by the handle and hold it in position for working. Then try if the handle fits the hand properly. These are points of great importance. A handle ought to be symmetrical and as handsome as a beautiful picture. Many handles are made out of green wood; they soon shrink and become loose, the screws standing above the wood. An unseasoned handle is liable to warp and throw the saw out of true. The next thing in order is to try the blade by springing it. Then see that it bends regular and even from point to butt in proportion as the width of the saw varies. If the blade be too heavy in comparison to the teeth, the saw will never give satisfaction, because it will require twice the labor to use it. The thinner you can get a stiff saw the better. It makes less kerf and takes less muscle to drive it. A narrow true saw is better than a wide true saw; there is less danger of dragging or creating friction. You will get a smaller portion of saw-blade, but you will save \$100 worth of muscle and manual labor before the saw is worn out. Always try a saw before you buy it. See that it is well set and sharpened, and has a good crowning breast; place it at a distance from you, and get a proper light to strike on it, and you can see if there be any imperfection in grinding or hammering. We set our saws on a stake or small anvil with one blow of a hammer. This is a severe test, and no tooth ought to break afterward in setting, nor will it, if the mechanic adopts the proper method. The saw that is easily filed and set is easily made dull. We have frequent complaints about hard saws, but they are not as hard as we would make them if we dared; and we shall never be able to introduce a harder saw until the mechanic is educated to a more correct method of setting his saw. The principal point is that he tries to get part of the set out of the body of the plate when the whole of the set must be got out of the tooth. As soon as he goes below the root of the tooth to get his set he distorts and strains the saw-plate. This will cause a full tempered cast steel blade to crack, and the saw will eventually break at this point.

Making Tea.

A writer in the New York World says: A grave mistake among the tea-makers of this country is that they make tea too strong, and thereby lose the full tea flavor. Professional tea-tasters who desire the full flavor of the leaf use but a single pinch to a cup of boiling water, in place of the heaping teaspoonful generally employed. In China and Russia, where tea is prepared to perfection, it is made weak, boiling water being poured upon a few leaves, the decoction covered for a few minutes; and the beverage drunk hot and clear.

While it is positively essential to a good cup of tea that the leaves be steeped in water boiling at the time it is poured over them (not simply at a boiling point), tea should never be boiled, or the true aroma which exists in the volatile essential oil will be thrown off by evaporation, leaving as flavoring only the bitter principle of tannic acid extracted by the excessive heat of ebullition. The old idea, that black tea must be boiled, not steeped, was long ago abandoned by professional tea-makers and tea-tasters, experience having taught that the leaves require the same preparation as those of the green kinds to produce the most desirable drink. A lump of loaf-sugar put into the teapot with the tea will cause it to infuse in one-half the time otherwise required. When fresh tea is desired, always empty out the soaked leaves of a previous drawing, and rinse the teapot thoroughly with boiling water before a second quantity is put in to steep.

CLARIFIED HONEY.—Clarified honey is obtained by E. Dannenberg, of unexceptionable quality, by diluting the crude honey with half its weight of water, boiling for 15 or 30 minutes, according to the quantity operated upon, the scum being carefully removed, and then adding five or six times sufficient cold water to interrupt the boiling for not over half a minute. After boiling for another 15 minutes, the hot honey is strained and evaporated. Thus prepared the author has kept the honey unaltered for over two years.

PROTECTION FOR SAFES CONTAINING VALUABLES.—In order that ordinary fire-proof safes should be in a measure rendered burglar-proof, the Louis Reuttsch Manufacturing Company, of Meissen, has constructed a wire covering which is placed in an electrical circuit with an alarm bell. If any of the wires forming the cover be cut, which must necessarily happen before the safe can be opened by an intruder, the circuit is broken and the alarm bell is sounded. The device is likewise applicable to doors and windows.

USING COAL.—A writer in the Coal Trade Circular says: Too much coal over the grate bars is a positive waste. Waste steam, blown off under the grate bars (with closed doors to the ash pan) produces astonishing results, cleaning and producing a livelier fire. If all engines were arranged to exhaust under the grate box, much economy would be produced thereby. A water pan under the grate bars, at the bottom of the ash pan, is useful also, and if the reader will put in practice these suggestions, their adaptability will become apparent. It is a fact that but few engineers understand how to burn coal so as to get the best results. It is the greatest amount of calorific produced with the least waste of heat up the chimney in the consumption of coal which is the desideratum, for draft made by the application of waste steam under the grate bars is equal to as much coal as will produce the degree of heat in the exhaust steam. It is strange that the philosophic utility of single organic laws are not more generally diffused among engineers and firemen. On locomotive engines, when the engineer desires a quick fire, steam is turned on under the bars, producing the results demonstrated. A word to the wise is sufficient.

DEFECTIVE APOTHECARIES' WEIGHTS.—The Medical Record recently called attention to the fact that in many cases the weights used by apothecaries in dispensing medicines are exceedingly inaccurate. It is reported that out of four establishments visited, in three of them the weights were found to be either above or below the standard. If such a defect really exists, it is one of vital importance to the pharmacist as well as to the physician, and some steps should at once be taken to rectify such an error.

FILTERING PAPERS.—What is claimed as a new method of folding filtering papers has been recently introduced in Paris. The filter is made from a square piece of paper, folded at first so as to make a crease at each angle. This is done in two folds. While still triangular in shape, it is folded in creases parallel with the edges, and is then opened out, and commencing at one corner, is again folded so that the creases converge, repeating the operation from each corner, the result being a circular filter, with rigid or corrugated sides presenting a larger surface than the ordinary circular filter.

PEANUT OIL.—The supply of peanuts is so great that they may be purchased as low as five cents per pound, and at this price peanut oil can be made at a considerable profit, even taking into consideration the small percentage of oil peanuts yield. African peanuts are said to yield about one-half their weight when cold-pressed, and when heated and pressed, the yield is even greatly increased.

GOOD HEALTH.

How the Young Become Nearsighted.

Dr. Agnew, the famous optician of New York City, has been investigating the causes of the prevalence of a tendency to nearsightedness among young people. He says:

The eye is an organ which is soft, as it were, when the child is born, it is plastic—it is in a condition to be changed in its shape, and its tissues are in a condition to be moved—that is, the tissues which go to make up the organ can be molded in various shapes on pressure. Ordinarily the child goes on until it has reached the age of eight or ten years, or perhaps a little older, when it is observed that it is obliged to hold the object at which it is looking a little nearer than before. An examination reveals the fact that the child is nearsighted. This condition usually progresses more rapidly between the ages of 10 and 26. But we know by means of the ophthalmoscope, and by an examination of the body after death, that the nearsighted eye is changed in shape from the spherical to an elliptical or ovoid form, and that progressive nearsightedness is always marked by a change in the shape of the eye. As the eye is made up of healthy tissue, and it is constantly undergoing waste and repair in use, you readily perceive that the quality of its repair is going to be determined very much by the character of the tissue-building quality of the particular child, and by the way in which that child uses its eyes. Parents at home are very often at fault in not teaching their children how to use their eyes—he had suddenly entered the dwellings of many people, and seen little girls curled up on a sofa, or in a chair, with head down in the lap, the vessels of the forehead turgid with blood, remaining in that situation for a greater or less time; and often, before the child can read, some object, like a doll with its wealth of intricate clothing, or some other plaything, the child holding the object near her eyes—using her accommodation and focalizing its eyes; and all the time waste and repair is going on—because there can be no use of the eye without alterations of tissue, and the child will go blind because the proper nourishment of the eye is interfered with, and the tissues cannot be reproduced as fast as the wasting process. If the child uses the eye for a long time or too closely at any particular form of work, the tissue cannot be reproduced or nourished as it should be; and the pressure of the muscles upon the eyeball and the difficult act of the girl in focalizing, means that the

tissue of the soft and pliable eye is undergoing alteration, which will lead to a lamentable form of the disease. Then the child goes into the school and is there put into forms and classes, and oftentimes is made to do work on slates and copy-books which, perhaps, might be better done on the blackboard, and thus the eye is strained until the mischief is perceived in its effects.

Petroleum for Baldness.

We do not know that any of the prescriptions for inducing a growth of the hair are successful. The latest proposed is petroleum, and as the application can do no harm in any event, we reprint the following from the London Pall Mall Gazette, a trustworthy paper: Persons afflicted with baldness will be glad to hear that a luxuriant growth of hair may be produced by a very simple process described by Consul Stevens in his commercial report of Nicolief for the past year, which has just been issued. In the summer of 1875, Consul Stevens' attention was drawn to several cases of baldness amongst bullocks, cows and oxen, and the loss of manes and tails among horses. A former servant of the consul's, prematurely bald, whose duty it was to trim lamps, had a habit of wiping his petroleum-besmeared hands in the scanty locks which remained to him; and after three months of lamp-trimming experience, his dirty habit procured for him a much finer head of glossy black hair than he ever possessed before in his recollection. Struck by this remarkable occurrence, Colonel Stevens tried the remedy on two retriever spaniels that had become suddenly bald, with wonderful success. His experience, therefore, induced him to suggest it to the owner of several black cattle and horses affected as above stated, and, while it stayed the spread of the disease among animals in the same sheds and stables, it effected a quick and radical cure on the animals attacked. The petroleum should be of the most refined American qualities, rubbed in vigorously and quickly with the palm of the hand, and applied at intervals of three days, six or seven times in all, except in the case of horse's tails and manes, when more applications may be requisite.

A Story with a Moral.

Within a year a ship was undergoing an examination in a dry dock, and at a certain point its bottom, for a few inches square, was found to be not thicker than a piece of paper. On examination, it was ascertained that a small pebble was lodged in the space between the plank which faced the water and that which made the inner floor of the vessel; it had been there for two years, and with every motion of the vessel on its billey home that little pebble also moved, and in its motion wore away some of the timber; too small it may be for detection by an ordinary microscope, but in the course of a year it was enough to wear away an inch of solid timber, and in the second year nearly two inches more, for, with the increase of room which it made for itself, there was an increase of momentum, and consequent wear. Because the captain of that vessel was ignorant of that imprisoned pebble, and because he saw no indication of its destructive influences, they were not the less real, and not the less certain of terrible disaster, but for the fortunate discovery. Thus it is with human life and health, the breathing of a vitiated atmosphere, whether in close and small rooms or large and close bedrooms, or in family rooms over cellars without ceilings, whose noisome odors rise incessantly, day and night, to the upper portions of the buildings—the fumes of decaying vegetables, etc. The breathing of such or other vitiated atmospheres does, by an immutable law of nature, bring injury to the system with the same certainty that gravity will affect a projected feather, or cannon ball or mountain.

NEW REMEDY FOR MALARIOUS FEVERS.—We find in the Chemist and Druggist the following mixture recommended as being not only much cheaper but more efficacious than quinine in malarious fevers: "Chloride of sodium, 12 grammes (185 grains); carbonate of iron, one gramme (15½ grains); mix and divide into three powders. These three doses are to be taken in one day, one powder being taken in the morning, another at mid-day, and the third at night. In order to prevent a relapse, one powder should be given every morning for eight days." As chloride of sodium is nothing more nor less than common table salt, and as the iron salts are generally wholesome, we can certainly recommend the above as simple and harmless and worth a trial.

DISGUISED THE TASTE OF CASTOR OIL.—A modification of the old and favorite mode of administering castor oil in orange juice is offered by Potain. He directs that the juice of half an orange be squeezed into a glass, and after carefully pouring the oil upon this, to add the juice of the other half of the orange so as to inclose the oil. If pains be taken to avoid mixing the layers, the combination can be swallowed, it is said, without the least perception of the flavor of the oil.

AGE.—The probabilities of living to be 100 years old are, according to the statistics of Dr. Farr, 223 to the 1,000,000. That is to say, computing the present average number of deaths on the basis of the recent official tables of mortality in England, out of every 1,000,000 now living, 223 live to be 100 years old, and the last one of the million will die in his 108th year.

sale, J. W. Kiley, S. F.; Wedding Presents, National Art
Co., Cincinnati; Ropp's Easy Calculator.

THE BALDWIN HOTEL.—This elegant new hotel
was formally opened on Monday last. The
building is one of the largest in San Francisco,
and is probably the most elegant in all its ap-
pointments. The structure fronts on three
streets, the principal front being on Market
street. The lower story is occupied by stores, the
central portion by the theater and the remain-
der is devoted to the purposes of the hotel.
The theater is, without doubt, the handsomest
and most beautifully ornamented one in the city,
and it is questionable if there is anywhere else
another one to equal it in these respects. The
hotel itself is furnished in the most magnificent
style, no expense having been spared by the en-
terprising and wealthy proprietor. The furni-
ture, carpets, curtains, mirrors, etc., are of the
finest kind; the latter alone costing as much
money as would furnish an ordinary hotel.
Everything is arranged in a tasteful manner,
and in such a way as to be both comfortable
and useful. In fact, the appointments of this
hotel are more like those chosen for the private
residence of a millionaire than for the purposes
to which they are applied. The undertaking
has cost an immense amount of money and
warrants a more thorough description than we
have space to give this week, so we may take
occasion to return to the subject again.

ANTHONY J. OJEDA, the engineer who was so
badly injured last week at the Pacific Gold and
Silver Refinery, has had to have his left arm
amputated, as gangrene set in. He is now do-
ing well.

THE Miner's Protective Association have se-
lected Shell Mound Park, on the Berkeley line
of the Oakland railroad, as the site of their an-
nual picnic, which is to take place on April 1st.

Miners' Wages.

The agitation on the question of the reduction
of miners' wages continues, but is not confined
to the one locality, as it was a few weeks ago.
The miners' strike at Smartsville still continues.
The Grass Valley Union of the 6th says that
last Thursday they had a torch-light procession
with music and banners, and they visited Tim-
buctoo, Smartsville and Sucker Flat, in all of
which places they were received with warm
welcome. There was no disorder on the part of
the miners. They express themselves deter-
mined to hold out in their present course, and
that they will not work for less than \$3 a day.

We see also, by the Mariposa Gazette, that
quite a number of miners quit work at the Hite
mine on account of a decrease in wages. The
wages heretofore paid to miners was \$55 per
month and board, which, we understand, has
been reduced to \$50 per month and board.

The Bingham canyon, Utah, miners are ex-
cited over an impending notice of reduction of
wages. The Salt Lake Tribune says: We are not
informed whether any general reduction of wages
is resolved upon by the mine-owners of Bingham,
but in the event of reduced pay, our cor-
respondent informs us the miners have deter-
mined upon a course. As soon as the spring
opens, rather than submit to what they regard
as unjust, and arbitrary exaction, all the com-
petent workmen will leave their employ. Two
objects will impel them to this course. First,
to retaliate on their employers, by reducing them
to the employment of low-priced and in-
efficient hands, which they believe will result
in loss to the mine-owners; and to better their
own condition by leasing undeveloped mines,
and thus becoming employers of their own
labor. "It will be a poor lease indeed," says
our correspondent, "that will not pay day's
wages;" and in the cheerful picture he draws
every striking miner in Bingham will be profit-
ably employed upon his own enterprise, the
mine-owners dissatisfied with their low-priced
help, and begging their former hands to return
at full wages, while the unspeakable happiness
will be afforded these latter of refusing the so-
licitation of their former employers and show-
ing to the world an example of the triumph of
honest industry over the tyranny and injustice
of soulless capital.

Spider Lines.

At the meeting of the Academy of Sciences
on Monday night, Professor Davidson stated
that when collecting tarantulas last season on
Mount Diablo, he discovered that one of them,
whilst walking, was discharging a web. With
a frame which he uses for collecting fine spider
lines for micrometers, he commenced winding
up the web, merely as a specimen for examina-
tion; in doing so quite rapidly he drew the web
much more rapidly than it would be discharged
by the spider naturally. A light breath of wind
showed by the reflected light from the web that
he was drawing it so fast that it exhibited itself
as composed of many lines, which were united
and exhibited as one when the line was drawn
out more slowly. By a little dextrous handling
he was enabled to spread the lines from the dif-
ferent spinnerets, upon the bars of the frame,
and, upon subsequently counting them, ascer-
tained that there were not less than 23.

Professor Davidson presented also some speci-
mens of small spiders, the webs of which are
familiar to all, in being present on freshly-plowed
ground. The largest are about the size of a
grain of wheat, but the majority of them con-
siderably smaller. When the collector of these
specimens, Mr. Kuehnle, was watching and ex-
perimenting with them, one little black fellow,
which he had upon a stick, threw out his fine
lines in several directions without reaching any
object, but in one of his efforts the line touched
the ground and upon the instant the spider went
over it with lightning rapidity. Upon another
occasion, when sitting upon his plow-handle,
watching one of these spiders throwing its line
to different points unsuccessfully, it finally
threw one to the rim of his hat and then
instantly mounted the web.

Academy of Sciences.

The regular meeting of the California Acad-
emy of Sciences was held on Monday evening.
John C. Mallory and Wm. B. Hyde were elected
resident members. Dr. James Blake donated
a large number of minerals to the museum,
among them forty-eight specimens representing
the strata passed through in the Suto tunnel.
A number of other donations were received.

Professor Davidson, of the U. S. Coast Sur-
vey, read a continuation of his articles on irri-
gation.

A paper by Henry Edwards, a continuation
of his series on "Pacific Coast Lepidoptera,"
was submitted by title.

The President read a letter from a correspon-
dent on the subject of the production of rain
by human agency. He also read a note on the
question of rain-storms following great battles.
This subject is more fully referred to in another
column of this issue.

President Davidson also read notes on "The
Spider Line of the Tarantula," and "Spiders
throwing their Webs," which we give elsewhere.

Production of Rain by Human Agency.

Ever since it became the impression that the
winter of 1876-77 in California, was to be what
is known as a "dry" one, there has been more or
less discussion on the subject of the production
of rain by human agency; many persons believ-
ing that by exploding large quantities of pow-
der the rain could be made to fall, through
some unexplained meteorological conditions.
This theory has many firm advocates, and the
idea was somewhat strengthened by the fact
that a bounteous rainfall occurred immediately
after the heavy cannonading which took place
during the celebration of the Fourth of July in
this city. This confirmed many in the belief,
as rain at that season of the year in California
was considered very unusual. The subject has
been pretty thoroughly discussed in the interior
press, and numbers are desirous of trying the
experiment. Among these believers in the
theory is one who writes a letter from Placer
county to the President of the Academy of
Sciences, asking the Academy to secure the use
of "Uncle Sam's" guns here to test the theory
in the interests of science.

He says, as is generally known, that our last
Fourth of July celebration was unusually pro-
longed for three days, and was followed on the
6th of July by a heavy rain all over the State.
Living at Iowa Hill, Placer county, he had good
facilities for observing the peculiarities of the
storm: "The clouds came rolling up in dark,
dense masses, accompanied by a fearful amount
of electrical discharge. It seemed to indicate
its origin in some unusual, unnatural cause, and
the tall pines to-day plainly show the marks of
the lightning. The rain fell for one day and
night, upwards of two inches falling in that
time."

The writer then goes on to say that if this
was the result of the firing, as is generally be-
lieved, the same effect could, of course, again be
produced by the same cause, and suggests an
accurate scientific test of the matter.

In commenting on the letter, Prof. Davidson,
of the United States Coast Survey, President
of the Academy, said that there was a popular
belief that after great battles, when heavy artil-
lery was used, a rain storm necessarily followed.
This belief rests on no foundation of facts what-
ever, and comes down to us from almost pre-
historic times. It is on a par with the predi-
ction of weather changes at the quarterly changes
of the moon's phases, and of the special suppli-
cation for rain in particular localities. "Old
Probabilities" is gradually sapping and under-
mining the popular faith in the lunar influence,
because the daily predictions of the Signal
Service show no relation between the atmos-
pheric storms upon the world's surface and the
ever-changing phases of the moon. But the
former belief will not be so easily and surely
eradicated, because the great battles hardly oc-
cur with sufficient frequency to afford the nu-
merical cases demanded to satisfy the illogical
mind. Even the actual coincidences can be
shown to be not necessarily physical relations of
cause and effect.

The belief referred to has not arisen since the
invention of gunpowder, but is the tradition
of nearly 1,000 generations. Classical readers
will recollect that when the Teutones and Am-
brones, numbering over 100,000 armed warriors
and as many women and children, left their
Germanic homes about 110 B. C., to seek in
Italy a milder climate and more productive
country, the Roman army under Caius Marius,
crossed the Alps to prevent the invasion. A
great battle ensued and 100,000 invaders were
slain or captured; and Plutarch in mentioning
the report that the earth was enriched by the
dead bodies, says:

"It is an observation, also, that extraordinary
rains pretty generally fall after great battles;
whether it be that some divine power thus
washes and cleanses the polluted earth with
showers from above, or that moist and heavy
evaporations steaming forth from the blood and
corruption thicken the air, which naturally is
the subject of alteration from the smallest
causes."

But from the contest there was no immediate
storm of rain and he especially refers to the sub-
sequent winter's rains. Nor was there rain
after the equally great battle fought in the fol-
lowing August by the Romans, under Caius
Marius and Catullus, against the Cimbri, who
had crossed the Alps and were overwhelmed.
The peculiar difference in the ancient and
modern belief will be at once noticed as residing
in the causes which produce the rain. Then
there was no gunpowder, but suggestions of a
divine power or a moist exhalation; now the di-
vine power is overlooked and villainous salt-
peter conjured up.

As far as the instance of the 4th of July firing
here was concerned it is much more probable
that natural causes produced the subsequent
rain than the burning of powder. The weather,
for some time before, had been very hot, and in
a measure, rather peculiar for this climate.
Professor Davidson was, at that time, on
Mount Diablo with the Coast Survey party
and kept a record of the thermometer, etc. In

the morning of the 1st of July the thermometer
was 86°, at 2 P. M., 101°; on the 2d, at same time,
84° and 103°; on the 3d, 86° and 101°; on the
4th, 88° and 101°; on the 5th, 86° and 101°; and
on the 6th, 64° and 78° and 7th, 57° and 64°.

Dr. Henry Gibbons, Sr., who has kept a more
complete meteorological record for over 25
years in this city than almost any one else,
says that there is generally a tendency to rain
about July 4th. The rains in California seem
to have a very peculiarly marked periodicity.
The most marked is probably that which occurs
on or about the 20th of May each year. The
meteorological conditions on the 4th of July
were favorable to a rain. The tendency to rain
showed itself before the firing took place at all.
It followed very hot weather all over the State.
The atmosphere was not only very hot but very
moist. For the first time in the history of the
State sunstroke cases were recorded, especially
in the San Joaquin valley. The only explana-
tion was the very hygrometrical condition of
the air. A tendency to cloud was the natural
result of this accumulation of moisture, which
resulted in rain. The very hot weather seemed
to gradually advance eastward, where, it will be
recalled, it was unusually hot. The heated
wave crossed the Atlantic to Europe where it
was severely felt. According to all this, there-
fore, it seems our rain in July was due to nat-
ural causes, and not the agency of man.

A Queer Fish.

Mr. Throckmorton, one of the Fish Com-
missioners, gave to the California Academy of
Sciences, the other evening, a specimen of fish
caught in the salt marshes in Marin county.
The fish looks like an ordinary "bull-head" or
sucker, and is probably familiar in appearance
to many. Its peculiarity consists in its mode
of life. Some of Mr. Throckmorton's land
beyond Lime point is ordinary salt marsh land,
and he several times observed Chinamen at
work at low tide, with shovels, apparently dig-
ging into the banks of the little creeks. Last
week he went down to see what they were about,
and was surprised to have a Chinaman answer
his question by saying he was "fishing." Fish-
ing with a shovel was a new experience to Mr.
Throckmorton, although he has been for many
years an enthusiastic sportsman.

On examination he found that the bank show-
ed numerous round holes at about the half-tide
mark, and the Chinaman took the shovel,
sliced off some of the bank and hauled several
fish from one of the holes.

The holes are similar to those made by swal-
lows, and are in such a position that the entrance
is under water about half the time. The tide
rises here about six feet, and the mouths of the
holes are about three feet below high water-
mark. They go straight into the bank a short
distance and then turn down, so that when the
tide falls below them they are still filled with
water, although the entrance may be two or
three feet above the water at low tide. They
seem to have more of the habits of an eel than
an ordinary fish, and the skin is also eel-like.
Mr. Throckmorton says the flavor of the meat
is also similar to an eel. The Chinese laborers
gather great quantities of them at low tide.
A fish living in a hole in the ground like a
squirrel is something new here, we believe, nor
do we recollect of their having been found else-
where.

THE ELECTION.—Events have culminated
during the week in the nation's capital, and the
whole country has been wrapt in contem-
plation of them. For the time the consid-
eration of home interests has been merged
in the contemplation of the wider issues.
The result of the prolonged electoral count was
a majority of one vote for Rutherford B. Hayes,
of Ohio, for President, and William A. Wheeler,
of New York, for Vice President. These offi-
cers have been duly sworn in to their respective
trusts, and the country is glad that the issue is
closed and the opportunity for a steady trade
and the revival of industry has arrived. The
American people has possessed itself in noble
calmness while the momentous questions were
being settled by due process of law, and now,
that the end is reached, the country is blessed
with quiet obedience.

MORE DIGGINGS IN THE BLACK HILLS.—A dis-
patch from Deadwood says: Col. A. L. King,
of Chicago, and party have returned from a
prospecting tour. Considerable excitement is
created by their report of new discoveries,
which are said to be in a new river-bed, filled
with cement and rich quartz. Many citizens
have taken the matter in hand, and will make
a thorough test of the ground.

AN association has been formed in Edinburgh
for the purpose of purchasing and slaughtering
cattle and other stock in the United States and
Canada, and for also purchasing farm and dairy
produce to sell in Edinburgh and other parts of
Great Britain.

IN the Senate of the Nevada Legislature the
bill compelling the use of safety cages in mining
shafts 300 feet deep and over, and also the bill
compelling a better mode of egress from mines
were lost.

COLONEL JNO. A. GODFREY, of New York, of
the Associated Pioneers, formerly a resident of
San Francisco, and Consul General at Guaymas,
Mexico, died in New York on the 3d inst.

Ancient Ruins in Colorado and Utah.

In our last issue we gave a brief account of the ruins which exist in southwestern Colorado, with sketches showing the general features of these ruins. Some of those examined by the Hayden survey party were in a very good state of preservation, but the majority were merely piles of debris with a few scattered stones and broken pieces of pottery to show that they were formerly inhabited. The Mesa Verde, or green table land, as the name implies, extends north and south about 20 and east and west about 40 miles. It is of a grayish-yellow cretaceous sandstone, with a very nearly horizontal bedding, so that the escarpment is about equal on all sides, ranging from 600 to 1,000 feet in height. Side canyons penetrate the mesa and ramify it in every direction, always presenting a perpendicular face, so that it is only at very rare intervals that the top can be reached; but once up there excellent grazing can be found, with thick groves of cedar and pine.

Entering the canyon at its upper end the party struck into the old Indian trail which comes over from the head of the Rio Dolores. Grouped along in clusters and singly were indications of former habitations, very nearly obliterated and consisting mostly, in the first four or five miles, of the same mound-like forms noticed in other localities, and accompanied always by the scattered broken pottery. As they progressed down the canyon the same general characteristics held good; the great majority of the ruins consisting of heaps of debris, a central mass, considerably higher and more massive than the surrounding lines of subdivided squares; small buildings not more than eight feet square were often found standing alone apparently; no trace of any other being detected in their immediate neighborhood. They now commenced to note another peculiar feature. Upon the right the long slopes of protruding strata and debris formed promontories, extending out into the canyon. Upon these, and not more than 50 feet above the stream, were found frequent indications of their having been occupied by some sort of works, the foundations of which were in every case circular, with a deep depression in the center and generally occurring in pairs, two side by side, ranging from 10 to 20 feet in diameter. There was no masonry of any kind visible, but thickly strewn all about was any quantity of broken pottery. Above, were indications of habitations in the face of the cliff, but not marked enough to warrant further search.

At those places where the trail ran high up near the more precipitous portion of the bluff, were found remnants of stone walls, inclosing spaces of from five to twelve feet in length, in the cave-like crevices running along the seams. They were pretty well demolished, the stones undressed and imbedded in mortar. In many places little niches or crevices in the rock had been walled up into cupboard-like inclosures about the size of a bushel basket. There is no doubt that ruins exist throughout the entire canon far above and out of the way of ordinary observation. All those that were found by the party were built of the same material as the cliffs themselves, with but few, and then only the smallest, apertures toward the canon; the surface being dressed very smooth and showing no lines of masonry, it was only upon the very closest inspection that the house could be separated from the cliff. Cedar and pines also grow thickly along the ledges upon which they are built, hiding completely anything behind them.

In another part of the canyon, on the high bluff to the right hand, were found some of the most curious and unique little habitations yet seen. While going along under this bluff, fully 1,000 feet in height, and admiring its bold outlines and beautiful coloring, one of the party, sharper-eyed than the rest, descried away up near the top, perfect little houses sandwiched in among the crevices of the horizontal strata of the rock of which the bluff is composed. While Mr. Jackson was busy photographing, two of the party started up to scale the high and inspect this lofty abode. By penetrating a side canyon some little way, a gradual slope was found, that carried them to the summit of the bluff. Now, the trouble was to get down to the houses, and this was accomplished only by crawling along a ledge of about 20 inches in width and not tall enough for more than a creeping position. In momentary peril of life, for the least mistake would precipitate him down the whole of the dizzy height, the adventurous seeker after knowledge crept along the ledge until the broader platform was reached, upon which the most perfect of houses alluded to stands. The ledge ended with the house, which is built out flush with its outer edge. This structure resembles in general features the cliff houses already spoken of. The masonry is as firm and solid as when first constructed, the inside being finished with exceptional care. In width it is about five feet in front, the side wall running back in a semi-circular sweep; in length fifteen and in height seven feet. The only aperture was both door and window, about 20 by 30 inches in diameter. Fig. 7 of our illustration is a design of this aerial habitation as it appeared from below, its uniqueness consisting in its position on the face of the bluff. To the casual observer it would not be noticed once in fifty

times in passing, so similar to the rocks between which it is plastered does it appear from the trail. A short distance above is another building of somewhat ruder construction, but with the corners square and the walls truncated.

Fig. 8 is an example of the tenacity of the mortar used in the construction of these buildings; the view being one of the line of little houses described in our last number. In this case a portion of the ledge upon which the house stands has become separated from the cliff, carrying a portion of one of the buildings with it; and although torn away from the remaining wall, and thrown over at a considerable angle, yet it remains perfectly firm and unshaken.

The party examined a very extensive group of ruins about "Aztec springs," lying out upon the northeastern flank of "el Late," and close upon the divide between the waters of the Mancos and the McElmo. The town about the springs is nearly a square mile in extent, the larger and more enduring building in the center, while all about are scattered and grouped the remnants of smaller structures comprising the suburbs. About four miles from these ruins is

could give them no more attention than merely noting their existence. A few miles further on the party came upon the tower shown in Fig. 9, standing upon the summit of a great square block of sandstone, some 40 feet in height, detached from the bluff back of it. The building upon its summit is square, with apertures upon its two faces, like window, looking east and north and very much ruined, but still standing in some places about 15 feet above the rock upon which it is built. At the base of the rock is a wall running around it, a small portion only remaining, the rest thrown down and covered with the debris from the house above.

Here they crossed the boundary line into Utah, and then, two or three miles further, they came upon a very interesting group. The valley at this place widens out considerably, and in the center stands a solitary butte of dark-red sandstone, upon a perfectly bare and smooth floor of the same, dipping down to the center of the valley at a slight inclination. The butte, a remnant of a former mesa, worn down by time to its present dimensions, is about 100 feet in height and 300 in length. Running about its base, in irregular lines, are remains of walls,

ground plan of the "city," showing its general arrangement. The McElmo, shown in the sketch, sweeps the foot of a rocky sandstone ledge, some 40 or 50 feet in height, upon which is built the highest and best preserved portion of the settlement. Its semi-circular sweep conforms to the ledge, each little house of the outer circle being built close upon its edge. Below the level of these upper houses some 10 or 12 feet, and within the semi-circular sweep, are seven distinctly marked depressions, each separated from the other by rocky debris, the lower or first series probably of small community houses. Upon either flank, and founded upon rocks, are buildings similar in size and in other respects to the large ones on the line above. The stones of which the entire group are built are dressed to nearly uniform size and laid in mortar. A peculiar feature is in the round corners, one at least appearing upon nearly every house. They are turned with considerable care and skill, being true curves solidly bound together.

General News Items.

THE China Mail Subsidy bill was defeated in Congress.

JOEL T. HART, the American sculptor, living at Florence, is dead.

THE rates of interest have been reduced by the Odd Fellows bank to eight per cent. on securities of the first class.

THE Direct United States Cable Company gives notice of a reduction of rates to 25 cents (gold) per word.

THE Senate receded from its amendment proposing an appropriation of \$250,000 for the erection of a National museum building in Washington.

THE Harding paper mills, at Franklin, Ohio, were burned on Thursday night. Loss, \$200,000; insurance, probably light. The mills were the finest of the kind in the country.

THE House concurred in the Senate amendment appropriating \$25,000 to pay the expense of a commission of five skilled entomologists to be appointed by the Secretary of the Interior to report the best practical methods of guarding against invasion by the Rocky Mountain locusts or grasshoppers.

THE reply of the Powers to the Russian circular will be presented next week. The Powers have agreed to acknowledge the meritorious zeal of Russia on behalf of the Christians in Turkey. The reply will be carefully worded to make Russia's retreat from her threatening position easy. It is understood that the Powers will propose that the Porte be granted time for the execution of reforms.

THE London Money Market Review says: The Bank of France has announced that it will hereafter make advances upon bar silver at one per cent. per annum, with a margin of 10% in greenbacks deposited with the bank. This is a return to the custom prevailing before the panic in silver. The effect will be to steady the market, and may be regarded as an indication of faith in the future of silver.

In the month of February the Harbor Commissioners report a total of receipts from wharves of \$34,041.85, and in addition \$8,426 drawn from the harbor improvement fund. The disbursements include \$2,807.04 for urgent repairs, \$2,479.33 for steam dredger, \$8,615 on construction account and \$22,154.98 remitted to the State Treasurer.

PAPER MAKING.—We recently found the market rates for paper ruling very low in the Eastern States. Many mills making ordinary qualities are at a standstill. Those making superior qualities are willing to increase their supplies and make favorable contracts. At Salmon Falls, five miles west of Westfield, Mass., we visited one of the very best mills in this country—and that implies in the world. It is owned by the Jessup & Laffin Paper Co., and the mill in its general details was constructed most thoroughly under the eye of its (now deceased) founder, Mr. Jessup, after nearly a lifetime spent in successful paper making. The Fourdrinier machinery is used in connection with other perfected moving and stationary apparatus. The water supply is ample for a very large business, and from the uniform character of the superior writing and sized blank printing paper issued under its able and experienced superintendent, we are confident that the future of these works will develop more importance than its friends are really yet aware of. Mr. Henry J. Bush, President of the company, informs us that so far, even in these dull times, the demands for their paper have equalled the supply from this new mill.

THE Union has advices from Maricopa Wells, Arizona, that the people at that station fear an attack from the Pima Indians, who are exasperated over the rumor that two Indians lately arrested have been hung by a mob in Phoenix. General Kautz has ordered a detachment of cavalry from McDowell to Maricopa.

THE claim of Orr & Gard, better known as the Dutch company gravel claims, situated in La Porte, Plumas county, have been sold to San Francisco capitalists for \$250,000. Orr & Gard have been sole possessors of this claim since 1852.

THE Central mine, Nevada county, is to have a mill to be run by water power.

ANCIENT RUINS IN COLORADO AND UTAH.

a stream called the McElmo, which flows westwardly into the San Juan, but is for the greater portion of the year but a deep, dry gulch. A short distance above, and upon the top of the mesa, which in this place is only about twenty-five feet above the valley, was found quite a large tower about fifty feet in diameter. Immediately surrounding this tower is a great mass, of which it is the center, of scattered heaps of stone debris, arranged in rectangular order, each little square with a depressed center, suggesting large subdivided buildings similar to the great community-dwellings of the Pueblos and Moquis. This group covers a space of about one hundred yards square; while adjoining it on the mesa is group after group on the same general plan, great central tower and smaller surrounding buildings. They cover the whole length and breadth of the land; and turn which way they would, the members of the party stumbled over the old mounds and into the cellars, as one might call them, of these truly aborigines. The same painted, glazed and ornamented ware of which we have spoken accompanies each settlement, and they were continually picking up new designs and forms.

Starting down the canyon, which gradually deepened as the table-land rose above them, the party found upon each hand very old and faint vestiges of the homes of a forgotten people, but

but whether for defense or habitation would be hard now to determine. At the back of the rock, a view of which is had in Fig. 10, are the remains of two quite considerable walls, one above the other; the lower portion—one corner only of a square building, all traces of the remaining portions having entirely disappeared—seemed to serve as a sort of approach to the larger building above, the top of which came up nearly to the summit of the rock. The stones of which it is built are very uniform in size, angle and finish. The only access to the top of the rock was through the window of this house. On top are some evidences of mason work, covering it from one end to the other. All the irregular gaps and crevices have been walled up, probably to make an even surface. But few of the stones remain in position; in one or two places, three or four courses; all the rest are thrown down and scattered.

While passing the mouth of a side canyon a tall, black-looking tower caught the eye of one of the party, perched upon the very brink of the mesa, overlooking the valley. On reaching this tower they found that it was evidently an outpost or watch-tower guarding the approach to a large settlement upon or beyond the mesa lying above it. The party then struck out for another group of ruins some eight or ten miles further west. Fig. 11 is a sketch of a

DEWEY & CO. American & Foreign Patent Agents

OFFICE, 224 SANSONE STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 224 Sansome St., S. F.

Mining and Scientific Press.

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$1 a year in advance. Sample copies, post paid, 10 cents. As an

ADVERTISING

Medium for the Pacific Coast, it is superior to any other journal for all kinds of mining and hydraulic machinery and other mechanical work, building materials, new manufactures and inventions. Our rates are very reasonable compared with those of other first-class journals.

PROOF, -20 TO 1.

The sales of Webster's Dictionaries throughout the country in 1873 were 20 times as large as the sales of any other Dictionaries. We will send proof of this on application, and such sale still continues.

More than THIRTY THOUSAND copies of Webster's Unabridged have been placed in as many Public Schools in the United States, by State enactments or School Officers.

Webster's Dictionary has been recommended by State Superintendents of Public Instruction in Eastern, Northern, Middle, Southern and Western States, -TWENTYEIGHT in all.

Can you better promote the cause of education and the good of community than by having a copy of Webster's Unabridged in your family, and trying to have a copy in each of your Schools?

Webster now is glorious, it leaves nothing to be desired. [Pres't Raymond, Vassar College. very scholar knows the value of the work.

Believe it to be the most perfect dictionary of the language. [W. H. Prescott, the Historian. Dr. J. G. Holland.

Superior in most respects to any other known to me. [George P. Marsh. the standard authority for printing in this office.

Excels all others in giving and defining scientific terms. [A. J. Clapp, Government Printer. President Hitchcock.

Remarkable compendium of human knowledge. [W. S. Clark, Pres't Agricultural College. ALSO,

Webster's National Pictorial Dictionary,

1,040 Pages Octavo. 600 Engravings. Price, \$5.
Published by G. & C. MERRIAM, Springfield, Mass.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 426 California street, Room 1.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes: Tarred Manila Rope; Hay Rope; Whale Line, etc.

TUBBS & CO.,

611 and 613 Front Street, San Francisco.

French Savings and Loan Society,

411 Bush Street, above Kearny, SAN FRANCISCO.

G. MAHE, Director.

Machinery.

The Gardner Automatic Governor.

MORE THAN TEN THOUSAND NOW IN USE.

EVERY ONE WARRANTED.

SEND FOR DESCRIPTIVE CIRCULAR AND PRICE LIST.

When all others fail, buy a "Gardner." We have all sizes of these celebrated Steam Governors on hand at all times.

BERRY & PLACE,

Selling Agents for the Pacific States,
Cor. Market & Fremont Sts., S. F.

THE O'HARRA

CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at \$6.....	\$12.00
Two firemen at \$4.....	8.00
1,500 lbs of salt at 14c.....	22.50
Wear of shoes and power.....	1.50

Cost for 15 tons.....\$44.00
Cost for one ton.....2.93 1/2

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,
Reno, Nevada.

The Ingersoll Rock Drill

Is Extensively Used in the East and

TAKES THE PLACE OF ALL OTHERS,

Wherever introduced, because it can be run with less power, labor and repairs, and do more work than any other drill in the market. It has but few parts, is easily handled, being light, and has AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to

J. B. REYNOLDS,
426 California Street

MENZO SPRING,

Manufacturer of ARTIFICIAL LIMBS,

Of 166 Tehama street, has removed to No. 9 Geary street; office, room 2, fronting on Market, opposite the head of Third street.

ERICH G. GAERTNER, MINING ENGINEER.

All classes of mining properties reported on, consultations had on reduction of ores of all descriptions, plans for furnaces and reduction works furnished, and the construction of them superintended. Ore tests made at the office.

309 California Street, Rooms 8 and 9.

Continued from page 149.

and will now be pushed ahead with steady vigor.

KNUCKLEBROCK.—The 600-ft level is nearly reached, but owing to the whole body of the ground being so thoroughly saturated with water from the long submergence it all has to be drained, consequently the reduction of the water in the shaft is necessarily somewhat slower than was anticipated.

MINT.—Sinking the shaft for a sump below the 1400-ft station is nearly finished. As soon as this is done, and the 1400-ft station put in shape for rapid work, the cross-cutting and development of the ledge will be in order.

LEVATHAN.—The face of the main drift north at the 600 ft level shows fine streaks of low grade ore. At the next level below—the 650—the drift north from the incline is running in quartz and porphyry, with occasional streaks of low grade ore.

GOULD & CURRY.—The pumps and bobs are being put in place and fitted ready to run, down to the seventh station in the shaft. Below that point they are already completed. The main south drift on the 1700-ft level is being pushed rapidly ahead. Burleigh drills now being used in the face.

SAVAGE.—The pumps are kept steadily at work, and are slowly gaining on the flow of water. The repairs to the 1900-ft level are going steadily forward.

UTAH.—The west drift on the 1150-ft level is being pushed ahead to reach and prospect the ore vein at that point. The pits are being dug for the foundations of a large new air compressor which is to be erected immediately.

MEXICAN.—The north drift on the 1700-ft level is still advancing following the west wall of the ore vein. The face of this drift is in a fine character of ledge matter carrying occasional streaks of ore.

PHIL. SHERIDAN.—The face of the east drift on the 400-ft level, running to cut the ledge, is getting into much softer and more favorable ground. The prospects are that the ledge will soon be reached on that level.

FLORIDA.—A new station has been opened at a depth of 815 feet, and a drift started to cut and prospect the ore vein at that point.

BUCKEYE.—The ore from the slopes on the 350-ft level, north drift, is being assorted before being extracted in order to increase the bullion returns from the crushing of the ore.

ALLEN.—Forty tons of good milling ore per day continue to be the regular yield of this mine. This comes from the 800-ft level. There is plenty of it in sight, and the Western State mill is kept steadily running upon it, giving a good fair profit.

KENTUCK.—Arrangements are now being made to resume work in this good old mine at an early day, either through the Crown Point or Yellow Jacket, or through the old shaft of the mine itself, whichever can be done to the best advantage.

SOUTH COUSROCK.—Very active and efficient work is being done sinking the main shaft deeper. It is now 58 feet below the 300-ft level.

WARD.—Sinking the shaft is being pushed ahead with all the vigor possible, the bottom in very soft, giving ground, which makes the work difficult.

UNION CON.—The quartz in the face of the north drift on the 1300-ft level is looking better as the drift advances.

AMAZON AND GLASSBORO.—The face of the north drift on the 300-ft level is showing about three and a half feet of good ore.

CROWN POINT.—The east drift on the 2000-ft level is steadily advancing toward the ledge, the face in hard blasting rock.

BELCHER.—Sinking the main incline is making excellent progress. The flow of water at the bottom is still quite strong. Sinking the drain shaft is also making good progress.

NORTH CARSON.—The prospects at the 500-ft level continue to be very encouraging and the shaft and machinery are in the best possible condition.

Colorado.

EMPIRE.—Colorado *Miner*, March 3: We understand that prospecting and mining are being vigorously carried on in this locality. Empire has shaken off its lethargy, and the recent strikes have encouraged its inhabitants to manifest some of the energy of the early days. The present year bids fair to do more for this district than have the last four years.

MONTICELLO TUNNEL.—Drifting has been resumed upon a lode cut by this tunnel in Republican mountain, and ore is being produced which mills, first-class, 160 ounces, second-class, 75 ounces silver per ton.

GRIFITH MOUNTAIN.—Messrs. Cree & Tarbell, the fortunate owners of the Pickwick mine, were in town this week, having a run made of the ore they have taken out the past month. The following is the result: \$1,569.30, exclusive of mill charges. This is the result of the work of two men, one month, drifting, no stopping whatever having been done.

SHERMAN MOUNTAIN.—There are four parties of lessees at work on Pay Rock mine, and all are in fair pay, with flattering prospects ahead. The first-class ore runs nearly 400 ounces, and the second-class about 200. In addition to these grades a large amount of concentrating ore is raised. The deeper the mine is worked, the better it looks.

RED ELEPHANT MOUNTAIN.—W. A. Campbell, who is superintending work on Grant mine, informs us that in two weeks two men have taken out twenty tons of ore, which it is believed assures an average run of somewhere in the neighborhood of 800 ounces per ton. This ore was taken out at a depth of 80 feet.

VIRGINIA MOUNTAIN.—The latest strike reported in Clear Creek country is on the Clear Creek lode, located near the head of Virginia canyon. This is near the productive Specie Payment, which has made an excellent record during the past year. The Clarissa is owned by W. H. Bush and P. M. Mixell. Although a depth of only 50 feet has been attained, the level opened at that point shows a splendid vein of ore of the same character as the peerless Hurkell, and maintains a width of from four to five feet. It carries gold, silver and copper, and from 10% to 30% of the latter. The ore is sold at the concentrating works and at the smelting works at Black Hawk. The prices paid vary from \$10 to \$580 per ton, several grades being assorted.

Idaho.

GOLDEN CHARIOT.—Owyhee *Avant*, March 3: The slopes are yielding handsomely and there are several hundred tons of ore at the Chariot and Minnesota awaiting transportation to the mill. The cross-course at the 13th level is being rapidly approached, and all the indications of the existence of a bonanza in the vicinity are quite promising. Work is progressing favorably in the several sections of the mine and everything is looking remarkably well. Preparations for an active campaign continue. A new wire rope has been supplied recently, and the surplus water in the lower levels will be rapidly removed. It is anticipated that the bullion product of the Chariot the coming season will be largely in excess of that of last year. Work is not only being prosecuted vigorously, but all the operations are being conducted with a view to the economy and the fostering of the interests of the company.

Utah.

BRAYNER MINES.—Cor. Salt Lake *Tribune*, March 3: The Wasco mine, in South Camp, can now be considered one of the best producing mines in Star district. The tunnel which was being run to tap the ore body was completed a week ago, and reached the ore 20 feet below the lowest former workings. Here was found a continuous vein, running nearly north and south. There is now uncovered and in sight over \$20,000 worth of ore. The miners, Kemple, Sloan, Edleman and Laners, have commenced shipping their ore to Shuman & Co.'s smelter. Large shipments of ore from the Horn silver mine, the Mammoth, Elephant, Vicksburg, and a number of others, are giving a lively appearance to things around the Shuman smelter. A rich discovery has been made in North Camp, Star district. It is called the Crossus, and is owned by H. W. Donaldson. The assays are 7,000 ounces silver and

30% lead per ton. There is more ore in Star district than the people north have any idea of, and in one year from to-day we will prove it by shipments of bullion. Williams & Latey's smelter at Millford is receiving ores from everywhere as fast as Mormon teams can haul them in. About the first of March all the smelters will start up, then look out for large shipments of bullion from Beaver county. The owners of the Frisco smelter have purchased a new engine and boiler and are now having it put in place ready to run again.

Oregon.

THE MUD SPRINGS.—Dallas *Tribune*, March 1: Everybody knows that there are contradictory reports relative to these springs; some to the effect that they are very rich, and some that they are worthless and a humbug. Within a day or two past we have received information which, to us, incredulous as we have been in regard to them, is almost conclusive proof that they are no humbug, and that they will yet prove to be the richest silver mines ever discovered. It is now quite well ascertained that the silver mud comes from quartz deposits some distance below the surface.

PATENTS AND INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING FEBRUARY 27TH, 1877.
187,830. QUILTING ATTACHMENT FOR SEWING MACHINES.—J. Douglass, La Grange, Cal.
187,846. SPRING BED-BOTTOM.—R. M. Gruwell and C. Newhouse, Stockton, Cal.
187,904. MACHINE FOR RE-SAWING LUMBER.—Samuel Putnam, Emigrant Gap, Cal.
187,912. CURRY COMB.—J. W. Rundle, S. F.
187,931. VALVE GEAR FOR STEAM ENGINES.—J. C. H. Stut, S. F.
187,947. VALVE GEAR FOR STEAM ENGINES.—S. H. Wheeler, S. F.

N. B.—By a new arrangement with the Patent Office we shall be able to give the numbers of the patents hereafter.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco.
GOVERNOR CONS. M. Co.—March 2d. Location: Nevada. Capital stock, \$10,000,000. Directors—Martin White, William H. Gwiley, R. C. Clement, Lytleton Price and W. B. Clement.

PACIFIC TELEGRAPH Co.—March 2d. Capital stock, \$200,000. Object: The construction of 786 miles of telegraph line in Nevada, Idaho and Oregon. Directors—M. L. McDonald, M. J. McDonald, J. M. McDonald, E. J. Baldwin and R. H. Minister. The route of the line is to be as follows: From Winnemucca, Humboldt county, Nevada, to Camp McDermott; thence to Summit, Baker county, Oregon; thence to Silver City, Owyhee county, Idaho, with a branch line from Silver City to Fairview, and from Silver City to South Mountain; the main line continuing from Silver City to Boise City, Ada county; thence to Baker City; thence to Walla Walla, Washington Territory; and thence westerly to Portland, Oregon, together with a short line to Portland.

HIMLOCK CONS. S. M. Co.—March 7th. Capital stock, \$10,000,000. Directors—B. F. Fish, Wm. Whalen, J. J. Dolan, T. G. McLeran and S. E. Holcombe.

And in accordance with law and an order of the Board of Directors, made on the second day of January, 1877, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, Room No. 6, No. 420 California street, San Francisco, California, on Monday, the nineteenth day of March, A. D. 1877, at the hour of two o'clock, P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JAMES M. HAVEN, Secretary.
Office, Room No. 6, No. 420 California street, San Francisco, California.

Dolores Consolidated Mining Company.

Location of principal place of business, San Francisco, Cal. Location of works, Dolores Mining District, Esmeralda County, Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 17th day of February, A. D. 1877, an assessment, No. 1, of 10 cents per share, was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 418 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 26th day of March, A. D. 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 16th day of April, A. D. 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Secretary.
Office, Room No. 2, 418 California street, San Francisco, California.

PATENT AGENTS.

Office—224 Sansome St., San Francisco.

PATENTS obtained promptly; Caveats filed expeditiously; Patent re-issues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons, and our success and business are constantly increasing.

The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the most illustrious and widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

DEWEY & CO., Patent Solicitors.
San Francisco, 1877.

ARITHMETIC MADE EASY.

ROPP'S

EASY CALCULATOR

Is a new publication that must prove of incalculable benefit to Farmers, Mechanics and Business Men. It is so rapid and original as to startle the most scholarly, and yet so simple and practical that the most illiterate in figures can instantaneously become his own accountant. It enables thousands to accomplish in a minute what they could not learn to calculate in many months.

The first part contains an entirely new system of tables, which show at a glance the exact value of all kinds of Grain, Stock, Hay, Coal, Lumber, Merchandise, etc., from one pound up to a car load, and for any price that the market is likely to reach; the interest on any sum for any time at 6, 7, 8 and 10 per cent.; correct measurement of all kinds of Lumber, Saw Logs, Cisterns, Tanks, Granaries, Bins, Wagon Beds, Corn Cribbs; a Time, Wages and many other valuable tables.

The second part is a practical arithmetic, and embodies a simple mathematical principle which enables any one familiar with the fundamental rules to become a lightning calculator; and by which over two-thirds of the figures and labor required by the ordinary methods, and fractions with their intricacies, are entirely avoided.

The work is nicely printed on fine tinted paper, is well and elegantly bound in pocket-book shape and is accompanied by a Silicate Slate, Memorandum and Pocket for papers. It is by far the most complete, comprehensive and convenient pocket manual ever published.

Price, bound in Fine English Cloth, \$1.00.

Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter, or receipted by express. Address

A Grand Premium Gift PRESENTED TO EVERY PATRON OF THIS JOURNAL, Consisting of the Largest and Most Sumptuous Work of Art ever issued in Europe or America, entitled THE WEDDING FEAST AT CANA.

This magnificent Steel Engraving has just been issued by the National Art Co., Cincinnati, Ohio, in a superb Premium Edition, and is the finest and most expensive work of art ever issued in America. When its extraordinary size, and the elaborate and skillful labor that has been put upon it, combined with its perfection of printing, are considered, it stands to-day at the head of fine art publications, either in Europe or America. In size it is more than three feet long, by nearly two feet wide—one of the largest pure line steel engravings ever produced. There are more than

SIXTY FIGURES REPRESENTED

and the principal one of the group portrays the most perfectly lovely female form and face, in the person of the beautiful bride, surrounded by her attendants, that the imagination can conceive. It commemorates the Scriptural event (St. John, chapter ii,) wherein the Lord turned water into wine, and made joyous the scene of marriage festivity at Cana, in Galilee. The surroundings of the picture embrace over five hundred special objects, each one of which is finished with the utmost care and faithfulness. We repeat, no such work was ever before issued, and the very few artist's proofs struck off brought \$50 per copy. It is, by all odds, the largest and best premium ever offered. Arrangements have been made, under which the National Art Co. will supply every patron of this paper with a perfect copy of this splendid masterpiece as a grand Premium Gift for 1877.

Subscribers are therefore requested to cut out the following Subscription Coupon and send it to the National Art Co., 206 & 208 Vine St., Cincinnati, O., to be redeemed by that Company. Enclose in your letter 25 cents, to pay for packing, tubing, and express charges on the engraving. If you have no express office, it will be sent by mail, enclosed in a firm, strong tube, and all charges prepaid.

Cut Out this Coupon. It secures you a work of art worth \$20.

SUBSCRIPTION COUPON. On receipt of this Coupon, together with 25c. to pay express or mailing charges, we will send the Steel Engraving, size 22x37 inches, entitled

THE WEDDING FEAST AT CANA,

to any subscriber of this paper. We guarantee every Engraving shall reach its destination in perfect condition, and all charges fully prepaid.

[Signed]

NATIONAL ART CO., 206 & 208 Vine St., Cincinnati, O.

NOTICE. No one but a regular subscriber of this paper is entitled to this Premium Engraving, and all orders must be accompanied by the above coupon. No copy will be sent without it, except on receipt of \$20, the retail price. Address all letters to the National Art Co., 206 & 208 Vine St., Cincinnati, Ohio.

PICKERING ENGINE GOVERNOR.

VALLEJO FOUNDRY, October 17th, 1876.

Messrs. NEYLAN & YOUNG, San Francisco,
Agents for "PICKERING GOVERNORS."

Gents:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this
year for my patent Straw Burning Threshing Engines give splendid satisfaction. They
far surpass for regularity of speed any Governor that I have ever seen, and I have
seen all the best kinds; I have seen the main belt fly off the pulley several times this season
while threshing, and the engineer did not discover it, so perfectly was the speed main-
tained, until he was told of it; this I consider something wonderful; I consider the Gov-
ernor absolutely perfect, so far as speed is concerned. I bought and put on to one of
my engines a Shive Governor, to see which was the best, and after one season's trial I
have no hesitation in saying they are superior to any other Governor that I have seen or
used. I wish you would send me the lowest price that you can furnish 25 Governors for
next season's engines.
Yours respectfully,
J. L. HEALD.

The only Governor that has received awards at each of the International Exhibitions.

TULLOCH'S AUTOMATIC ORE FEEDER,

Awarded the Centennial Medal.

The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of the parties testifying to those herewith given, will establish their value and genuineness:

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone \$48 a day. Mr. Green, of the Phoenix mill (12), Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Stripes companies, Plumas county, writes: From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage them; the saving in both labor and castings is fully one-half over the old style of feeding by hand. Mr. Preston writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

PATENTED CAST STEEL SHOES AND DIES.

Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of iron from which our Steel is manufactured, and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at twelve cents per pound, delivered at San Francisco or Sacramento, instead of sixteen cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc., etc.

Address all orders, with dimensions or drawings, to

CAST STEEL SHOE & DIE CO.,

59 Nevada Block, S. F.

THE ASBESTOS PATENT FIBER COMPANY,

TWO MEDALS OF HONOR.

TWO CERTIFICATES OF THE HIGHEST MERIT.

Of Philadelphia, offer for sale through their agent in San Francisco,

Asbestos Steam Packing, Asbestos Boards and Asbestos Steam Joints,

All manufactured from the pure utilized Asbestos Patent Fiber, and under patents granted to J. S. Rosenthal. The packing is in all sizes from one-quarter to three inches in diameter, round, and free from all grit or mineral matter. The non-utilized or crude Asbestos, manufactured by some parties into packing, is impure and gritty, liable to injure the piston rod and should not be used. The packing made under the Rosenthal

patents is of pure utilized Asbestos fiber, and a very superior article and entirely different from the so-called Asbestos packing heretofore offered for sale. It is compact in form, will not fuzz or disintegrate, and will wear much longer than any other kind of packing. The indestructible, expanding, contracting and lubricating qualities of Asbestos are now universally recognized, and packing made from it is peculiarly adapted for steam engines and pumps.

ASBESTOS PATENT FIBER BOARD.

This is the champion non-conductor, to prevent radiation of heat and condensation of steam, as covering for marine, stationary, or locomotive boilers and pipes, and for lining wood-work, where exposed to great heat. It is light, flexible, is not disturbed by vibration, and will not char or crumble. The sheets are 30 by 44 inches, of any desired thickness, and are easily applied.

ASBESTOS PATENT FIBER STEAM JOINTS.

Indestructible by fire or water, expands and contracts in a desirable manner, adjusts itself to any rough point, is cheaper than rubber, and in all respects a superior article. PURE ASBESTOS FIBER for packing steam governors and other purposes. All these goods are extensively used in the Atlantic States and give general satisfaction.

PHILIP HINKLE,

Ferris & Miles' Lathes, Planes and Machinists' Tools.

Ferris & Miles'
Steam Hammers.

Knowles' Steam Pump; for all purposes where Pumping is required.

Bacon's Hoisting Engine.

Especially adapted to use in Mines, Hotels, Factories, Quarries, and Steamships, with Bacon's Safety Stop.

Office of Amazon and Glasgow Mining Co.,

San Francisco, Nov. 25, 1876.

A. L. Fish & Co., Agents for Knowles' Patent Steam Pump,
Gents: After using many devices for pumping mines I must say the DOUBLE ACTING PLUNGER MINING PUMP (Knowles' Patent), bought some time since for the Amazon and Glasgow mines, is seemingly as near perfection as it is possible to be. We carry steam 500 feet to the pump, raising water 400 feet, which it does easily with 40 pounds of steam, without the slightest jar on the pipes, and is perfectly noiseless. Gravel cannot wear the cylinder, and it is by far the simplest, cheapest and most economical way I know of for draining mines. I would cheerfully recommend them. Yours truly,

A. Caldwell, Superintendent.

Thorne & DeHaven Drill.

Union Rock Drill.

We offer this as the least complicated and most practicable Rock Drill yet introduced.

Agents for the NEW YORK BELTING AND PACKING CO.'S RUBBER TEST HOSE, expressly for Fire Engine use; manufactured by the oldest and most responsible manufactory in this country. This is the Original Carbolized Hose in which the fiber is carbolized, assertions by any defunct agent to the contrary notwithstanding.

Mechanical Ore Concentration and Separation—No 26

[Written for the Press by FRANCIS M. F. CAZIN, M. E.,
Santa Fe, New Mexico.]

Apparatus for Slime Separation.

In a thin, evenly distributed stream of water, an evenly distributed coat of pulp on an inclined plane will be so affected that the coarser particles, protruding higher into the stream of water, will be moved quicker than the finer particles, and the difference in the speed will be materially augmented if the finer particles by heavier weight adhere closer to the plane. The local separation between particles so described can be still further promoted by imparting to the inclined plane a concussion in a direction rectangular or reverse to the direction of the stream of water, because the heavier particles will thereby be made to become stationary or to recede, but the lighter parts will by such concussion be influenced less or not at all in their progress down the incline with the stream of water.

The above explains the principles on which all apparatus for slime separation are based which treat ores classified by the second mode described. I am well aware that although in accordance as far as principles are concerned with the highest authority on these matters (Ritter von Rittinger), I have preferred to depart entirely from his method of representing them, and I believe thereby to lose nothing in theory, but to be more intelligible to American minds. I also differ herein from Mr. G. Kuestel's mode of representation.

Before describing such apparatus as are in successful use for the purpose specified, I may state that none deserves a general preference. The proper selection depends upon the nature of the ore and its pulp more than on the general preference to be accorded to any of the apparatus. Pulp from ore of crystalline nature or pulp from crushers and rollers will show a different action than pulp from amorphous ore or stamps and pulverizers. The former will consist of particles with sharp edges and corners, and the other of globular particles. Although all apparatus to be described are arranged to accommodate the nature of the ore, one may operate with greater success than another under certain circumstances. I arrange the different apparatus so as to represent the different actions on which they are based:

1. The greater adhesion of smaller and heavier parts than coarser and lighter ones to an inclined plane, under the influence of a light and evenly distributed stream of water.

2. The retarding action of a concussion in its direction on heavier ore particles in motion on an inclined plane under an evenly distributed light stream of water.

3. The combination of the two actions before specified.

These apparatus are, the convex revolving table and the plashen-hearth, the Rittinger double concussion table, and Frue's slime table.

The Convex Revolving Table.

With this apparatus as with all others for the same purpose, it is important,

First, that the pulp be evenly distributed in a thin coat and of a proper consistency.

Second, that the stream of water be a very light one.

Third, that the inclination of the table be the correct one and no other.

The convex revolving table, unlike the Cornish buddle, has no sweepers, but their place is taken by a fine rain, distributed and distributable on the hearth, and forming the medium to wash down the different materials. At *a* is the water supply for the distributor, *c*; *b* is the pulp supply, and *d*, *d* are the rain sweepers; *e*, *e* is the circular gutter having partitions and different outlets, receiving waste and concentrated material. The woodcut is after a photograph of the apparatus.

SEVENTY miners were discharged from the Eureka Consolidated mine last week. This is the result of litigation.

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective superintendents on file at the offices in this city.

The Superintendent of the Cosmopolitan has quit prospecting and is chiefly engaged with a few men in taking out ore.

The last six days' clean-up of the Eureka (G. V.) mine was 395 ounces of amalgam. In the last end of the stopes the ledge has come in larger and with a fair quality of rock.

At the Ward work is being rapidly advanced. The road-bed for the side track is nearly completed. The diamond drill was in 100 feet on the east drift of the Gould & Curry, when they were obliged to abandon it on account of having struck a heavy body of water. The pressure was so great and the water so hot that it was impossible for a man to live in the face of the drift. The drill has been removed and the hole

The Martin White mining company shipped 70 tons of bullion on the 5th, valued at \$42,000. This bullion was from the Paymaster and De-fiance mines, in the Ward district, and is the first under the new process of reduction. The company claim that with present facilities they can turn out from \$275,000 to \$300,000 per month.

Testing Roasted Ore.

C. H. A. sends us the following description of an apparatus for testing roasted ore:

The sample of ore to be tested is placed on the filter in the funnel, *A* (see engraving), and the inverted flask, *B*, containing the leaching solution, usually sodium hyposulphite, is suspended over it in such a manner that the longer glass tube, *C*, nearly touches the surface of the ore, represented by the dotted line, *e*. Air enters the inverted flask through the shorter glass tube, *D*, and allows the solution to flow

CONVEX REVOLVING TABLE.

plugged, as they are not prepared to handle any water on the 1700-ft level at present.

The air in the 500-ft level of the Hussey is getting bad. They expect to begin milling ore from the mine in about six weeks.

The following encouraging letter is from the Superintendent of the Alps mine, Ely district: The prospect at the mine is quite encouraging—the Corbus stope in the lower part of the old works is opening up very favorably, and considerable \$100 ore can be taken therefrom; the winze southeast to cut the same vein is looking remarkably well; we have cut through several feeders and ore of excellent quality is coming in on the bottom. The west end of the new development in the Hale lode is looking better than it was at last advice. The streak in the east end, however, has left us. I have great faith in the Alps mine and believe that the 300-ft level could be made to show up a mine could work be prosecuted upon it. Both mills are now running, the Pioche mill running 12 hours each day on custom ore, and the Condor 24 hours on tailings; the tailings have not worked up quite to our expectations until yesterday, when we had results which will make a success of it.

They took little ore out of the California last week on account of being busy with repairs.

The ore producing sections of the Justice, commencing 45 feet above main track floor of the 400-ft level, are looking exceedingly well; from that point to the topmost floor the average width of the vein is fully 12 feet; the ore is also extending in height, showing a strong and well defined vein.

through *C* on to the ore in the filter, till its surface, rising to the dotted line, *f*, closes the air tube, when the flow ceases.

As soon as the surface of the fluid in the filter falls so much below *f* that the weight of the column in *C* preponderates sufficiently over that in *D*, the flow is re-established, and so the leaching proceeds without trouble to the operator, who only has to test the filtrate occasionally to know when the operation is finished.

This apparatus works very nicely, and the fluid flows through the tube with just enough force to stir up the ore on the filter so as to insure the extraction of all soluble silver or other metal. A slight regurgitation of the liquid from the funnel back to the flask, which sometimes happens, is not material.

CERRO BONITO MINES.—Applications were received at the Interior Department two or three years ago from Benjamin Flint and several other Californians, for patents for the Cerro Bonito quicksilver mines, in Fresno county. Pending Departmental action on the applications, Mr. Garraghan filed a protest against them, alleging that the mines are within the exterior boundaries of the Rancho Panoche Grande. The matter thus remained hanging until last week, when Secretary Chandler, as almost the last act of his administration, signed a decision overruling Mr. Garraghan's protest and directing patents to issue forthwith.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from prominent mines have been as follows: Modoc, March 6th, \$5,384.28—total to date, \$10,528.28; Northern Belle, 6th, \$6,500.67; Tybo Con., 6th, \$9,175.35; Northern Belle, March 8th, \$8,608.88; Tybo Con., 5th, \$9,175.35; Grand Prize, 6th, \$8,333; Grand Prize, 12th, \$8,000.

THREE new saw-mills are now building by the North Pacific Coast Railroad Company, between Tyrone and Moscow. This will make five in all, with a capacity of 140,000 feet per day. Mr. Duncan's mills cut 35,000 feet, making a grand total of 175,000 feet per day. These are all to be finished and running by June 1st.

Running Lumber in Flumes.

William H. Thurman, of Borden, Fresno county, has just patented a method of running lumber in flumes, which will be of interest to many of our readers in the mountains. The usual method of running lumber is to place the separate pieces in the flume and allow them to run down by the force of the current, but it is found in practice that the lighter pieces and boards will soon overtake the heavier sticks and partly over-ride them, and in this way several lengths will become jammed in time so as to form a more or less rigid mass, which will become jammed at turns or corners, and this necessitates the employment of a numerous force at long flumes to keep them clear, besides greatly decreasing the capacity of the flume.

In the new method, Mr. Thurman takes any lumber which he may have ready to send down, and piles it up together in lengths, until he has accumulated a bulk suitable to the carrying capacity of the flume. This pile is then secured together in any suitable manner; but the inventor has found a very satisfactory method to be in the employment of a peculiar clamp. This clamp is made of iron of suitable strength, having a body a little longer than the thickness of the pile of lumber to be bound together. The ends are bent so as to extend at right angles with the body and enclose the pile, and these ends have sharpened points bent down. The pile of lumber being made up, the clamps are slipped over the ends, and then the workman takes a piece of wood of a suitable thickness to form a key, and drives it between any of the pieces of the pile. This key forces the pile apart so that the points of the clamps will be firmly secured in the outer boards of the pile and the whole mass will be bound securely together. In order to unite these piles into a gang, pieces of rope are taken and knots made in each end. These knots are placed between the boards of any pile, and when the pile is keyed up the ropes form a loop projecting from the ends of the piles. These loops from the consecutive piles being connected will unite the whole into a gang of any desired length, and these gangs will so fill the flume that they will run down in regular order and never become jammed. It is not necessary in making up the piles to select lumber of any particular size and lengths. Lengths may vary somewhat, it being only necessary to have the outside pieces of the pile the longest.

Another advantage derived from this method is that green heavy lumber that will not float may be moved by putting it into piles with a certain proportion of dry lumber, so that the whole will have sufficient buoyancy to float. Other methods of binding the piles together may be employed, but this inventor has found the clamps and keys best, as by driving the keys out the whole pile is loosened.

These flumes for carrying lumber are some of them of great length, and have varying grades, so that the lumber may run five miles in 12 or 15 minutes, and the next five miles in an hour or more. The flumes are also made of different widths, as at a low incline they must be wider to take all the water from the steeper grades. The great advantages of uniting the lumber into gangs will be readily appreciated. At Mr. Thurman's flume of 51 miles, the lumber runs through in a little over 12 hours, and so regularly that they can always time its arrival within 15 minutes; and where they formerly needed a man to each mile to keep the flume clear, they now have but seven for the whole distance. If they desire to send green lumber that will not float, they simply put it into the gang between enough dry lumber to tow it down.

The practical advantage of this method is very great. In the old way, whenever the lumber is choked in the flume it throws out water, and feeders are necessary at short intervals to keep up the supply. Side flumes must be made so that in a jam the lumber can be switched into these side flumes, from which, after the flume is cleared, it must be thrown bodily into the main flume again. All this is obviated by this method.

A NEW 20-stamp mill is contemplated by the Harrisburg Co. at Silver Reef, Utah.

CORRESPONDENCE.

Mining at Stockton, Jacob City, Etc., Tooele County, Utah.

Stockton is 40 miles west of Salt Lake City, 25 miles of the distance being made by the Utah Western railway, the remainder by Gilmer & Salisbury's stages each daily. As a friend and former pupil, of Paris, Ill., unexpectedly, almost joyfully, met with here, has kindly come to our aid, in the way of notes, and personates us so well, his manuscript is submitted entire with the exception of a few verbal alterations.

My sojourn in Stockton was so limited that I cannot write much concerning it, or its mining interests, which have laid almost dormant for a number of years. The majority of the city belongs to General P. E. Connor, who has a patent for 175 acres of land upon which the city has been built. This gentleman has expended almost a fortune in the development of

The Mines Surrounding Stockton.

And in building furnaces for the reduction of ores—the furnaces proving almost valueless, but the ores are now proving that the General's head was level as to their value.

Among the mines that are now being worked, and with

A Profit to the Owners,

Are the following: The Muscatine, King of Stockton, Continual, Our Fritz, Quandary and Atkins, owned by Atkins & Ostram; the Great Basin, owned by General P. E. Connor; the Iroquois, by P. J. Shoff; the West Extension of Silver King, No. 2, by W. S. Godbe & Co. and the Chicago smelting and mining company. The Legal Tender, Lievnau, Lawrence & Crocker, has paid well, running from 50% to 65% lead and 15 oz. to 20 oz. silver; the Globe, by Lawson & Torneuten; the Madison, by Merwin, Ellis, & Spaulding; the Reno Tunnel, by Thompson & Merwin; the Everlasting, by J. W. Wallace; the Bolivia, by General Connor & James G. Brown; the Katharina, by Alston, Steele & Co.; the Hannah, by Nack & Hoge; the Putnam, by P. L. Shoff; the First National, by Dr. Thompson.

In addition to the above I might enumerate

Over Forty More Claims,

Or prospects, that are down from 50 to 150 feet, which will produce ores, with sampling assays, from 30 oz. to 60 oz. in silver, and from 40% to 75% lead per ton. Upon the whole, from our short visit to Stockton, I must say that I was favorably impressed with the apparent prosperity of its mining interests, and was surprised to find one of my old pupils to be the sole owner of

The Iroquois and Putnam,

Two of the best claims in the district. From what I could learn from reliable sources, the Iroquois has been a paying mine from the jump and the Putnam yields \$60 per ton, but as it is so high up in the mountain, friend Shoff seldom visits it, as he is getting as corpulent as an alderman from the good living he gets at the Eureka hotel, Wm. Willoughby, proprietor. But I must now bid farewell to Stockton and leave for Dry Canyon, where the lucky lessees, Messrs. Callahan & Co., are taking out ore from the Kearsarge mine, from which choice pieces have assayed \$24,000 per ton, and 80 sacks, sampled, \$5,000 per ton; and 60 sacks, \$8,700 per ton. Before setting out for Jacob City, some further facts were furnished by Mr. P. S. Shoff, more particularly in regard to

The Greatest Depth Attained

On some of the principal mines at Stockton, as follows: West extension, Silver King, 480 feet; Muscatine, incline, 420 feet; Iroquois, incline, 190 feet from face of incline; Legal Tender, 120 feet; Great Basin, 265 feet; and the others from 60 to 150 feet. The deeper the mines are sunk the richer the ore. Climate such that the mines can be worked the whole year round. Snow does not lay long on the ground. Mines all accessible for wagons to go almost to the dumps.

The Hidden Treasure Company's Smelting Works

Are located here for the working of the ores from their mine at Jacob City, distant from 10 to 12 miles. In connection with the furnace a fume saver has been erected, 24 feet high, 17 feet long and nine feet wide, the invention of the manager, Mr. Geo. E. Ayres, the principal object aside from saving the dust being the prevention of lead poisoning or any sickness arising from breathing the impurities of the atmosphere surrounding the works. The principal machinery employed is a revolving screw cylinder, and water, the agent for condensing the fumes. If effectual, as represented, it should, for sanitary reasons alone, be introduced generally by the reduction works.

At Rush Lake, two and one-half miles west of Stockton,

The Chicago Smelting Works

Are running two stacks very successfully (and intend to put up a third), reducing from 60 to 70 tons per day, the ore coming from the King of Stockton and the Queen of the Hills (Dry canyon), both valuable and profitable mines be-

longing to the company. In addition, much custom ore is worked, that averages 35% lead and 30 ounces per ton of silver. The gangue of the King, quartz, from 18% to 20% iron and lead 49%. The gangue of the Queen of the Hills is principally lime, with some carbonate of zinc, fluor spar and steatite or soapstone. It is understood that both mines and works have paid very handsome dividends from the outset, which may be put down almost as one of the exceptional cases among the English companies in Utah. Much may be attributed to the ability and energy of Godbe & Co. and to Mr. Ballard, Superintendent of the works, for the unwonted success of their operations.

The Mines About Jacob City,

Perhaps better known as Dry canyon, in consequence of some recent rich discoveries in the Kearsarge mine in particular, and already alluded to, are at present attracting a good deal of attention. Your correspondent had some curiosity to ascertain by personal examination whether or not the actual facts would be found to correspond with the rumors afloat, or with the published accounts in the *Tribune*, some of which have probably made their appearance in the columns of the *MINING AND SCIENTIFIC PRESS*. To this end a visit was made to

The Ira or Kearsarge,

The property of Messrs. Lilly, Lisenring & Co., of Mauch Chunk, Penn., but at present leased and worked by Messrs. Callahan and Vanskiver. During the year 1874 the sum of \$300,000 was mined from a single chamber, since which more or less good ore has been found from time to time, as the developments proceeded, up to about 18 months ago, when a break occurred and the ore deposit lost. The lessees on sinking perpendicularly from the old incline, which had reached the depth of 480 feet, struck the original pipe of ore, giving assays as above represented, and lowest grade bringing in the market as much as \$730 per ton. Average sample assays for first class run as high as \$10,120 per ton, carrying gold to the amount of \$325. Within less than a month about \$27,000 worth of ore has been mined, and present developments show sufficient ore of similar character to insure each of the lessees a rich harvest for his labor before the expiration of the lease. The character of the ore is principally chloride and sulphide of silver.

The Tessora,

Owned by S. E. Bright, located about 300 feet east of the Kearsarge, and claimed to be on the same vein. An incline of 30 feet lays open some rich ore, carrying horn silver, assaying upwards of \$600 to the ton and represented to be in every respect similar to the bonanza last mentioned.

The Alabama, Balsam and Dry Pine,

The property of an Omaha company, are situated on the same hill. A shaft has been sunk 100 feet and a tunnel run 200 feet, with drifts in each direction along the vein, which varies in width from 12 inches to three feet. Character of ore, carbonate and galena, said to contain from 35% to 60% lead and from \$30 to \$90 silver.

The Deseret Mine,

Owned by Mr. S. Chamberlain, of Cleveland, Ohio, is one of the leading mines of the district, and at present making shipments of from 40 to 60 tons per month of excellent silver ore (chloride and sulphide), represented to run from \$200 to \$500 per ton.

The Mono Mine,

One of the most prominent as well as one of the most promising in the camp, is under the superintendence of Mr. M. T. Gisborn, of Salt Lake, who also holds a half interest, the other half being owned by a gentleman in New York. Incline 650 feet, 12 levels; ore vein from one to four feet, all of which is mined and gives working average of \$400 per ton—two small lots, first class, running as high as \$8,000. Character, horn silver, together with sulphide and bromide and other varieties of silver ore, also some carbonate of lead and galena.

The mine was reopened about a year ago, after being idle for some time, since which it has been thoroughly retimbered as far as the works have advanced and put in good shape for future working. In accordance with statements from the Superintendent the prospect is flattering, the ore improving, that at present depth estimated to be worth probably somewhere from 500 to 800 ounces silver per ton.

The Jenny Lind,

On Forest hill, free milling and high grade ore, different from most of the ores of the district, worth (working test) from \$100 to \$500 per ton; vein near surface from 10 inches to three feet. The Modoc and Faro on the same hill are of the same character. The hill has not been much prospected and is thought by some to be an inviting field for the employment of a little idle capital.

The I X L. On Shoo Fly Hill,

The property of Messrs. Tiernan, Marshall and Royle, is situated immediately below the Ira, and one of the oldest locations on the hill. Work is progressing, and it is said to give every indication of developing into one of the most promising on the hill. The Pocahontas, owned by Mr. J. Tiernan, has a fine large body of ore, between the lime and slate, and is also thought to be promising, being on the same reef as

The Hidden Treasure.

This large and important mine of the district lies on the opposite side of the canyon from the Mono. Incline on vein, 1,000 feet, 8,000 feet

in levels and inclines. Average width of vein, four and a half feet, opening in places to 24 feet of galena and carbonate ores, that need no flux and work about 30 ounces in silver and 45% lead. If selected, first-class would run 50 ounces silver and as high as 70% lead. The yield last year amounted to 12,000 tons, and it is said to be the only mine that has been able to run a furnace solely on its own ores. It is understood to be paying property, and is giving employment to a large body of men. The Fourth of July, in the same neighborhood, has a face of similar ore, averaging \$60 per ton and 50% lead, paying the lessees well. Before entering upon the details of

Mining Operations at Ophir,

Something of the somewhat peculiar geological aspects of the vicinity may not be out of place. The general formation is limestone. The dip of the strata on one hand to the east and on the other to the west, points to some great ancient upheaval, causing at this point a complete and regular curvature in the sedimentary beds, with longitudinal axis north and south.

A large ravine enters the deep canon at Ophir from the north, following the center line of the upheaval, cutting the strata and exposing for a considerable distance the quartzite, and above it the slaty shale of the Lower Silurian, (Salt Lake *Tribune*, January 1st) from the trilobites, spirifers and other fossils found in the shale beds.

A porphyry dyke 150 feet wide and cropping out in places from 11 to 15 feet above the surface in grotesque forms, spires and pillars, extends northeasterly from the vicinity of Ophir for many miles, crossing Dry canyon, and at other points disappearing from sight, its continuance, nevertheless being determined by the different underground explorations on the line of its course, and the cause no doubt of the breaks, faults and other local disturbances of some of the veins in the neighborhood.

Owing to the temporary suspension of some of the best mines at Ophir at the time they were visited, many interesting facts in regard to their operations were not noted. In fact, the same or a similar remark may be made in regard to most of the districts, and generally only a sketch can be given. In no case let it be imagined that an exhaustive report is intended.

On the south side of Ophir hill, from the Hidden Treasure is

The Gray Rock Lode,

A true fissure vein, with four feet between walls, that has been worked to the depth of 300 feet, and a large amount of ore extracted, running high in lead when properly assorted, and probably 30 ounces in silver. The whole of the matter can be used as flux, which adds greatly to its value.

The McCullen has two feet of carbonate ore—medium grade—and the Great Eastern four feet of similar ore.

The Buckhorn

Has large deposits of sulphide of lead and carbonate ore, in some places as much as 30 feet in width, giving 30% lead, and from 20 oz. to 30 oz. in silver, containing some good streaks of ore of a much higher grade.

The Mineral King

(Bliss & Co.), has been worked uninterrupted since last August, during which time 120 tons of ore have been shipped, running from 33% to 37% lead and 35 oz. in silver; average width of ore vein 18 inches, with foot wall of porphyry, and the other of limestone. Greatest depth from surface, 100 feet.

The Giraffe,

Also the property of Bliss & Co., and 200 feet lower on the same hill, has two feet of argentiferous galena, carrying 40% lead, and 60 oz. silver, one shipment to Reno going as high as 69 oz. in silver. A shaft has been sunk 56 feet, and tunnel extended on the vein 128 feet, with the view of making connection with shaft at the depth of 300 feet from surface, requiring a further run of 196 feet: The ore is carried from both mines to ore-house on the road below in a chute, whence it is hauled, without sacking, to the smelting furnaces at Rush Lake.

The Lily Rose

(I. Roland). A fissure vein from six to eight feet between walls, and cropping out on the surface the distance of 600 feet, with 18 inches of good smelting ore, containing 30% iron, 100 tons shipped brought 35 oz. in silver and 32% lead. The Brethel, on Chloride hill, also the property of Mr. I. Roland, has a vein from six to eight inches of chloride ore, running upwards of \$100 in silver. The Roland, owned by same, is situated a little below Ophir in the quartzite, and is opened by a tunnel 110 feet, showing three feet of galena, with from 25 to 30 oz. silver, with, perhaps, 40% lead.

The Bonanza,

Lying between the slate and the limestone, has an immense body of low grade ore. Sulphurets of iron are found in considerable bodies, which will probably pay well with proper facilities for reducing this character of ore. The mine is said to have paid fairly and continuously.

The Miners' Delight shipped last year 3,800 tons of ore to the furnaces at Rush Lake, and thousands of tons of low grade ore are at present laid open by the different tunnels and drifts.

The Resuscitator, shaft 100 feet and a level run shows four feet of vein matter between walls—character of ore mostly galena and carbonates, with about \$600 worth on the dump.

The San Joaquin

(H. W. Lawrence), has an incline of 325 feet on

the vein, which varies from 15 inches to three feet. At present there are two feet of very high grade ore, sampling about \$800 per ton in silver (free milling). The mine is paying, but how well was not ascertained, not wishing to pry too far into private business, but probably quite handsomely, judging from the amount and value of the ore.

The Monarch,

On Lyon hill, owned by Messrs. Lawrence & Cliff, and opened by tunnels, shows chambers of chloride and milling ore from 3 to 30 feet in width; first-class sampling from 125 oz. to 250 oz., and second-class from 50 oz. to 60 oz. It is classed among the best paying mines in the district.

In consequence of works suspended on some of the principal mines, and other causes not likely to occur, this camp was unusually dull. It was thought, however, that new life would be infused on the resumption of work, and a prosperous season was anticipated. The surface indications for mineral bearing veins could not be better.

A. C. K.

The "Lieu Lands."

The bill confirming title to California school indemnity selections was signed by the President on March 1st, and became a law. It will have the immediate effect of quieting title to several hundred thousand acres of the most valuable lands in the State, preventing an otherwise incalculable amount of litigation and disturbance of property interests. A dispatch from Washington gives the following account of the passage of the bill. "Notwithstanding their failure to defeat the passage of the bill, the jumpers and their Washington attorneys made desperate efforts to prevent its approval by the President. Eighty of the Los Angeles jumpers telegraphed to the President, earnestly requesting him to veto the bill on the ground that it would deprive them and other honest settlers of homes and other valuable improvements. He therefore referred it to the Interior Department for examination and advice as to whether he should approve it or not, and Judge Widney, who, as the representative of the State titles, has spent nearly a year in procuring the passage of the bill, found himself last week obliged to encounter seven or eight attorneys in a two-days' argument before the Commissioner of the General Land Office on the whole merits of the question.

We append the text of the bill:

SECTION 1. Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the title to the lands certified to the State of California, known as indemnity school selections, which lands were selected in lieu of 16th and 36th sections, lying within Mexican grants, of which grants the final survey had not been made at the date of such selection by said State, is hereby confirmed to said State and its vendees, in lieu of the 16th and 36th sections, for which the selections were made.

SEC. 2. That where indemnity school selections have been made and certified to said State, selection shall fail by reason of the land in lieu of which they were taken not being included within such final survey of a Mexican grant, or are otherwise defective or invalid, the same are hereby confirmed, and the 16th or 36th section in lieu of which the selection was made, shall, upon being excluded from such final survey, be disposed of as other public lands of the United States: Provided, that if there be no such 16th or 36th section, and the land certified therefor shall be held by an innocent purchaser for a valuable consideration, such purchaser shall be allowed to prove such facts before the proper land office, and shall be allowed to purchase the same at \$1.25 per acre, not to exceed 320 acres for any one person: Provided, that if such person shall neglect or refuse, after knowledge of such facts, to furnish such proof and make payment for such land, it shall be subject to the general land laws of the United States.

SEC. 3. That the foregoing confirmation shall not extend to the lands settled upon by any actual settler, claiming the right to enter not exceeding the prescribed legal quantity under the homestead or pre-emption laws: Provided, that such settlement was made in good faith upon lands not occupied by the settlement or improvement of any other person, and prior to the date of certification of said lands to the State of California by the Department of the Interior; and provided further, that the claim of such settler shall be presented to the Register and Receiver of the District Land Office, together with the proper proof of his settlement and residence, within 12 months after the passage of this act, under such rules and regulations as may be established by the Commissioner of the General Land Office.

SEC. 4. This act shall not apply to any mineral lands, nor to any lands in the city and county of San Francisco, nor to any incorporated city or town, nor to any tide, swamp or overflowed lands.

The Engineer says: The first Bessemer rail ever run over by cars was laid down in Derby Station, Eng., early in 1857. It was a double-headed rail, and kept its place for 16 years, though 500 trains daily passed over it during that space of time.

MECHANICAL PROGRESS.

English Patent Law Reforms.

We have alluded before to the agitation which now prevails in England over proposed changes in the patent law. Of one mooted measure, *Iron*, after finding many faults, notes the good points thus: "Some of the wiser and better provisions of the bill are as follows: The reduction in the fees is a most important point, and this concession to the poorer class of inventors should be received with gratitude. Until the new scheme gets to work—if it ever does—it cannot be said whether the benefit will not be illusory, from the additional cost of procedure, in cases where the examiners report adversely and the applicant has to appeal to the Chancellor; but at any rate the reduction is a step in the right direction, and the way in which it is proposed to levy the fees, lightly at first and more heavily afterwards, is a sensible one. Other parts of the bill are also good—the surrender of crown rights over patents, the abolition of the cumbersome procedure of *scire facias* for the revocation of a patent, and the substitution of a simple petition to the Lord Chancellor, the extension of the period of provisional protection to 12 months instead of six, the facilities given for extension of time in case of the accidental omission to apply for a renewal. These and some other minor points are all steps in the right direction; but, after all, they are but small steps, and the question arises whether it is worth while to take so much trouble for so little."

In the same connection we read that a memorial, identical with one some time since presented by the Society of Arts, but now signed by 1,150 persons, more or less interested in Patent Law Reform, has been presented to the Lord Chancellor. It states that under the provisions of the "Patent Law Amendment Act, 1852," the Lord Chancellor, the Master of the Rolls and certain law officers of the crown therein named, together with such other persons as her majesty the Queen should appoint are made Commissioners of Patents, with full powers, as therein specified, to conduct the business of granting letters patent for inventions and to make regulations for the administration of the Patent Office. That up to the present time the provisions of the foregoing act, authorizing the appointment of one or more persons as Commissioners of Patents, in addition to the *ex officio* Commissioners, have not been acted upon, no additional Commissioners, as contemplated by the act, have been appointed, and thus the whole business of the Patent Office falls upon the *ex officio* Commissioners, who are already overburdened with other important and heavy duties. The memorial recommends the appointment of one or more additional Commissioners of Patents, to whom might be entrusted the full carrying out of the duties of the office and who shall be responsible for the same, and that no further legislation be attempted until after such Commissioners have been appointed and the system contemplated by the act administered in its integrity.

An English Straw-Burner.

As the subject of straw-burning engines is of wide interest on this coast we quote from an English paper a description of a contrivance which is used by engine builders in that country. The contrivance described is manufactured by Messrs. Ransomes, Sims & Head, of Ipswich, Eng. The apparatus for feeding the straw, reeds, and other fuel into the fire box consists of two toothed rollers placed at a minimum distance of about one-fourth inch apart, and capable of rising so that the distance between them can be increased to one and one-fourth inches. The under roller is set in motion by means of a strap from the crank shaft of the engine, and makes about 45 revolutions per minute. The upper roller moves at the same speed, and is connected with the under one by means of long toothed wheels. The rollers are carried on a cast-iron frame, to the front of which is attached a trough for holding the supply of vegetable fuel to be fed into the furnace. The rectangular space between the rollers, which serves as a passage for the fuel into the boiler, is placed from four to five inches above the fire bars, this distance having been found by experience to give the best results, as by injecting the fuel at this point the fresh substance forces its way into the center of the burning mass inside the fire box, and ignites more quickly than when it falls on the top of the fire. The theory of the invention is, that by means of a continuous mechanical feed, the fuel can be forced into the furnace in a thin stream in the form of a fan, and the fresh fuel is practically held in suspension for a short time, allowing the separate stalks to become immersed in the flames, and the long pieces of straw, reeds, or brush-wood to have the effect of stirring up the half-burnt material in the furnace, thus keeping the whole in motion, besides permitting a proper ingress of atmospheric air, which is necessary for the rapid combustion of vegetable matter.

THE EXHIBITION OF 1878.—The number of Parisian exhibitors at the international exhibition, to be held at Paris in 1878, exceeds by 2,000 the corresponding number of Parisian exhibitors at the great French show of 1867. The works of construction are proceeding rapidly in the Champ de Mars and the Trocadero.

Mechanical Progress in Germany.

Thirty-six years ago, says Mr. Geo. Thomas, mechanical engineer, there was not a single locomotive or wagon works in the kingdom; but all locomotives were imported from England, save some few from America. At the present time there exists in Berlin, Hanover, Chemnitz, Cassel, Carlsruhe, Esslingen and other towns, extensive locomotive works, which produce together nearly 1,500 locomotives yearly, representing a value of about three million sterling. Borsig, of Berlin, turned out 1,031 locomotives within the six years from April 1st, 1867, to April 1st, 1873, of which 300 were sent to Russia and 30 to Austria, Holland and Java. Without stopping to inquire why those 300 locomotives were sent by one German firm to Russia, etc., and why they commenced successfully to compete with our English makers in Java, we certainly cannot, as a nation of free traders, deny them the right to do so; but at the same time it is not selfish on our part to examine the causes of successful competition. Those engineers and merchants make the best progress who have an ever-watchful eye to such opposition, and we must, in all branches of our industry, always endeavor to keep ahead of our rivals. Borsig has, up to 1875, exceeded the number of 1,700 locomotives. Unfortunately Borsig has cut some of our own locomotive constructors out during the past two years in Sweden, and in a most formidable manner, too, having sold more than fifty locomotives there.

Germany manufactures yearly upwards of 30,000 railway wagons, representing a value of \$4,500,000, many being for export, principally for Russia. In this branch iron has replaced wood to a great extent, and they possess many specialties; for instance, the almost universal use of cast steel instead of iron; of cast steel axles of splendid quality (first made in Carlsruhe); Krupp invented an ingenious process of fixing on cast steel wheel tires, and Meier, of Bochum, casts splendid cast steel disc wheels in one piece.

MECHANICAL NOMENCLATURE.—A mechanic writes to the *Polytechnic* in the following pertinent way: "There is no reason why the name of a tool or a part of an engine or machine should not indicate or to some degree denote the nature or the use of the thing designated. And yet such is far from being the case. Let us take for example the tools by which hexagons or square heads are screwed home. Such a tool for use on a nut is called in England a spanner, because it spans the nut and is open at the end. If it is closed at the end it is called a box spanner. If it is constructed so that one jaw will shift or move, it is called a shifting spanner. If, on the other hand, it has a square hole in it (such as is used for taps), it is called a wrench. In the United States, as applied to a nut, it is called a wrench; as applied to a tap, it is a tap-wrench; and if adjustable, it is termed a monkey-wrench; while a tap-wrench is called a one-ended or a two-ended wrench, according to whether the hole is in the middle of the length or near one end—the English term under those circumstances being a single or double wrench. Why should the device used in small lathes to drive the work be called a dog, when the English term driver, or carrier, is so much more appropriate? Why, on the other hand, should the lower half of an axle box be called a keep instead of a cellar? Why, indeed, should a crank-pin be called a wrist-pin, or a coupling rod a parallel rod? Echo answers "why?"

THE AMERICAN WORKINGMAN.—The American workingman must live in a house, not a hut; he must wear good clothes and eat wholesome and nourishing food. He is an integral of the municipality, the state and the nation, subject to no fetters of class or caste; neither pauper, nor peasant, nor serf, but a free American citizen. He has the ballot, and if it were possible it would be dangerous to degrade him. The country stands pledged to give him education, political power, and a higher form of life than foreign nations accord their laborers, and he must be sustained by higher rates of wages than those of Europe. Our industries, operated by American citizens, must be freed from foreign interference, and organized into a distinct American system, which will exact some temporary sacrifices, but result in general prosperity and true national independence. In maintaining diversified industries we utilize every talent, provide a field for every capacity, and bind together the whole people in mutual dependence and support, assuring strength and security to our Republic.—*Hon. D. J. Morrell.*

ATTENTION TO MACHINERY.—In looking through different manufacturing establishments one cannot fail to notice the difference in the care and attention paid to the use of machinery. In some you will find a mass of patched up belts, looking as though the next revolution of the shaft would tear them asunder; the line shaft rocking to and fro and wabbling around in several of the hangers, reminding you that at any moment some part of it was very likely to give way; some loose pulley on a counter-shaft making such a rattling noise you could scarcely make persons hear you though standing close to them. Thus from one part of the establishment to another you would find everything in a dilapidated condition, causing you to come to the conclusion that there was but little system or business about the proprietors and no prospect of their succeeding in the business, and in fact only injuring the trade of first-class factories by poor work at low rates.—*Mech. Jour.*

SCIENTIFIC PROGRESS.

The Barometer and Mine Explosions.

The European engineers are tracing a connection of much scientific interest, between the falling of the barometer and fire-damp explosions in coal mines. Mr. Zimmerman, a Belgian engineer, holds that "Explosions of fire-damp generally occur simultaneously with a rapid fall of the barometer." Calculations prove also that this coincidence is not merely fortuitous, but that a diminution of atmospheric pressure is, as a rule, the prime cause of calamities of this nature. Taking the daily readings of the barometer for 16 years ending Jan. 4th, 1877, the lowest readings invariably occur in the four winter months—that is, November, December, January and February; and it is worthy of notice that we have had very low readings during the past three months, and several explosions of gas have occurred during the same period, and it may reasonably be concluded that the views of the Belgian engineer are really correct, although we may not have a sufficient collection of statistics to enable us to affirm this positively. The expression, however, that sudden falls of the barometer and reduction of atmospheric pressure are the cause of these explosions is not strictly correct. The cause really is that accumulations of gas have been made in some part of the workings and a sudden change of atmospheric pressure induces or allows those pent up gases to escape out of the working places or roads of the mine. If this occurs, then the exposure of a naked light brings on the catastrophe.

OLD SEA MARGINS.—At the late meeting of the Edinburgh Geological Society, Mr. David Milne Home, read a paper on "Old Sea Margins." He stated that he had been in the custom of taking a note of old sea margins wherever he came across one, and now he had put together the result of his notes during the past 20 years. He considered that it would be taken for granted that the sea had covered this country at different levels. This might be inferred from the fact that sea shells had been found up to the height of 500 feet, and that immense beds of sand and water-worn gravel had been also discovered at great heights, particularly in the Highlands. The horizontal lines formed on the mountain sides also showed old sea levels. On the west coast of Scotland he had seen at about a dozen places a sea margin at the height of 11 feet. On the Firth of Clyde he had noted half a dozen at the same height, and about a dozen on the east coast. A beach 26 feet high and another 40 feet high were seen at about a dozen places on both sides of the country. Old beaches were also observed at the height of 50 feet, 70, and 90, to 100 feet. There were beaches at even vastly greater heights, he himself having seen two lines 1,500 feet high at Glenelg and Lochaber, and one 1,800 feet high at Glenroy. Mr. Ferguson, F. G. S., of Kinmundy, gave his American observation, which similarly proved that high old beach-lines obtained there also.

ASTRONOMICAL NOTES.—Dr. Henry Draper, of this city, says the *New York Independent*, and Mr. Huggins, in England, have been simultaneously at work upon the photography of stellar and planetary spectra. They have both obtained good and very interesting impressions of the spectrum of Vega (a Lyrae), which shows peculiar broad dark bands, quite unlike anything in the solar spectrum. Dr. Draper finds that the spectrum of Venus exhibits at the purple extremity the same sort of weakening in photographic power which is observable in the spectrum of the sun near sunset. On December 28th the observatory at Wilna, in Russia, was burned. The large refractor and photo-heliograph were destroyed and only books and instruments of minor value were saved. The observatory has been of late years doing very valuable work in astronomical physics, especially in the line of solar photography, and its destruction is a serious loss to science.

LIFE ON TITICACA.—Late numbers of the *Bulletin* of the Museum of Comparative Zoology of Cambridge give the results of Prof. A. Agassiz and Mr. S. W. Garman's exploration of Lake Titicaca, undertaken during the earlier months of last year. The mammals and birds are elaborated by Mr. J. A. Allen, with Mr. Garman's field notes. None of the ten species of mammals are new; four of them are llamas. Among the birds, of which 69 species were collected, there are several novelties, and would have been more had not various collectors been in the same field a little before and had not their discoveries been promptly published in the English *Ibis* and Cabani's *Journal fuer Ornithologie*. Mr. Walter Faxon elaborates the crustacea, describing and figuring several new species, all, with one exception, belonging to a single amphipodous genus.

WILLOWS AND STREAMS.—Lester Ward, in a very interesting article on local distribution of plants, in the *Popular Science Monthly*, suggests that the willow, the alder, the elm and the sycamore hug the banks of streams because baffled and beaten back at every attempt to invade drier ground. There is no doubt a struggle for supremacy going on in nature, as well as a struggle for life; and yet the one point is in a great measure involved in the other.

FRENCH INVESTIGATIONS OF DUST.—We learn from foreign journals, says the *Journal of Chemistry*, that at the suggestion of the Municipal Administration of Paris, M. Marie Davy is carrying on, at the Meteorological Observatory of Montsouris, a regular study of the dust found in the air, on the ground, or in water, collected in the principal quarters of Paris. These powders will be sent to the observatory and regularly examined by M. Miquel. Some preliminary observations were lately made on the infirmaries connected with the Prince Eugene Barracks, which were recently evacuated with a view to disinfection. On scraping the floor of some of the wards that had been occupied a few days, a dark powder was got, which, put into pure water and under the microscope, showed a multitude of filiform vibrones, with slow undulatory motion, and at the center some vibrating points which changed places rapidly. The frames of some of the windows gave a specially large number. Various algae, bacteria, monads, etc., were met with. While the troops were there, and especially in dry weather, there can be little doubt that these powders would be raised by the tramping of their feet, or by their clothes, and would mix with the respired air, as also with the food and drink. M. Davy indicates some precautions that ought to be taken in barracks in view of these facts.

NEEDS OF A UNIVERSITY.—President Gilman, of Johns Hopkins University, has been speaking of the office and work of a true university. He says that "three by-laws should be passed—that no waste of time should be allowed within its walls, that there should be no disparagement of any branch of learning, and that character is before knowledge. Not what one knows, but what he is, should be the criterion. The first requisite of such a university is brains—a large number of learned teachers, who must also be ready to teach and skilled in teaching. The day is passed when the same teacher can teach everything. Other requisites are choice collections of books, apparatus, etc.; good plans; method and harmony; good working places, as laboratories, etc.; and, last, a good body of enthusiastic students."

NEW FISH.—An ichthyological discovery of the utmost importance has lately been communicated by Prof. W. Peters to the Royal Academy of Science of Berlin. This is a second genus and species of the wonderful order of *Lepidocardi*, or brainless fishes, the so-called invertebrate vertebrates. This order, which some naturalists rank as one of the primary divisions of vertebrata, has hitherto been known to be represented by the single genus *Amphioxus*, which comprehends the various supposed species of lancelets. The new animal is closely related the *Amphioxus*, but wants both caudal and anal fins, and has, instead, a high dorsal fin. The *Epiomethys cutellus*, as the creature is called, was dredged in eight fathoms, near Peale island, Moreton bay, Australia.

INSECT NERVES.—The nervous system of the *Hymenoptera* (bees, wasps, ants, sawflies, etc.) has been studied by E. Brandt. He describes certain pedunculate bodies whose development, as originally discovered by Dujardin, corresponds with the degree of development of the instincts and intelligence in the different species. Brandt's researches now enable him to prove that this is the case also for the different sexes of the same species. Thus in the worker of the honey bee they are of immense size, while they are slightly developed in the queen and in the males.

WEIGHT OF AN ATOM.—On the absolute weight of atoms, a lecture experiment by J. Annanheim, is as follows: Dilute solutions of fuchsin were examined, and it was found that 0.00000002 gram. of the substance can be detected by the naked eye. If we assume that in a drop of the solution there is one molecule of fuchsin, and at least this amount must be present, the weight of an atom of hydrogen would be 0.0000000059 gram. A similar experiment with cyanine gave similar results.

A GASQUAKE.—A Pennsylvania paper says: It is rather a strange freak for the bed of a creek in this part of the country to be heaved up 20 feet, but the story may be true, nevertheless. Twenty feet of the bed of Dunkard creek, Greene county, Pa., near the Wiley oil well, was upheaved a few days ago by an internal convulsion of some kind, supposed to have been caused by gas. At the same time several old and deserted oil wells commenced to flow slightly again.

RAINFALL IN ENGLAND.—E. J. Smith, President of the English Institution of Surveyors, says that measurements are now being made daily at 1,500 stations in the United Kingdom, and at longer intervals at about 300 others. Taking the country generally, July and October might be regarded as the wettest months—July owing to the very large amounts often falling during thunder storms, and October from frequent steady rains; while the least falls in April and May.

UTILIZATION OF FISH BONES AS FERTILIZERS.—German manufacturers are continually engaged in purchasing fish bones, gathered along the Norwegian shores near extensive fish-curing establishments. These are pulverized and converted into fertilizers. It is suggested that arrangements be made for utilizing the bones from the establishments in Newfoundland.—*Manufacturer and Builder.*

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

BUTTE BASIN.—Amador Ledger, March 10: The boring operations at Butte Basin continue to be prosecuted. One hole has been sunk 200 feet, at which depth the augur was in very hard rock. It was concluded not to sink any further in that spot. Another hole has been commenced nearer the basin. No gravel has been struck as yet.

YORK'S GRAVEL CLAIM.—The gravel claim lately owned and operated by York, at Butte City, has recently passed into the hands of Ginochio Bros. and C. D. Horne, who are working it on a far more extensive scale than heretofore. A stream of 500 inches kept playing upon the gravel, washing away the embankment at an astonishing rate.

BECK.—The drift to ascertain the width of the vein is over 40 feet, and the end is not yet. Samples of the rock show specks of fine gold in several places. On Wednesday a splendid streak of quartz was struck in the vein, one or two feet wide, with gold visible through the whole of it.

Mona Mine.—The mineral region near the Mokelumne river, as the result of the development of the Beck claim, continues to attract attention. Parties visit the neighborhood almost daily on the lookout for mines. Captain Beck has secured a large extent of ground on each side of the company. The total amount of ground now under the management of Captain Beck is over 5,000 feet. Other parties are negotiating for the purchase of the Beck claim. The Beck claim of Dryden, is running on ore from the Olive. The owners are anxious to know the result of the crushing, as upon that will depend in a great measure the future operations of the company.

CROWN POINT.—A clean-up was had at this mill last week, which, we are told, yielded a trifling over 80 per ton. This is considered low-grade ore, but nevertheless it leaves a fair margin of profit.

MOXTENA CLAIM.—Tribb & Bellard are still engaged upon their gravel claim at French Hill, realizing a considerable quantity of gold at each clean-up. Occasionally a nugget of coarse gold is washed out. One was obtained last week worth between \$20 and \$30. The drift is now in the main channel of pay dirt, and even better yields may be anticipated in the future.

BUTTE.

BORING.—Orville Mercury, March 9: The artesian well being bored for J. R. Bennett, near Chico, is down some 640 feet. The first 500 feet was bored by contract, and they made from 10 to 40 feet per day; but since that time they have not made more than 10 feet per day, and it is feared that has greatly lessened speed. At the depth of 520 feet they struck lava rock and boulders, which made their progress very slow. The lava rock differs in no respect from that found on the top of Table Mountain; the boulders are the same as are met with in our mining claims. The next met with was sand and soapstone rock, cement and wash gravel. Afterwards came a large body of quicksand.

CALAVERAS.

RICH ROCK.—Calaveras Chronicle, March 10: We have seen some specimens of rock from the Blue Jay mine at Mosquito. The specimens were taken from the mine at the depth of 45 feet, at which point the vein is fully three feet wide and is fairly streaked with gold. Our informant states that from a bucket of unsorted rock they obtained over \$300. The Blue Jay is a fair sample of a majority of the mines in the upper country mining district.

IN LUCK.—J. F. Voith, proprietor of the Excelsior hydraulic on Tunnel ridge, has been particularly fortunate. The Excelsior claim is full of enormous quartz boulders, necessitating a vast amount of labor for their removal. In the work of breaking them to pieces to facilitate operations, Mr. Voith discovered the quartz to be of unexampled richness. One of the finest specimens we have ever seen was the other day shown us by Mr. Voith, bearing large pieces of free gold. The discovery will naturally lead to a careful examination of what have been considered huge incumbrances, but which may prove a prolific source of wealth to the owner of the claim, besides the richness of the gravel. The Excelsior is one of the best claims in the State.

CONTRA COSTA.

CLAYTON QUICKSILVER ORE.—Cor. Contra Costa Gazette, March 10: Some of my rock runs over 11%, some samples 13% and others 20%. The poorest samples 1%. The richest rock is that from the bottom of the tunnel, and it improves in going down, but, on account of water, the vein can only be advantageously worked below the present level, by running another tunnel on a lower one. If such quicksilver mine as this was in some far away situation there would undoubtedly be a great future about it; but, here within three hours' reach of the great Pacific coast metropolis, it scarcely attracts any attention, and there are numerous prospects in the vicinity equally as good. The management has not been judicious, and a good deal of money has been uselessly expended in experimental assays that have not answered expectations, leaving the company embarrassed with an empty treasury and debts; but Mr. Jacob Bendixen has now undertaken to pay off these debts from the products of the mine and the prospect is good that he will be able to do it within a short time.

FRESNO.

NEW IDRIA MINES.—Cor. Hollister Enterprise, March 10: A tunnel runs 1,000 feet into the side of the mountain, which distance steam is conducted to work the engines used in elevating the ore. From this tunnel shafts are sunk to the depth of 350 feet. Two donkey engines hoist the water accumulating in the mine. The men employed here are principally Cornishmen. One mile below this camp is the hacienda, or headquarters. Here are the furnaces, three in number, for smelting the ore, at which none but Chinamen are employed. The average production of quicksilver is about 900 flasks a month, each flask weighing 74 lbs. About 250 men are employed in and about the mines. The total population is between 600 and 700.

INYO.

MINNETTA BELLE MILL.—Coso Mining News, March 10: R. C. Jacobs, Superintendent of the Minnetta Belle mill, is in from the lookout last Monday and informs us that his mill is very near completion. He thinks he will steam up by the 15th and be ready to crush ore by the 20th inst. When this mill starts renewed life will be given to operations of the Minnetta. At present nothing is being done in the mines, as the dumps are all full to overflowing with ore, and to proceed with work it would involve the expense of building additional dumps.

LETT US.—Mr. J. F. Cox, the able Superintendent of the Minnetta Belle mining company went below last Tuesday to tender his resignation. He is compelled to this course on account of his health, which has become greatly impaired by his hard and severe labor, much of it having been self-imposed because of his great anxiety to make the venture a success for his friends.

MARIPOSA.

MARY HARRISON MINE.—Cor. Mariposa Gazette, March 10: This valuable gold-bearing quartz mine is about two miles below the town of Coulterville, and about half a mile from the 36-stake quartz mine, which is run by steam power, all of which belongs to the Maxwell Creek gold mining company. The Mary Harrison mine is producing rock from a vein five or six feet thick, taken from the bottom of a shaft 50 feet deep, averaging from \$15 to \$20 per ton. There are 64 white men and 18 Chinamen employed in and about the mine and mill, besides 10 men engaged in chopping wood and cutting teams. About five cords are consumed and 25 tons of ore crushed every 24 hours. A

clean-up occurs every ten days, resulting in the production of large brick of gold, valued at some thousands of dollars. The mill contains 50 stamps in good working order, 35 in use and 15 standing idle at present. It is contemplated by Mr. Douglas to commence work again on the Potosi mine some time during the coming spring or summer, when all of the stamps will be put in motion. An engine of 80-horse power is sufficient to run the large, heavy spauls, 50 stamps, six pans and all other machinery that attack.

ORE FROM MT. ST. HELENA.—St. Helena Star, March 9: J. C. Bullenger, of Oakville, passed through town Saturday, with samples of gold and silver-bearing ore from a claim, the Comet, owned by himself and son, on the southwest side of Mt. St. Helena, eight miles from Calistoga. Mr. S. and son discovered the claim three years ago, and have since sunk several shafts, run one tunnel and built a house on the claim. They have taken out, from time to time, about 20 tons of ore. They expect to commence work as soon as the weather settles, taking out considerable quantities.

NEVADA.

THE TUNNEL.—Grass Valley Union, March 9: We gave an account of the tunnel which is being driven through the hill. The idea of such an enterprise meets with general approval from the old miners of the district. No doubt but the tunnel will pay well, under proper understanding with owners of quartz ledges, and of course it is known that it would open up a large section of valuable mining ground, which would not have to be pumped. Osborne hill has millions of gold in it, and a tunnel would enable the miners to get at it. The tunnel would be driven straight along, for instance, ought to be continued right straight along, toward the east, cutting Osborne hill ledges at nearly right angles, until a large section of country is drained. A proper survey of the country would show at once the feasibility and the practicability of the tunnel. Mr. John Smith, of the Orleans mine and mill, who knows the section to be drained as well almost as if he had made it, thinks the cost of the tunnel would be very small in comparison to the benefits which would be by it secured.

PROPOSED CHANER IN MINING.—There are a great many of the big hydraulic miners who think that working their mines by drifting will pay them more money than they do by the present way of working. Instead of sending whole mountains of rich soil down to the valleys, the drifting would scarcely muddy the streams. The farmers who would have to be compensated would be very small, as they would be deprived of ground on which they can profitably raise potatoes. The miners, however, have no hostility to the farmers in thinking of adopting the change of method of working their mines. The change would immediately be followed by a cry for more "slickens," instead of the growl at that enrichment which is now heard every day.

DEADWOOD MINE.—We hear some most excellent news from the Deadwood mine, located in Willow valley, above Nevada City. A crushing of about 30 tons of ore has lately been milled, which gave about \$75 to the ton. That kind of a result makes it pretty certain that the mine will come out as it did in the days gone by, when it acquired its name.

PROSPECTING.—Nevada Transcript, March 7: Richards & Currow are prospecting a ledge which was struck while the railroad tunnel was being run a year or more ago. They went 200 feet from the point where the ledge was discovered and commenced to sink a shaft. After getting down 50 feet they struck a ledge one foot in thickness, which shows free gold and sulphurets in liberal quantities, and all the indications are favorable for opening up a good mine, so we are informed.

We are told by Mr. Duncan, Superintendent of the Shultz gravel mine, that the company are getting along well with the prospect incline, and the gravel prospects from three to nine cents per pan. He thinks he has a good thing ahead, and is pushing the work as fast as circumstances will permit.

DUNCAN & BEESINGER are sinking an incline on the hill of Little Deer creek, near Graceland, for the purpose of opening up a bed of gravel supposed to exist there, with a view, if it proves profitable, to erect machinery and drift it out. Mr. Duncan informs us that he has reached the gravel and that it prospects satisfactorily so far, and he is in hopes it will warrant more extensive work.

PLACER.

THE GRAVEL MINES.—Dutch Flat Forum, March 8: The Elmore Hill claim is cleaning up. The Polar Star, Southern Cross and Franklin claims are all off cleaning out the debris from their tunnels, all having the misfortune of being plugged up. It is expected that they will be washing again in a few days. The ditches are all carrying their full capacity of water and everything is now looking prosperous.

THE RHODE ISLAND HILL.—The Rhode Island company still continue to ground sluice, and will resume hydraulic in a short time. Mr. McCann, the principal owner of the Wide West company, called at our office this week, and reports the running of the second tunnel completed to within ten feet of where it will be connected with tunnel No. 1, by means of a side drift 70 feet in length. When this is accomplished, work in both tunnels will be resumed, and prosecuted without interruption, with the exception of making occasional connections for air, until they have advanced the entire length of their mine along the channel a distance of 2,100 feet, when a large force of men will be employed in breasting out the ground toward the mouth of the tunnel the full width of the channel. The bedrock in tunnel No. 2 has decreased to two feet, and the pay incline will have averaged \$12 per day for the men during the last nine days.

LOWELL HILL.—The work of breasting out and washing in the Swamp Angel continues to be prosecuted. They are also extending their main tunnel for prospecting the course of the channel, and also opening up new drifts.

LITTLE YORK.—The Empire company turned off and cleaned up last week, with unusual good results. The blocks have been run, and washing resumed again. Washing at Christmas hill is progressing favorably without interruption.

SHADY ROCK.—The North American company continue to work a large force of men in their drift diggings with good results. The Wild Yankee mine have removed their pipe and giant to another point and are now hydraulic and opening up their mine, commencing where the ground is shallow.

The Liberty Hill company continue running all the water that can be utilized to advantage.

YOU BET.—The mines are all running, but if we do not have rain soon some of them will be compelled to close down. There is a little excitement at Hunt's hill, caused by the changing of owners. A company from Smartsville has taken over the mine, and the new owners have commenced operations and are now running tunnels, laying pipe and building reservoirs, and intend working the claim on a large scale. These mines at one time paid well, but have been idle of late, owing to a lack of sufficient capital to work them.

SAN BENITO.

STAYTON MINES.—Hollister Enterprise, March 10: The mines never looked better. They are working now a force of about 20 men. The new furnaces do not seem to perform their work very well, and have been shut down in order to make some changes by which the metal can be saved. Some improvements or changes were made a short time ago, but they were not up to the requirements, and the company is determined to spare no pains or expenses until the furnaces are made to work in the best possible manner. It is unfortunate that any obstacles have been thrown in the way, however temporarily, of the progress of this enterprise. The mines are yielding endless quantities of ore of a high grade, and if the furnaces had not proven defective, large shipments of metal would be made each week, besides giving employment to a greater number of hands.

SAN DIEGO.

BARNER AND JULIAN.—San Diego Union, March 8: Mr. Geo. V. King, of the mines, came in from Julian last evening. He informs us that several of the mines manifest

some activity just now. The Ready Relief has just had a crushing of 25 tons of ore, yielding \$1,100. Mr. D. Shoup brought in the bullion last week. Mr. King, David Shoup, S. A. McDowell and Joseph Condy are the lessees of the mine from Mr. Noyhart. The Hubbard mine is looking very well now. It is reported that they have opened an eight feet wide ledge, the lowest rock milling \$20 per ton. The San Diego mine has just developed a fine two feet ledge at the bottom of the winze they have been sinking, which will yield 90 per ton ore. Mr. King says the ledge had abundant rains and will make good crops in the vicinity of the mines.

Nevada.

WASHOE DISTRICT.

COX, VIRGINIA.—Gold Hill News, March 14: Daily yield, 250 tons of ore. The south ore slopes on the 1500-ft level are being worked 85 feet in length and about 25 feet in width, and will furnish a plentiful supply of ore to keep the Consolidated mill steadily crushing for at least three months. In the meantime the drift on the 1650-ft level is being enlarged, turn-tables put in, all timbers laid, and every other improvement being made. The drift on the 1650-ft level. At the Cox & Co. about two splendid five-inch wire cables have just been put in place, and four cables attached to each cable. This will give double the hoisting capacity in a given length of time, the ore dumps at the 1650-ft station being so arranged that each car is loaded simultaneously and no stoppage or delay whatever incurred. In the ore vein on the 1650-ft level the work has been continued for enlarging the drift and making preparations for future operations. The first set of timbers has just been placed in the face of the south drift, intended to connect with the deep winze. A drift northward from this winze is soon to be started on the 1650-ft level to connect with the south drift. Another drift south from the 1650-ft station in this winze is about to be started to make an air connection with winze No. 13 below the 1650-ft level. The mine is fast cooling in every portion, and is now in a good, comfortable working condition throughout. The opening up of the 1650-ft level no longer leaves the least doubt as to the resumption of dividends at no distant day.

CALIFORNIA.—Daily yield, 550 tons of ore. The ore slopes on the 1500 and 1550-ft levels are looking splendidly, every point and are yielding rich ore. The lateral drift on the 1600-ft level. At the Cox & Co. about two splendid five-inch wire cables have just been put in place, and four cables attached to each cable. This will give double the hoisting capacity in a given length of time, the ore dumps at the 1650-ft station being so arranged that each car is loaded simultaneously and no stoppage or delay whatever incurred. In the ore vein on the 1650-ft level the work has been continued for enlarging the drift and making preparations for future operations. The first set of timbers has just been placed in the face of the south drift, intended to connect with the deep winze. A drift northward from this winze is soon to be started on the 1650-ft level to connect with the south drift. Another drift south from the 1650-ft station in this winze is about to be started to make an air connection with winze No. 13 below the 1650-ft level. The mine is fast cooling in every portion, and is now in a good, comfortable working condition throughout. The opening up of the 1650-ft level no longer leaves the least doubt as to the resumption of dividends at no distant day.

CROWN POINT.—The east drift on the 2000-ft level is in over 100 feet, the face still in very solid, hard blasting rock. This rock, however, blasts out splendidly and admits of excellent progress. Provided the ledge retains its uniform dip, surveys recently made show that this drift will have from 250 to 300 feet to run to the ledge, it is now having extended to the 2000-ft level. Every preparation has been made to take care of a flow of water should one be struck. Strong Cameron pumps, run by compressed air, have been put in at the 1800, 1900 and 2000-ft levels. These pumps will each have a lift of 100 feet, or 300 feet in all, to carry the water up to the 1700-ft level, through which it will pass southward to the combination Crown Point and Belcher drain shaft.

BELCHER.—Daily yield, 90 to 100 tons of ore. The old ore breasts on the 1300 and 1400-ft levels are being gradually worked out, and the supply of ore is steadily lessening. The water is again drained from the bottom of the main incline sufficiently to admit of a resumption of the sinking. Putting in another lift pump at the 1850-ft level is about finished.

ORION.—Daily yield, 125 tons of ore. The ore slopes are looking well, and the ore taken out is gradually increasing in value. The average assay of car samples is about \$70 per ton. The east ore streak recently struck on the 1365-ft level is developing into quite a valuable body of ore.

TRONAN.—The shaft is down to the 300-ft level, and drifting both north and south is commenced at that point to open up a new ledge. Both drifts are in excellent ore, which, together with what is extracted in sinking the north winze below the 300-ft level, which is to-day down about 100 feet, gives a daily ore yield of 27 tons.

HALE & NORCROSS.—The water is reduced in the main incline to a point 50 feet below the 1900-ft level. The repairs to the cave in the main incline below the 1900-ft station are being forwarded as rapidly as possible.

NEW YORK.—Hard blasting rock continues to impede the work in the third pump compartment of the shaft. It will not take much longer to finish this much needed enlargement of the shaft, when the pumps will be put in at once.

LADY WASHINGTON.—A station has been opened and a drift started at the 950-ft level in the winze. This drift will run to the eastward and will prospect the ore vein 100 feet deeper than it has ever yet been worked.

NORRIS CO., VIRGINIA.—The character of the vein matter through which the shaft is passing is of the finest kind and gives great encouragement.

DAYTON.—The prospecting drifts on the upper levels have all been suspended for a few days in order to afford an opportunity for leveling and lining up the pumps and pumping machinery. This is being done in order to have everything in the most perfect order in case the drifts when they cut the ore vein should encounter an increased supply of water.

PHIL SHERIDAN.—The east drift on the 400-ft level is steadily advancing toward the ledge, the face in hard blasting ground. It will probably have 50 feet or more to run in order to strike the ledge. The water has very nearly all disappeared.

GOULD & CURRY.—During the first part of the week the diamond drill in the face of the main east drift, on the 1700-ft level, tapped a very strong flow of extremely hot water. The work stopped until the pumps are ready to start up. This will be about the 1st of April.

JESTICE.—Daily yield, 400 tons of ore. A large reserve of ore is being deposited at the Petaluma mill, which will be started up in a few days. The large quantities of water still somewhat retards the advancement of the prospecting operations on the 1000-ft level.

OVERMAN.—Sinking the winze below the 1200-ft level is making steady headway, the ore prospects in the bottom still being of the most favorable description.

SOUTH COMSTOCK.—The new shaft is now down 77 feet below the 300-ft level. The rock breaks and blasts well, and there is no need to contend with, consequently good progress is being made.

IMPERIAL CON.—The drifts on the 2125-ft level are being enlarged and the level is being put in the best possible working condition previous to commencing cross-cutting.

CHOLLAR-POTOSI.—The east drift on the 1785-ft level is steadily advancing, the face in ground of a softer and more favorable nature. The daily yield of ore from the old upper slopes is 100 to 120 tons.

YELLOW JACKET.—Sinking the main shaft is making the usual splendid progress. A new hoisting winch is soon to be added to the machinery.

SILVER HILL.—The north and south lateral drifts on the 650-ft level are each advancing steadily along the west line of the ledge, and each making about four feet per day.

BEST & BELCHER.—The south and middle cross-cuts on the 1700-ft level are being steadily advanced. The middle cross-cut penetrated a small vein of quartz and low grade ore during the first part of the week, but has passed again into soft porphyry.

SUCCESS.—Sinking the main shaft is making the usual good progress. The bottom still in the most favorable character of ground.

LEVATHAN.—At the 650-ft level the drift north has run into good vein matter, carrying considerable ore of a low grade.

URAN.—The erection of the new and powerful air-compressor is being urged forward at a very rapid rate. Arizona. The water is running but little trouble, and the pumps continue to handle it with ease.

BALTIC COX.—Better and larger streaks of low grade ore appear in the face of the main west drift this week.

SAYRE.—The water is being steadily drained from the main incline below the 1900-ft station. The pumps work finely.

UNION CON.—The face of the north drift on the 1300-ft level is still showing some very fine quartz.

JELIA.—The main south drift on the 1800-ft level is steadily advancing, the face still in favorable quartz and low-grade ore. The face of the main south drift on the 1800-ft level is showing a much more favorable character of ore.

KNICKERBOCKER.—The water in the shaft is reduced to the 600-ft level, which is now being drained; but owing to the ground being so heavily saturated with water the progress of drainage is slow.

MINT.—The prospecting station at the 1400-ft level is nearly finished, ready to commence the development of the ledge.

MEXICAN.—The north drift on the 1700-ft level is steadily advancing, the face in a very favorable vein formation.

LADY BRYAN.—The preparation for the erection of the new and powerful hoisting engine is going rapidly forward. The new pumping machinery is all up, in the first class working order.

HOMESIDE.—Favorable looking stringers of quartz are continually being passed through.

FLORIDA.—The main west drift on the 815-ft level is being pushed rapidly forward to cut and prospect the ore vein.

ALLEN.—The 800-ft level continues to give forth its usual yield of 40 tons of good milling ore, keeping the Empress mill steadily pounding away.

AMAZON & GLASSBORO.—The face of the north drift on the 800-ft level is still in ore. The bottom of the winze below the 300-ft level is also showing well.

BUCKEYE.—The quality of ore extracted from the north slopes on the 350-ft level is growing better. The Hope mill is kept steadily running.

WENSTRUCK.—Arrangements are about being completed to resume extraction in this mine very shortly.

BATTLE MOUNTAIN DISTRICT.

ENCOURAGING.—Silver State, March 9: Reports from the mining camps of Galena and Old Battle Mountain are of a very encouraging character. There are now in Galena about 150 men, nearly if not all of whom are at work in the mines. Old locations abandoned for years are being worked, and there is perhaps more excitement in the camp than at any previous time since its discovery. In Old Battle Mountain, in the same district with Galena, C. T. Meader has taken hold of one or two mines and is setting a force of men at work on them, and a new life seems to be instilled in the camp.

ELY DISTRICT.

THE ALPS.—Pioche Record, March 3: The Alps company's mills are both running steadily—mill No. 1, at Pioche, is running on custom and Alps ore; mill No. 2 (which the company intend to reduce to redoubt any one) is running principally on concentration and tailing ore. Co. and Johnson, Vivian and Cutts are, however, having worked at the latter mill some custom ore, the former 30 and the latter 50 tons. The usual force is employed at the mine. The company intend to resume prospecting on the lowest level at an early day.

RAYMOND & ELY have been progressing well with the work of development during the past week. Harkness added some to the working force of the mine. The 10th and 11th levels are being pushed ahead, also a prospecting drift from the 11th level. On the 8th and 9th levels there are very encouraging prospects for ore in some of the undeveloped ground.

CHERRY CREEK DISTRICT.

SOLD.—White Pine News, March 10: The Pacific mine, at Cherry creek, with all the rights and privileges thereunto belonging, was sold by Sheriff Raum last Saturday, to satisfy an execution of \$1,000 and costs. The property was knocked off at \$1,200. We presume, of course, that the bulk of the property was sold to the company, and that within the time allowed by law as the latest litigation over the property would indicate it to be worth many times the amount it sold for.

PENNSYLVANIA DISTRICT.

SALE OF A MINE.—Pioche Record, March 3: We learn that McDougall, owner of several mining interests in Pennsylvania district, has sold one of his claims, on which there is a shaft 180 feet deep, to Charles Hoffman, for the sum of \$14,000. The intention is to put a mill in the district very shortly, as the ore will not pay to transport a long distance.

TUSCARORA DISTRICT.

NEW MILL.—Silver State, March 9: The new mill of the Grand Prize company at Tuscarora, which was shut down immediately after it started in consequence of a fault in the foundation, is again running. The first shipment of bullion was made last Saturday, and consisted of several bars valued at \$11,000. Seventy odd tons of ore from the Grand Prize worked at the Humboldt reduction works before the company's mill was built, yielded about \$25,000, and the bullion averaged 905 fine. Whether the new mill is as successful in treating the ore we have not learned.

EUREKA DISTRICT.

NEW HOISTING WORKS.—Eureka Sentinel, March 10: The Hamburg mining company will, in a few days, award the contract for erecting the hoisting works and putting up machinery on its mining property, situated on Peel Stick hill. The machinery for the works was ordered some time ago, and will commence to arrive here in about two weeks.

IDE MEN.—A stranger coming into town now and seeing the number of men congregated on Main street, would think we had a lively town at present. Yesterday, and the preceding night, a large number of miners from Ruby hill, who have been thrown out of employment by the mining litigation, were in town canvassing the general state of affairs and the probabilities of the work being resumed. The recent arrivals from Virginia City, who came in the hope of securing employment, find themselves badly mistaken, and if anything, worse off than when there. Another draft has been made at the Richmond mine, and but few men will be lucky enough to retain their places during the suspension of work at the two mines.

Arizona.

THE MCCrackEN CONSOLIDATED MINING COMPANY.—Arizona Enterprise, Feb. 24: This company's mill has recently been changed from a dry to a wet crusher, and its capacity greatly increased by the putting in of new amalgamating pans. It now works from 23 to 25 tons per day, yielding from \$1,000 to \$1,200, the monthly average of the mill being about \$35,000. Teams are running regularly from the mine to the mill, 14 miles, and make the round trip in ten days. Large quantities of ore are being broken down in the mine, but on account of the decomposed nature of the ore it takes but few men to get out enough to supply the mill. The company employs at the mine and mill about 50 hands, and preparations are being made for an increased yield of bullion. Abe Bateman, who is now the Superintendent, is a very competent and experienced man, and is very popular with everybody, as is also D. P. Pierce, who runs the mill.

The San Francisco mine, on the McCracken ledge, is being developed and shows every indication of being the equal, in every way, of the Senator, which is the location upon which the company are doing most of their work. The McCracken company own three locations, the Senator, the Alta and the Paimetto, the last named of which is being developed. The Senator, being claimed by John Baker, Grant Blake and the estate of Jesse S. Pitzer, deceased. The San Francisco is owned by Alonzo E. Davis and others and is now under bond to W. M. Leet, of San Francisco, who has a force of men employed and is tunneling. He keeps 15 men at work and the ledge shows the same character of ore as the Senator mine, and is of equal width, the ore body ranging from 35 to 60 feet wide. A mill is to be

THE ENGINEER.

Sectional Caisson Tunnel.

D. Farrand Henry describes in the *Polytechnic* a new style of sectional caisson tunnel in which the sections are to be made of convenient length and form of timber strengthened by angle irons passing round the outside, and sufficient brick-work inside to sink them. They are built inside a coffer-dam with a movable bottom, which has sufficient buoyancy to float them; the coffer-dam to be provided with air pumps, windlasses, chains, etc. The dam containing a section is floated to place, and the weight of the section taken off the bottom by being suspended by the chains. The bottom is then unfastened and towed away, and the section lowered to the bed of the river, being guided to place by piles or other apparatus. The section has water-tight bulk-heads at the ends, and air tubes passing up above the water level.

Air being forced into the section, the men enter and remove the earth from under it and permit it to sink to the required grade. If proper foundation is not found at the grade, the section is lowered till good bottom is reached, and then raised to grade, the excavated space being filled with concrete. To make joints between two sections the timber shell projects beyond the bulk-heads, and the ends of the timbers of the completed tunnel and the section being placed, are brought as near as possible together when the section is sunk. If a good joint is not made it is covered with tarpaulin, or otherwise made secure by divers. Then there will be a water space between the bulk-head in the completed portion and the bulk-head of the last section sunk. A small hole is made in the bulk-head of the completed tunnel, letting so much of this water as will, run out, and if the joint is tight, a partial vacuum is formed, forcing the section against the completed tunnel, to which it is then bolted by properly arranged bolts; the bulk-heads at the tunnel are then removed, the brick-work connected, and the bottom filled in with concrete. Underneath and between the tracks is a drainage tube formed in the concrete bottom; and above is a ventilating tube. The approaches are built up to the first section inside a coffer-dam.

STANDARDS IN PUBLIC PLACES.—The English seem determined that there shall be opportunity for the people to know exactly what the legal standards of length are. We read in the late reports of H. W. Chisholm, Warden of the Standards, that a somewhat notable event of the year has been the laying down at Trafalgar square of several standards of length embedded in a solid platform of granite. All the details of this operation are given in the appendix to the present report. The platform is situated at the foot of the north wall of the square, and the entire cost has been about £450. These mural standards are now available for public use, like those erected outside the wall of the Royal Observatory at Greenwich, only the Trafalgar square standards are on a much larger scale, the platform being nearly 200 feet long. The Standards Commission, in one of their reports, recommended that mural standards of length should be securely fixed for public use in all populous towns, the expenses connected with them to be defrayed out of the local funds. The Warden of the Standards has accordingly sent a circular letter to the local authorities, urging the expediency of their carrying this recommendation into effect, at the same time offering such information as, in his judgment, would facilitate their course of action.

INDIAN ENGINEERING.—Referring to engineering works in India, the *Builder* says: The smallest rill that is allowed to trickle over the edge of an earthen bank wears itself a passage and becomes a destructive torrent with extreme rapidity. On one occasion the water in the Veranum tank is said to have overflowed the whole 12 miles of the bund, and to have breached it in 13 places. On another occasion the engineer in charge of a bund, finding the water rising with more rapidity than he was able to meet by the supply of earth, made a wall of the bodies of his laborers, causing them to lie down close to one another on the top of the threatened part of the dam, and thus keeping back the two inches or three inches of water, which, if unchecked, would soon have wrecked the whole bund and ruined a whole district, until their places could be supplied with baskets full of dirt. It was an original expedient, but it saved the district. What the laborers said about it we have not heard.

A DIRECT RAILWAY FROM ENGLAND TO INDIA.—One of the possible railway projects which is now being agitated in Great Britain, but may not be realized for a score of years, says the *Railway World*, is the establishment of direct railway communications between England and India. There are so many political and commercial reasons for the creation of such a stupendous through route, that it is clearly one of the probabilities of the future, and many of the details relating to the missing links have already received earnest attention. If we assume that the necessity of sailing over the English channel from Dover to Calais; and the crossing of the Bosphorus at Constantinople will never be abolished, the difficulties to be surmounted are mainly those presented by the construction of railways through Asia Minor, Persia, and Beloochistan.

Discussions on Dynamite.

The English engineers are still figuring on the comparative value of dynamite as an explosive. Mr. J. C. Mackay, who is now engaged on the works of the tunnel which is in course of construction at Dowlais, Glamorganshire, directed attention to the need of a highly disruptive explosive, and, at the same time, of one available to carry on the arduous operations of the miner with safety and economy. He pointed out that such an explosive should not be affected by damp, should not require large borings, involving expensive works, should not generate an accumulation of smoke, nor be too easily ignited, and should possess facility of transport and storage. He showed that dynamite, in careful hands, fulfilled to a great extent all these conditions, and was especially adapted for tunneling through hard strata of rock. It was not injured by moisture, a quality which no other explosive possessed, it would only explode by detonation, and was not explosive by ignition. It presented an economy in labor which, as compared with other explosives, was in the ratio of four to three. The result of the comparative cost of experiments in Clifton tunnel, for driving 15 lineal yards, he gave as follows: For powder, £29 10s; for gun-cotton, £18 2s; for dynamite, £16 10s. Mr. Mackay also referred to the results obtained by experiments under his own observation at Dowlais, and pointed out that the use of dynamite must be regulated by the character of the rock, and though most economical when applied to harder rocks, it was found to be less useful in the case of coal and the softer friable rocks.

TELEGRAPH EXTENSION.—At a late meeting of the Atlantic and Pacific Telegraph Company, Mr. Thomas T. Eckert, President, submitted a report in which he recommended the construction of 10,000 miles of new lines, completing the system of wires operated by the company and connecting every important city and town in the Union. Work on the main lines, in his judgment, should be commenced immediately, and the branch network extending to the small towns should be constructed afterwards as rapidly as possible. The report was adopted enthusiastically, and the work on the new lines will, it is stated, be begun at once in accordance with the vote. To provide the sinews of war \$600,000 was subscribed, to be paid into the treasury of the company by installments of 25% a month. This subscription takes up the remaining \$3,000,000 of authorized stock previously undisposed of at the market rate of 20% of its face value.

THE ENGINEER A COSMOPOLITAN.—In a recent lecture Mr. Thomas Carghill, C. E., pointed out the extensive scope of the engineering profession, which, without any invidious comparison, he maintained was greater than any other. The engineer was by profession and nature a cosmopolitan. His operations were not confined to any particular district or locality, but had the whole world for their field of action. He did not attempt to mark out any special line of preparatory training, as there were plenty of colleges and schools where a good technical education could be acquired; but he would enforce upon his audience the absolute necessity of all intending engineers entering by the door, and not by the window. The days of rule of thumb were gone by, never to return. The profession had become an essentially scientific one, and its avenues were more stringently guarded than heretofore.

CRYSTAL PALACE RESTORED.—Iron says the Lord Mayor of London has issued a circular having reference to a meeting shortly to be held for a purpose which will be found in the following paragraph, which concludes the printed invitation—"To meet the possibility of your being unable to attend, I should inform you that the plan of restoring the Palace and grounds to their original state of beauty and usefulness is by the formation of a new association, called the 'Crystal Palace of Arts of All Nations (limited)', the shares in which are to be £1 each, and the net profits of each year are to be distributed, not as in a commercial undertaking, by dividends, but in the form of prizes, in accordance with the Art Union Act of Parliament, and on the same principle as the Art Union of London, of which Lord Houghton is President."

THE TYNE BRIDGE.—One of the finest engineering structures of its kind in the world is the swinging bridge over the Tyne, at Newcastle, the construction of which has just been completed after eight years' labor. The bridge is described as of extraordinary strength, both in the masonry and in the immense iron super-structure, and is the largest and most imposing work of the kind in England. The center pier, which supports the massive swing-girder, weighs 1,500 tons, and is said to be unequalled in Europe. The gigantic fabric has a total length, between the abutments, of 530 feet, and a total width of 48 feet, the width of the roadway being 22 feet, while that of the foot-paths is eight or nine feet.

CONCRETE BRIDGE.—At Seaton, Eng., a three-arch bridge is being built of concrete, on a new principle invented by Mr. Brannon, of London. The idea of the inventor is that concrete would, for such work, prove far more enduring than stone. The toll house at the end of the bridge is being built on arches. Mr. Brannon suggests that by building cottages on arches, instead of on the solid ground, all fear of fever caused by exhalations from the soil would be avoided.

Rights of Land to Water.

At the last meeting of the California Academy of Sciences, Prof. Davidson, of the United States Coast Survey, read the following in continuation of his series of papers "On Irrigation in India, Egypt and Italy."

A vital issue that naturally arises in the subject of irrigation, is the relation of land not bordering water to the use of that water. It is the old question of riparian rights with the new complication of States rights, and of the irrigation of broad districts. Honest differences of opinion upon this, as upon all other important questions, must exist; arguments and illustrations are plentiful on each side, but when we look at the problem in its broadest, most liberal and really grand phases, all minor considerations must be held in abeyance. Where irrigation is a necessity, all irrigable lands should have equal rights to the water available for that purpose, and the water should be so wedded to the land that the fee simple to the latter should include the former. Their bond should be indissoluble under any process of law. In all sales and transfers the water must go with the land, and the land must carry the water.

The full development of our extensive valleys depends wholly and solely upon this broad proposition. In consecutive seasons of drouth the main supply of water will be reduced, and in such cases the percentage of water to each acre would necessarily be reduced, thereby involving the watering of a less number of acres. If the farmer with 1,000 acres can, in such seasons, receive only a half supply of water, he may use the water allotted to him for such proportion of acres, or for such crop as he may decide upon.

How Shall Water be Sold?

Upon this point there exists a multiplicity of opinion, and a great diversity of practice in the various countries where irrigation is a necessity and where it has been practiced for ages. There are differences of opinion among the best informed engineers of India; arising partly from the character of the section of country studied, but principally from the condition and peculiarities and traditions of the inhabitants. There the prevailing feeling is strong against any system of selling water by volume; but the unique relation of the native cultivator to the Government molds and influences the judgment. The reasoning that favors it in India finds no similar conditions in the United States. There the government is virtually the landlord, who delegates to the engineer authority to decide at once what land and what crops shall have water, and how much. There is no appeal. Fortunately he is in a position to judge fairly and honestly, and the cultivators almost invariably acknowledge the justice of the decisions.

But the methods depending upon the flooding of arable lands at a fixed price per acre, according to the crop, are not equally just to the cultivators of different soils differently situated, and lead to abuse in the application of the water, to bad drainage, the formation of swampy lands and consequent malarial fevers. It is a wasteful use of the life-blood of a parched country, and, in seasons of drouth, would, from our standpoint, lead to dissension and trouble. In India, as well as at home, on a small scale, the evil effects of the system are too frequently seen. It is a safe estimate that the amount of water thrown upon the land by flooding, per acre, is twice that which is necessary. Some authorities have shown cases where it has been as high as ten times that required to mature a crop.

In Italy and in Spain the water is sold by measurement, and in some localities daily sales are made of the water to the highest bidder!

In the Gold Mining Regions

Of California, the sale of water is an established custom, and it certainly seems a reasonable proposition to apply a similar method to the water of irrigation.

The main canal of each district is constructed to supply a given volume of water for the irrigation of a specified number of acres of arable land, based upon the general proposition that each acre requires 12 inches of water (more or less) during the season to mature ordinary grain crops. And the scheme of the distributing channels and irrigating ditches is necessarily designed to carry this volume of water to the different sub-areas at reasonable intervals.

When the water is thus ready for the fields the question for solution is the manner of selling it. The flooding per acre is in reality a means of measurement of the crudest character, and not suited to the temper of our citizens. The method of selling in Italy is by measurement, but does not appear satisfactory; the majority of engineers in India condemn it.

I have no hesitation in recommending the sale of water by measurement; and that the method adopted by the miners of California, or such modification of it as experience has shown to be advisable, or which the change of conditions may suggest, is the simplest, most direct, and most satisfactory.

The Quantity of Water Necessary to Raise a Crop.

Practico and the authorities differ very much on this all important question, doubtless because of local and ever-varying circumstances of rainfall, evaporation, percolation, absorption, crops, soil, wastefulness, etc., which enter largely as disturbing elements.

There are plenty of statistics to show the actual duty of water, but all exhibit results far short of the theoretical duty; the two should and would agree if proper factors be assigned to the different elements governing the problem.

The best authorities assume a depth of from 10 to 12 inches of water to the production of a crop of wheat, barley, and maize, when applied in waterings of four times two and a half inches (Login), or of three times four inches (Beresford). The smaller of these results is almost identical with the amount deduced from observation in the great valley of California, where a rainfall of 10½ inches, fairly distributed, has insured a large crop of wheat, etc. (Report U. S. Commissioners of Irrigation).

But different crops require different amounts of water. Taking the average of a number of Indian authorities, the quantity of water necessary to raise the various crops may be stated as follows: Wheat, barley, maize, etc., 1,300 cubic yards per acre, or a total depth of 9.7 inches over the soil. Wheat is the crop of upper India and is raised at the season when water is scarce and precious. Rice, 3,500 cubic yards per acre, or a total depth of 26 inches over the soil. Rice cultivation is carried on in the autumn, when there is, ordinarily, plenty of water from rainfall available. Sugar cane, 8,000 cubic yards per acre, or a total depth of 59½ inches over the soil.

If we assume that ten inches of water is necessary for one crop, each acre will require a total amount of 36,300 cubic feet; hence one cubic foot of water per second for 24 hours would furnish a supply sufficient to irrigate 2.38 acres, and further, that one cubic foot of water per second for 100 days would give water sufficient for a crop on 238 acres. This, let it be distinctly understood, is exclusive of rainfall. At those seasons in India when there are partial rains, some sections receive two waterings from canals or wells, others only one, and all are lighter than the average of the dry season waterings. Under these conditions their engineers report that during the rainy season the duty of water is almost doubled. If this be taken as a point of departure, we should expect that a total amount of irrigating waters added to the small rainfall would suffice for an acre, or one cubic foot of water per second would, in 24 hours, afford a supply sufficient for 4.76 acres; and running for 100 days would be sufficient to irrigate 476 acres; but their figures vary from 320 to 384 under these conditions.

Their conclusions in relation to the theoretical duty of water (running one cubic foot per second) is a total of 500 to 600 acres in two crops per year. But even this theoretical duty is too low, for there are examples in Spain where the duty has amounted to 1,000 acres.

Per contra, the actual duty in the best divisions in India is not over 160 to 180 acres in two crops per season, or one-third of their calculated theoretical value! The average duty of the whole Ganges canal (except the Cawnpore division,) in 1873-4 was only 155 acres, and of the distributing canals 189 acres, each the sum of two crops.

We can, therefore, readily understand the warning of one of their latest investigators, when he says: "If the question of increasing the duty of water is not solved in some form, a great many of our new canals must be financial failures. Their future profits have been calculated on duties that are not obtainable on our oldest canals. Waste is inseparable from works like our great canals, but there are no such physical or practical difficulties in the way as will oblige us to be content with the present state of things."

These warnings have double weight in California, because we are commencing without profiting by the dearly bought experience of others. Beresford has endeavored to formulate the efficiency of the water of irrigation by introducing functions determined by experiment; and in so doing he has taken the subject away from the rule of thumb.

He says: Each cubic foot of water entering the headworks of a canal is expended as follows: 1st. In waste by absorption and evaporation in passing from the canal-head to the distributing-head. 2d. In waste from the same causes in passing from the distributing-channels to the secondaries or ditches. 3d. In waste from the same causes in passing from the secondaries or ditches to the fields. 4th. In waste by cultivators through carelessness. 5th. In useful irrigation. But among the sources of waste from evaporation should have been included the very considerable one of the water when spread as a thin film over the ground in flooding. Yet another function has not been considered, namely, that depending upon the special demands of each class of soil and crop. In his investigations he has shown that the chief part of the loss is due to absorption and percolation; that old canals exhibit less loss than new ones; and that more waste occurs in excavated than in embanked canals.

The loss by evaporation up to the point where the irrigating water reaches the field is only 5% of the probable discharge of the canal; but when the water is spread over the fields the loss may amount to 20% or more. This would entail a total loss of 25% by evaporation!

Again, he says that loss by absorption along the canal and distributing channels and ditches is greater than the loss by evaporation; he even places it as high as 33% of the whole volume of the great Ganges canal!

These sources of loss amount to no less than 53%, and we can readily understand how the wastefulness of the cultivators may increase that loss to fully 67%! This at once reduces the actual duty of the water, measured at the source of supply, to one-third of the so-called theoretical duty.

The lesson to be learned therefrom is, that loss by absorption should be prevented, and loss

by wastefulness of the cultivator reduced by stringent oversight and by rigid measurement.

But it may be asked how all these apparently conflicting results may be applied to the driest parts of California? I should state them broadly, thus: One cubic foot of water per second for 150 days would furnish 12,960,000 cubic feet, or a quantity affording a total depth of ten inches over 357 acres of land; 1,000 cubic feet of water per second for the same period would supply 357,000 acres. And if the canals, channels and ditches are constructed no better than they are in India, and if the farmer was just as wasteful of the water, this area of land would be reduced fully one-half, or say to 180 acres for each cubic foot of water per second for 150 days. On the other hand, the rainfall would, even in a season of only six or eight inches supply, doubtless supplement the loss by evaporation, absorption and waste, and bring the duty up to 357 acres.

But with low grades to the canals and channels, unpuddled bottoms and sides, and inferior plans and work, it would be next to impossible to make a close approximation to the actual duty of water; anything less than the above duty suggests necessity for improvement in all the sources of waste.

In estimating the total acres that can be irrigated from a given supply, allowance must be made for the amount lying fallow, wood-land, marsh, roads, streams, towns, etc. In India the average under cultivation each season is only one-third of any given area; in this country we might safely estimate it at two-thirds of any irrigation district.

Desert Lands.

Senator Booth's bill to encourage the irrigation, sale and settlement of desert lands, has become a law, and such portions of our western territory are now open to enterprise and may be made applicable to settlers so soon as formal regulations and instructions shall be issued by the Interior Department. Senator Booth, in the course of an able report recommending the bill for passage, made the following interesting points:

There are extensive regions of country in the States and Territories named in the bill where there is not sufficient rainfall to render the cultivation of the soil possible without irrigation. In other words, large portions of the country from the Rocky mountains west are deserts, but it has been ascertained that by irrigation these lands can be made exceedingly productive. The subject of irrigating these lands has attracted the attention of the Interior Department and Congress for many years, and various schemes have been proposed to Congress, and to the States interested, to secure aid for that purpose; but Congress has hitherto wisely, as we believe, refused to aid any of these projects further than to provide for examinations and reports upon the subject.

The whole subject should be left, as far as practicable, to private enterprise, and the Government should interfere as little as possible with the subject. It is certainly best to give the people an opportunity in the first instance, and when they have failed to utilize both the water and the land it is time enough to call for Government aid or legislative control, but it is necessary that the people have an opportunity to acquire title to the lands before private enterprise will undertake a reclamation of these deserts.

Experience has shown that the homestead and pre-emption laws afford no means of acquiring title to desert lands. Those laws require settlement and occupation as a prerequisite. Neither settlement nor occupation is possible without water. Irrigation must precede the settlement. But this is expensive, and settlers upon the public lands are unwilling to construct the necessary ditches and canals to irrigate lands to which they have no title and no certainty of obtaining title.

It has been suggested that these lands be sold in large quantities in order to induce private capital to undertake the work of their reclamation. Your committee fear that any system of sale whereby the title would pass before irrigation, would encourage speculation without inducing settlement. The bill provides for the sale of a section of land to any person who will first irrigate the same, at the usual price of \$1.25 an acre. A more liberal policy has been suggested of granting lands, after irrigation, without any money consideration. But the committee believe that when these lands are irrigated they will be of sufficient value to enable the purchaser to pay the Government price charged for other public lands. Besides, the quantity allowed will be an additional inducement to settlers to undertake the work of irrigation. At all events, it will be time enough to make donations of these lands when it is ascertained that settlers are unwilling to purchase them. It is believed that by far the larger portion of the lands bordering on the streams, where sufficient moisture exists for cultivation, and where irrigation is cheap and easy, have been appropriated, but the provisions of this bill enable settlers by combined effort to construct more extensive works and reclaim a class of lands that are now absolutely worthless.

The bill, in its full text, is as follows: A bill to provide for the sale of desert lands in certain States and Territories: Be it enacted, etc., That it shall be lawful for any citizen of the United States, or any person of requisite

age "who may be entitled to become a citizen, and who has filed his declaration to become such," to file a declaration with the register and the receiver of the land district in which any desert land is situated, that he intends to reclaim a tract of desert land not exceeding one section, by conducting water upon the same, within the period of three years thereafter. Said declaration shall describe particularly said section of land if surveyed, and, if unsurveyed, shall describe the same as nearly as possible without survey. At any time within the period of three years after filing said declaration, upon making satisfactory proof of the reclamation of said tract of land in the manner aforesaid, and upon the payment to the receiver of the sum of one dollar and twenty-five cents per acre for a tract of land not exceeding 640 acres to any one person, a patent for the same shall be issued to him.

Sec. 2. That all lands, exclusive of timber lands or mineral lands, which will not, without irrigation, produce some agricultural crop, shall be deemed desert lands within the meaning of this Act.

Sec. 3. That this Act shall only apply to and take effect in the States of California, Oregon and Nevada, and the Territories of Washington, Idaho, Montana, Utah, Wyoming, Arizona, New Mexico and Dakota.

USEFUL INFORMATION.

Requisites of Good Brick Clay.

During the summer there has been considerable inquiry into the character of the clays of this State and their adaptation for the manufacture of stone-ware, fire brick, etc. Another branch of the subject is the adaptation of clays for brick-making. In the course of an elaborate article in the *Polytechnic Review* on the general subject of clay for brick, we find the following:

We find that the clay employed in brick-making is composed of alumina, with greater or less proportions of silica, lime, water, iron and other components, as indicated by subjoined analyses. We find these grades of clay used in brick-making:

1. Pure, rich, strong clay; composed almost entirely of alumina and silica, with some iron, lime and magnesia. 2. Loams. 3. Marls.

We may say in general that the best brick clays are composed of silica three-fifths, alumina one-fifth, and the remaining one-fifth of iron, lime, magnesia, soda, potash and water. Where there is an excess of alumina over the silica, the bricks are apt to crack in burning; the presence of silica remedies this by rendering the bricks more porous. Where sand is added to the clay, it should be clean, sharp, fusible and not too fine; proper selection and proportion insure a hard, strong, ringing brick of good color. For the finer grades of bricks, a finer sand may be used. Foundry sand ("fine sand"), is not at all suitable; good building sand should be a proper material.

Loamy clays need the addition of lime as a flux; and are most commonly improved by the use of lime and ashes or "breeze," which, although affecting the color, benefit the burning. Sandy clays may be improved either by the addition of richer or purer clay, or by the tedious and expensive process of suspending them with water and using those portions which remain longest in suspension.

Brick clays often contain mica, feldspar, phosphate of iron, etc. Where mica and feldspar are present in connection with oxide of iron, they act as fluxes; and in known quantities either of them is helpful rather than undesirable. Flints and large lumps of carbonate of lime or of gypsum are injurious. Clays containing lime and little iron burn easily, as do those containing carbonate of lime; but the presence of carbonate of lime is injurious, as in the kilns this material is converted into quick-lime, which, afterwards slaking under the influence of air and moisture, bursts the bricks.

Pyrites is a very objectionable component of brick-clays; as the process of burning expels the sulphur, leaving behind ferric oxide or a basic sulphate, occupying less volume than the pyrites, and causing shrinking. For a similar reason, roots, sticks and other organic matter should not be present in the clay. Stones injure the bricks by expanding during the firing, and afterwards contracting more than the clay—thus leaving pits or holes surrounding them.

To Find the Contents of Boilers, Etc.

To find the contents of cylinder boilers multiply the area of the head in inches by the length in inches and divide the product by .1728; the quotient will be the number of cubic feet of water the boiler will contain. Example: Diameter of head, 36 inches; area of head, 1017.87 inches; length of boiler, 20 feet or 240 inches. Now multiply 1017.87 by 240 and the product will be 244,288.80; divide this by .1728 and the result will be 141.37 cubic feet, which will be the contents of the shell.

In fire boilers, multiply area of the head in inches by the length of the shell in inches; multiply the combined area of the flues in inches by their length in inches, subtract this product from the first and divide the remainder by .1728; the quotient will be the number of cubic feet of water the boiler will contain.

To find the requisite quantity of water for a

steam boiler: Add 15 to the pressure of steam per square inch; divide the sum by 18; multiply the quotient by .24; the product will be the quantity in U. S. gallons per minute for each horse power.

To find the required height of a column of water to supply a steam boiler against any given pressure of steam: Multiply the boiler pressure in pounds per square inch by 2.5; the product will be the required height in feet above the surface of the water in the boiler.

Another rule to find the requisite quantity of water in a steam boiler when the number of pounds of coal consumed per hour can be ascertained: Divide the number of pounds of coal consumed per hour by 7.5, and the quotient will be the required quantity of water in cubic feet per hour.

The Insecurity of Iron.

The Ashtabula disaster, says the *Mechanical Journal*, will increase the suspicion with which iron bridges have always been regarded by a good many persons. They will recall the terrible accident at Dixon, Illinois, on May 4th, 1873, when a new iron Truesdell bridge, believed to be in perfect condition, fell under a crowd who had gathered to witness a baptism, and many persons were horribly crushed and drowned. Other bridges that have unaccountably given away with less terrible results will be brought to mind by every railroad man or builder. There is no doubt that if security from falling is alone considered, no sort of bridge is so safe as a properly built wooden one, kept in good repair. The reason is that the strength of timbers is easily estimated and un-soundness readily detected, while on the other hand the strength of iron is dependent on subtle chemical and molecular laws, about which physicists are still in doubt. Constant jarring, for example, creates a peculiar crystallization among the particles of an iron bar or wheel which, without giving the slightest indication of itself, renders the metal liable to give way at any time. That iron is more brittle in intense cold is a fact as certain as experience can make it. The scientists may be correct in claiming that is not owing to changes in molecular system of the iron itself, but it may in many cases be accounted for by the inelastic condition of road beds and the earth generally, which throws a much harder strain upon iron rails or any iron structures in zero weather. Moreover, the cases where fractured cannon, broken car wheels, axles, or other iron fabrics, show old cracks, rust-marked, half destroying the strength of the article, and yet which have, again and again, escaped detection from the closest examination, show how difficult it is to tell when iron becomes unsound, even from the simplest causes. It is not likely, however, that wood will ever come back into general use for bridges. And such being the case, this Ashtabula horror emphasizes once more the necessity of a more exhaustive study of the chemistry and molecular structure of iron. The vast and constantly increasing extent to which it is entering into use for every species of building, makes this the most practical problem of modern science. But while the scientists are about their task, the Legislatures have something to do. There is at present no federal or State law requiring any particular strength in bridges. Builders may make what they please. Legislation of course cannot adequately deal with this complex matter, but what guaranty a proper law can afford, should promptly be given.

GOOD HEALTH.

Treatment for an Ulcerated Tooth.

Dr. Geo. L. Parmelee, of Harvard University, writes to the *Journal of Chemistry*, telling the cause of ulcerated teeth and the treatment therefor. If a longitudinal section be made of a tooth, a cavity nearly corresponding in shape to the external contour of the tooth will be found. This cavity is prolonged into the root, or roots, if there be more than one, and opens by minute orifice at the extremity of each. This is called the pulp cavity or chamber, while those portions extending into the roots are distinguished by the name of pulp canals. This pulp cavity is occupied by a highly vascular and nervous tissue, the dental pulp, which is continuous through the opening at the end of the root, with the vessels and nerves which supply the teeth and adjacent parts.

When from any cause the pulp of a tooth dies, what happens? The pulp being dead, of course decomposes; and if allowed to remain in the tooth, the gases arising from this decomposition must find a means of exit. If a cavity of decay exists, freely open, the gases arising from the dead pulp will escape through the cavity, and no trouble results. But should this cavity be closed, either by the impaction of food, a filling, or any other cause, the gases, finding no other vent, are forced through the minute orifice at the end of the root, where the vessels entered which supplied it with life, irritating the root membrane of the tooth and the surrounding parts. This irritation causes inflammation, and as this progresses pus is formed.

The first indication we have of this variety of toothache, is a slight soreness on shutting the teeth together, or on striking the affected tooth.

Soon the soreness increases, the tooth feels as if it was more prominent than the others, and one has a desire to be continually feeling of it, to see how things are progressing. The pain is dull, throbbing, and, owing to the parts being confined by hard, bony walls, severely intense, the whole jaw sympathizing.

As it is often necessary to destroy these pulps, what should be done to guard against toothache of this variety? After the life of a pulp has been destroyed, by the application of medicine to it, or any other cause, it should be hardened and withdrawn from its cavity—which is not a painful operation—the parts thoroughly disinfected, and the cavity carefully filled. If teeth are treated in this way, the chances of trouble are greatly lessened, and they may be retained as useful organs for many years and perhaps for a lifetime. What shall we do if this trouble does arise? Consult a competent dentist, not one who has picked up a little knowledge of teeth, and is a mere extractor and plugger of these organs, but one who has been thoroughly and scientifically educated for his calling, and he will know what to do. In case for any reason this is impossible, you may be able to relieve yourself.

In the first place do not delay in hope that the tooth may feel better, but attend to it at once. Remove if you can all foreign matter from the cavity, thoroughly washing it with tepid water, and get an opening into the pulp chamber. This alone will often cure it. Paint the gum freely all around the tooth with strong tincture of iodine, first drying off the moisture from the gum. Hold ice-cold water or lumps of ice continually in the mouth, but should you start on this cold water method of treatment you must keep it up for several hours, or it will be worse than useless. Hot foot-baths and saline cathartics. Let the tooth alone, do not keep feeling of it, thus keeping up the irritation which you are trying to allay. Remember that this form of treatment is not applicable to an exposed living pulp, but only in cases where this organ is dead. Cold water applied to an inflamed living pulp would only increase your agony.

Should you find that you cannot arrest the inflammation after a sufficient trial, you will have to take the other course, and that is, to hasten suppuration by warm applications directly to the part. For this purpose nothing is better than a split fig, roasted and laid on the gum. Warm fluids held in the mouth will sometimes afford relief. But it is wiser to go at once to a competent dentist, as serious trouble often arises from this form of disease. Never, on any consideration, apply poultices to the outside of the face, for should the abscess point and break there, a permanent and unsightly scar would be the result.

In closing I would say, that as "an ounce of prevention is worth a pound of cure," it would be much better to attend to your teeth in time, before the pulps become exposed, and save your teeth and yourself all this pain and trouble. You will never find any artificial teeth that will be the source of as much comfort as your own natural organs properly taken care of.

Analyses of Hair Dyes.

It is well for the public to know that most of the preparations for changing the color of the hair are vile poisons, though they are advertised as harmless. The *Medical and Surgical Reporter* says that the London *Lancet* had recently 21 "hair restorers," "hair dyes," analyzed. Out of the 21 examples examined, no less than 14 were practically identical in their nature. They contained sulphur, in suspension, and also lead in varying, but always very considerable, quantity. Three of these preparations have American labels, the rest were English. The descriptions varied a good deal. Only one was plainly described on the label as poisonous, if taken internally, while many were described as "perfectly harmless," "free from injurious substances," and so on. The prices varied from 25 cents to \$1.50 per bottle.

Two more samples, one of them American, were found to contain lead and sulphur, but in a different form. The sulphur was present as hyposulphite, and, in fact, these preparations may be substantially imitated by adding hyposulphite of soda to a solution of a lead salt. A white precipitate first appears, which dissolves in excess, and the solution so obtained does not give a precipitate with iodide of potassium. This is noteworthy, because in the handbill which accompanies one of the samples, purchasers are warned against the dangerous hair preparations which contain lead, as likely to lead to paralysis of the brain and insanity, and are directed to test all preparations with iodide of potassium.

In another sample, an American one, no free or loosely combined sulphur was found, but only lead, in considerable quantity.

Another of the preparations was contained in two bottles; in one of which ammonio-nitrate of silver, and in the other pyro-gallic acid was detected. This, therefore, belongs to an entirely different class from the preceding.

The remaining three preparations analyzed were intended for lightening, instead of darkening the color of the hair. No substantial difference between these samples was detected. Each was found to contain a tolerably concentrated and slightly acidulated solution of peroxide of hydrogen. It is well known that this is the active agent in preparations of this kind. It can hardly be considered as poisonous, but its action on the hair is said to be injurious.

MINING SCIENTIFIC PRESS.

W. B. EWER..... SENIOR EDITOR.

DEWEY & CO., Publishers,

A. T. DEWEY, GEO. H. STRONG,
W. B. EWER, JNO. L. BOONE.

MINING DECISION BY THE U. S. SUPREME COURT.—The decision rendered a few days ago by the United States Supreme Court, in the case of Solomon Heydenfeldt vs. the Daney gold and silver mining company, is the first mining case ever decided by that court. The opinion, delivered by Justice Davis, affirms the Nevada Supreme Court's decision, with costs, and that court affirmed the decision of Richard Reising, District Judge for Storey county. Judge Davis, speaking for the United States Supreme Court, held that the act of Congress, of March 21st, 1864, authorizing the people of Nevada to form a Constitution, under which act Nevada selected and conveyed the lands in controversy to the grantees of Heydenfeldt, did not constitute a grant in present of the premises; but that the grant remained inchoate and incomplete until the land was surveyed by United States authorities and the survey properly approved. Secondly, that survey and approval not having been made prior to entry to the company's predecessors in interest for mining purposes, the land was not by act of Congress, or in any other manner, ever granted by the United States to Nevada. Third, that under the entry of the company's grantees and their rights thereto, having become established prior to the survey of section 16 by the United States, the land was not included in nor did not pass to Nevada by the granting clause of the act of 1864, but, on the contrary, was excluded therefrom because previously possessed and occupied by defendant's grantees for mining purposes in conformity with the mining laws, rules and customs of miners in the locality where it is situated, and in conformity with the mining act of Congress approved July 26th, 1866.

The Egyptian Finance Committee have accepted the proposals of M. de Lesseps, made in the name of the Suez Canal Company, to complete and work the canal between Cairo and Ismailia, provided the company be authorized to levy certain dues upon vessels passing through the canal. Nearly completed works were formerly abandoned for want of funds. By the execution of Lesseps's plan, large tracts of desert land will be reclaimed to cultivation.

Foundry Notes.

The foundry business in San Francisco has been very dull during the past winter, but the foundrymen hope for better things with the advent of spring. Last summer trade was quite brisk, as a great deal of heavy machinery was sent to the Comstock. Of course in the winter months it cannot be expected that the manufacturers of machinery will have as much to do as in the summer when the roads are all open, but the past winter has been exceptionally dull. There is, naturally, small work of various kinds to do at all seasons of the year, but jobs, even of this kind, have not been as plenty as usual this winter. The depression which has existed for so long a time in the mining stock market has exercised an influence detrimental to the foundry business. It has created a distrust among capitalists, and prevented their investing any money in mining machinery, even in places where it was in contemplation to do so. The foundrymen in this city are mainly dependent on the mines for their very large jobs, and when the mining business is dull the foundry business is also. Most of the prominent mines on the Comstock are now supplied with first-class machinery, made at the San Francisco shops, and as new mines come into prominence they too must have good machinery. Still, with a dull stock market, very little new work of this character is ordered. The excitement in regard to Arizona mines at present may shortly make a market for mining machinery in that direction. One of our prominent foundrymen expresses the opinion that as much machinery will go this year to Arizona as to Nevada, as capitalists seem to be manifesting a desire to invest in Arizona mines, and there are plenty of good ones there to put money into.

The Union Iron Works have taken advantage of slack times to build a very fine new crane or derrick. It is quite an imposing structure, strongly built, and capable of lifting a weight of 40 tons; and Mr. Scott says he would not hesitate to trust it with 50 tons if occasion required. It is supported with seven braces of one and a half inch wire rope, running from the top of the upright to as many different supports. Where not convenient or judicious to fasten to the buildings, heavy beams are raised on end to take the outer ends of the wire ropes. These are on the extreme edges of the foundry lot outside of the buildings. The derrick is 40 feet high, and the arm is, from the mast, 40 feet long. The upper timber is made of wood 26 inches deep and 10 inches wide, and the whole structure is of corresponding strength. The derrick is handled by two small engines, but can be handled by hand when necessary. It is arranged to run 12 different speeds. The main chain for holding the weight is one and seven-eighths inches in size. The arrangement for swinging the crane is a friction device, similar to that used on an ordinary mining brake so that if there is too much momentum the weight has no chance to do any damage, as is the case when toothed gear are used. This a very useful addition to the outfit of this foundry, already very complete.

The Pacific Iron Works are comparatively busy just at present, although they have shared in the dullness felt by the other works of late. They are just shipping a 10-stamp mill to the Black Warrior silver mine in Peck district, Arizona, and building a full 10-stamp silver mill for the Hackberry mine, Arizona. With the latter goes a White rotary furnace for roasting ore. They have just put in place a new boiler for the steamship *California*, and shipped a 16-inch hoisting engine for the Gover mine in Amador county. The works recently built a new furnace for the New Coso mining company in Inyo county, with a capacity of 60 tons per day. This was built with cast-iron sectional water jackets. They also built a furnace for the Richmond mine in Nevada. They built the engine, boiler, winding-gear, etc., for the Sutter Street wire cable road, which recently went into operation in this city. Beside the mill for the Hackberry mine, referred to above, they have now in hand a furnace, engine, boiler and outfit for the Edith quicksilver mine in Lake county. This furnace has a capacity of 10 tons per day, and the owners of the mine intend putting up three or four more after this is started. A 14-inch engine and boiler are being built for the flour mill of Dorman & Co., corner of Sacramento and Drumm streets, in this city. They are doing some repair work on the steamer *Idaho*, and have considerable small work on hand.

JUMPING mining claims has been so successful of late that some people imagine that they can "jump" the whole property of a mining company. A case of this kind recently occurred in Alpine county, where some wisecracks relocated the Pittsburg mill, with boiler, engine, pans, battery, etc.

THE miners' strike at Wellington continues. There is no hope of a speedy adjustment of the difficulties. The 42 men who went up in the *City of Panama* to fill the strikers' places are still at Victoria.

PATENTS.—The Committee on Patents in the U. S. Senate is as follows: Wadleigh, Chairman; Booth, Chaffee, Kernan and Morgan.

Comstock Papers.—No. 19.

They go Actively Into the Business of Exploring The Country and Locating Claims.

In the last number of these Papers, we were led to remark upon the manner in which the Washoe miners, through an over-estimate of the mineral wealth of the country, were at the start betrayed into many wild schemes and much prodigal expenditure. In nothing did this excessive confidence display itself more signally than in the expedition with which the region for many miles around was explored, the numerous mining districts that were organized, and the multitude of claims that were taken up. Not until the month of September, 1859, did the new crop of adventurers begin to arrive in the Territory in considerable numbers, and yet within 16 months from that time as many as 25 or 30 different mining districts had been formed, the country from Esmeralda to Humboldt, and from the base of the Sierra Nevada east for a long distance having been run over and settled with scattering mining camps. The area thus partially explored and populated amounted to some 10,000 or 12,000 square miles, while the number of linear feet located might be literally counted by the million. That not much attention was paid to the

Mineralogical Character of the Ledges Located

It is needless to say, very little pains having been taken to determine whether they were ore-bearing or not. It was enough that there was a ledge or the semblance of one, the inexperienced and excited prospector concluding that any, even the smallest and most barren quartz croppings, were worth taking up, if indeed they did not present conclusive evidence of valuable mineral deposits below. The more claims of whatever kind a man was able to get hold of, the better were considered his chances for making a fortune, or rather the greater the fortune he might be supposed to have already secured. Unacquainted with the character of silver-bearing ores and lodes, without the skill or means for making assays, every reef of rocks met with and sometimes even the boulders found on top of the ground were located under some fitting name significant of their supposed great wealth, the sole ambition of these prospecting "tramps" being the securing of numerous "feet," as attested by the certificate of the accommodating recorder.

What Led to this Extreme Activity, and Tended to Foster These Illusory Notions

Of the vast mineral resources of the country, was the fact that the Comstock lode, which was made the standard for measuring the probable value of all others, was in no wise remarkable either in its surface dimensions or other external features. Its outcrop was neither large nor continuous, while the rich ores had as yet shown themselves at only two points along it. In the vicinity were other ledges to all outward appearance equally valuable; the Virginia, lying only a few hundred feet further west, presenting even bolder croppings at many places along it. The prospector found, in fact, fully as good looking ledges as this at Gold Hill and Virginia City wherever he went, wherefore it was not at all strange that he should, in his ignorance and inexperience, have attached to them an equal prospective value, and eagerly sought to secure as many of them as possible, an end that could be attained without much trouble or cost; and so the whole country was rapidly run over and locations made everywhere. It was unfortunate for the future of this industry that the business of silver mining amongst our people should have been inaugurated by the discovery of such an exceptionally rich lode as the Comstock proved to be, inasmuch as it led to an undue excitement at first, whereby both the miner and the general public were betrayed into all kinds of follies and prevented afterwards from exercising that degree of patience, industry and economy that would otherwise have been observed, rendering the business, most likely, a success from the start. Had we commenced on a lode carrying a low grade ore, we should have escaped the unhealthy excitement that ensued, while we would have been more apt to apply our labor and means with diligence and care in opening up the mines, satisfied to work hard and reap a moderate return. As it was, with our ideas inflated and our expectations exalted to the highest pitch, we commenced building at the top, converting the business, as it were, into a pyramid standing on its apex instead of its base, hence much of the disappointment and disaster that followed.

Developments Delayed, and Disappointment All Round.

The winter of 1859-60 set in early and proved to be a long and severe one, wherefore but little work was done on any of the numerous ledges taken up the fall before. The cold and stormy weather continued with snow and sleet quite into the summer, in the early part of which the Indian war broke out, still further delaying the work that would otherwise have been done and postponing it for another year. Not until the spring of 1861, therefore, did the business of active development begin, after which another year was required to prosecute this work to anything like determinate results, and when

these were reached they generally turned out to be unsatisfactory. Then came a reaction and for a time "feet" were in disfavor, till the glowing accounts from Reese river again revived the furor, and the business of prospecting for and locating claims became as active as ever, to be followed in a year or two by another decade, and this by the White Pine stampede, which without ending may justly be considered the culminating point in these vein mining excitements, Schell creek, Panamint and latest and least of all, Coso and Darwin, having all been movements of a milder type.

Nevada County Prospects.

The mining interests of Nevada county have been attracting much more attention of late than for some years. That county takes the lead in the mining industry of California. Prospecting and mining is prosecuted with good success, and a good many men have gone there to enter the field. The local papers say that the companies are now able to raise capital right at home to work promising enterprises. Several old claims have been started up again which were abandoned some time since. We are glad to see this spirit manifested anywhere in California, feeling sure that those who invest in home properties, economically managed, will do better with their money than by risking it in the stocks of mines of which they know nothing, and which are oftener run in the interests of the stock market than for legitimate mining. Nevada county has many good mines, and with home capital and good management they can be made to pay better than the ordinary run of mines.

A correspondent tells us in a letter written from Nevada City that quartz mining in that section of country promises well for the coming summer. Among the most promising of new developments may be mentioned that of the New England, under the superintendence of Mr. Lockhart. The first crushing averaged over \$60 per ton. They are now crushing again with even better prospects. The Mountaineer mine, situated about 1,000 feet from the Nevada and Providence mines, is looking well and is taking out better rock now than for some time past, the last crushing paying \$25 per ton. Our correspondent says further: in a back issue of the Press I notice a statement in regard to the contract let by the Mountaineer company; it was stated that the contract was let to John Stiles and Thomas Miner, this was incorrect, it was let to John Stiles and Wm. Dower to take out 500 tons of rock. They have sold their contract and the parties buying it are going down under the tunnel level and getting out very fine rock. The Providence company will start up their new works with full capacity this week. The Spanish mine is looking well and hauling ore to the Oriental mill for reduction. The mill gives the most satisfactory results of any in this section and is owned by Mr. Kitts. The Deadwood is looking well and has been incorporated.

Hale & Norcross.

The annual meeting of the Hale & Norcross mining company was held on Wednesday, when the following Board of Trustees was elected: George Congdon (President), John G. Congdon (Vice President), Solomon Heydenfeldt (Counsel), Wm. S. O'Brien, R. H. Follis, Con. O'Connor. Afterwards, Joel F. Lightner was re-elected Secretary and Philip Deidesheimer Superintendent.

James G. Fair, the retiring Superintendent, submitted the following report: Since my last report the energies of the Hale & Norcross company have been applied to the freeing of the mine of water, then nearly up to the 1700-foot level. During the year, heavy and expensive machinery has been erected, which is now in successful operation, and the water has been lowered 54 feet below the 1900-foot level, with the prospect of the mine being entirely freed from overflow in a short time, as the combined pumps of the Savage and Hale & Norcross have no difficulty in lowering it as against its present pressure or head; showing that its principal source of supply has been lessened. The drift connecting the Savage and the Hale & Norcross, on the 1900-foot level, has been cleaned out and repaired its entire length, which gives a free and perfect ventilation at that depth, and will facilitate the work of opening the mine below that point. With the mine free from water prospecting in the 2200-foot level and in the winze below that level will be resumed, where the work done over a year ago promised a change for the better.

Joel F. Lightner, Secretary, submitted a report showing the receipts of the year to have been \$579,725.78, the main items of which were: From assessments, \$567,890 (which includes a balance of \$78,550 from assessment No. 49, of the previous fiscal year); miscellaneous sources, \$3,695.52; Nevada Bank, \$7,537.34. The principal items of the disbursements were: Construction account, \$283,048.31; mine account, \$131,714.30; Chollar-Norcross-Savage shaft, \$86,110.04; general expenses, taxes and minor items making up the balance of expenses, which amounted to \$579,724.89.

At the Exchequer mill, Alpine county, the O'Hara Champion furnace is finished and running. There are about 2,000 tons of ore ready for working. The furnace is expected to solve the question of working the rebellious ores of the Exchequer mine.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

VALVE FOR STEAM ENGINES. Samuel H. Wheeler, San Francisco. The object of this invention is to give such a distribution of steam or other fluid in reciprocating engines that the motions of the main piston of the engine shall correspond both in extent and time of movement with the motion impressed upon the distribution valve of the engine; the distribution valve being operated by any means independent of the main engine, as, for instance, by manual force or by an auxiliary or supplemental engine. This is accomplished by placing a movable seat under the distribution valve and connecting it to the main piston in such a manner that when the motion of the distribution valve upon this seat gives steam behind the main piston, the motion thus impressed upon the piston will be communicated to the movable seat and will cause it so to move under the distribution valve as to cut off the steam supply. By this means the motions of the main piston are made to correspond with those of the distribution valve, the piston moving while the valve is in motion and coming to rest when the valve is arrested. This valve motion, while it has for its object the regulation of the motion of the main piston of the engine to correspond with the motion of the piston of a supplemental engine or the hand of an operator, as in the United States letters patent issued to the same inventor, July 25th, 1876, and in those issued to H. Davey, September 7th, 1875, has this difference from them; that in this invention the distribution valve always makes its full stroke forward and backward during the continuous working of the engine, while, by the combination described in those patents the valve is constrained by the motion of the main piston to remain very near to its middle position. Mr. Wheeler, therefore, claims that in this invention, on account of the combination of parts that he uses in it, the motion of the main piston corresponds, both in extent and time, with the motion impressed upon the main valve. The drawings accompanying Mr. Wheeler's patent illustrate the application of his invention to a pair of rotative engines designed to be used on a foundry crane. In this instance motion is given to the distribution valves through the medium of a shaft and eccentric operated by a crank handle, the crank handle being turned by the attendant; the engine shaft will receive a corresponding motion, and will continue its motion, stop or reverse, just as the hand of the attendant may be moved. This arrangement Mr. Wheeler considers to be particularly well adapted to this and similar purposes, as for instance, steering gear for ships, etc., since the motion of the engine is under complete control.

BED BOTTOM.—Robt. M. Grunwell and Casey Newhouse, Santa Rosa, Sonoma Co. This invention relates to that class of bed bottoms in which an upper and lower frame is used. The improvements relate, first, to an improved spring connector for sustaining the upper frame in its proper relation to the lower frame; secondly, to an adjustable strap connector for adjusting the tension of the entire series of the springs in the bed in order to convert the bed into a hard or soft bed as desired; thirdly, to an improved arrangement for attaching the upper ends of the outside or border spring to the upper frame; fourthly, an improvement in forming and connecting the upper rings of spiral springs; and, lastly, in the arrangement of the springs so that the number of springs in the bed can be increased in a very simple manner.

VALVE AND CUT-OFF.—John C. H. Stat, S. F. This is an improved balance slide valve and drop cut-off, and it consists mainly in a novel construction of a hollow valve balance by receiving the steam to its interior and, provided with cut-off plates which regulate the steam ports. These plates are operated by means of exterior and interior levers, and a peculiar arrangement of angular plates over which the end of the exterior lever moves alternately, so as to form a drop cut-off, which is caused to act instantly by means of a steam cushion or spring. The point at which the steam is cut off is regulated by means of an inclined plane or other device, which is operated by the governor and adjusts the angular plates in proportion to the speed of the engine.

RE-SAWING MACHINE.—Samuel Putnam, Emigrant Gap, Placer Co. This invention relates to an improved machine for accomplishing that class of work known as re-sawing, in which ordinary boards such as are turned out by saw-mills are split into thin boards for special uses, such as for making boxes, etc. The improved machine is adapted for accomplishing the work with a circular saw and the operation is automatic and continuous; this is accomplished by a combination of devices.

MINING COMMITTEE.—The Committee on Mines and Mining in the U. S. Senate is composed of the following: Sharon, Chairman; Chaffee, Kirkwood, Plumb, Hereford, Cook and Hill.

Ancient Ruins in Colorado and Utah.

In our last two numbers we have devoted considerable space to a description of the very interesting ruins found in Colorado and Utah by the Hayden survey party, and now conclude the subject with a further description of some of the most curious of the structures found in the region referred to. While going down the canyon of the Mancos, one of the party discovered, far up the cliff, what appeared to be a house with a square wall, and apertures indicating two stories, but so far up that only the very sharpest eyes could define anything satisfactorily. They had no field-glass with them and to this fact is probably due the reason that they had not seen others during the day on the same line; for there is no doubt that ruins exist throughout the entire length of the canyon far above and out of the reach of ordinary observation. Cedar and pines also grow thickly along the ledge upon which they are built, hiding completely anything behind them.

The discovery of this house, so far above anything heretofore seen, inspired them immediately

tying it to a tree, the others easily ascended.

The house shown in Fig. 12, on this page, stood upon a narrow ledge which formed the floor and was overhung by the rocks of the cliff. The depth of this ledge was about ten feet by 20 in length, and the vertical space between ledge and overhanging rock some 15 feet. The house occupied the left hand half, the rest being reserved as a sort of esplanade, a small portion of the wall remaining, which cut it off from the narrow ledge running beyond. The edges of the ledge upon which the house stood were rounded off so that its outside wall had to be built upon an incline of about 45°. The esplanade, too, had been extended by three abutments, built out flush with the walls of the house upon the steeply inclined slope and giving support probably to a balustrade.

The house itself, perched up in its little crevice like a swallow's nest, consisted of two stories, with a total height of about 12 feet, leaving a space of two or three feet between the tops of the walls and the overhanging rock. The ground plan showed a front room about six by nine feet in dimensions, and back of it two smaller ones, the face of the rock forming their back walls. These were each about five by seven feet square. The cedar beams which had divided the house into two floors were gone, ex-

ANCIENT RUINS IN COLORADO AND UTAH.

with an ambition to scale the high and explore it, although night was drawing on. All hands started up, but only two persevered to the end. The first 500 feet of ascent was over a long steep slope of debris, overgrown with cedar. Then came alternate perpendiculars and slopes. Immediately below the house was a nearly perpendicular ascent of 100 feet, which they were only able to surmount by finding cracks and crevices into which the fingers and toes could be inserted. From the little ledges occasionally found, and by stepping upon each other's shoulders, and grasping tufts of yucca, one would draw himself up to another shelf, and then, by letting down a stick of cedar, or a hand, would assist the other up. Soon they reached a smooth steep slope, in which there had been cut a series of steps, now weathered away into a series of undulating hummocks, by which it was easy to ascend, but without them almost an impossibility. Another short, steep slope and they were under the ledge upon which was the house. As it was now quite dark they returned, waited and ascended again. They hauled the boxes containing the camera and chemicals up the precipice with ropes; one man was pushed up ahead, over the worst place with the rope, and

cept a few splintered pieces in the wall. In the lower front room are two apertures, one serving as a door and the other, up near the ceiling, as an outlook over the canyon beneath. In the upper story a window corresponding in size, shape and position to the door below, commands an extended view down the canyon. Directly opposite this window is a similar one opening into a large reservoir or cistern, the upper walls of which come nearly to the top of the window. From the window and extending down to the bottom of the reservoir are a series of cedar pegs about a foot apart, enabling the occupants to easily reach the bottom.

The entire construction of this little human eyrie displays wonderful ingenuity, perseverance and some taste. Perpendiculars are well regarded, and angles carefully squared. Stones of the outer room or front were squared and carefully faced, but were not laid in regular courses as they were not uniform in size. About the corner of the windows considerable care and judgment were evident in the overlapping of the joints so that all was held firmly together. The back portion is built of rough stone firmly cemented. The mortar is compact and hard; a grayish white, not resembling lime but cracking

all over. All the interstices between the larger stones were carefully chinked in with small chips of the same material. The partitions were of the same character as the walls outside, having somewhat the appearance of having been rubbed down smooth after they were laid. Most peculiar, however, is the dressing of the walls of the upper and lower front rooms, both being plastered with a thin layer of firm adobe cement of about an eighth of an inch in thickness and colored a deep maroon red, with a dingy white band about eight inches in breadth running around floor, sides and ceiling. No signs of ornamentation other than the band alluded to were visible. The floor had been evened up with cement similar to that used in the walls.

The party prospected the ledge upon which this house was found and came upon the ruins of half a dozen houses of smaller size. One little house in particular, at the extremity of the ledge, was especially unique in the daring of its site, filling the mind with amazement at the temerity of the builders and the extremity to which they must have been pushed.

The party continued on down the canyon, the features being much alike. At some distance down, however, the scenery changes, the highest level of the mesa coming forward and towering over the valley with a thousand feet of altitude; the bottom lands widening out to a half and three-quarters of a mile in breadth. Everything is dry, dusty and barren, the stream itself losing in volume and becoming more turbid. Figure 13 represents in outline the characteristics of the canyon or valley at this point. In the high bluff on the right hand of the sketch are many curious and unique habitations. The position of these houses can be seen in Fig. 13, in dark heavy lines near the summit, just above the most precipitous portion of the bluff, generally at a height of from 600 to 800 feet above the level of the canyon. The house shown in Fig. 12 is in the same sort of a position. Fig. 14 shows a sketch of some of the larger of the ruins which we have described.

Aside from the interest attaching to the ruins themselves there are thrown around them the romance and charm of legendary association. The story runs thus, as given to Mr. Jackson's party by the guide: Formerly the aborigines inhabited all this country. They had been over as far west as the headwaters of the San Juan, as far north as the Rio Dolores, west some distance into Utah and south and southwest throughout Arizona and on down into Mexico. They had lived there from time immemorial. They cultivated the valley, fashioned whatever tools and utensils they needed very neatly and handsomely out of clay and wood and stone, not knowing any of the useful metals; built their homes and kept their flocks and herds in the fertile river bottoms and worshipped the sun. About 1,000 years ago, however, they were visited by savage strangers from the north, whom they treated hospitably. Soon these visits became more frequent and annoying. Then their troublesome neighbors—ancestors of the present Utes—began to forage upon them and, at last, to massacre them and to devastate their farms; so, to save their lives at least, they built houses high upon the cliffs, where they could store food and hide away till the raiders left. But one summer the invaders did not go back to the mountains, as the people expected, but brought their families with them and settled down. So, driven from their homes and land, starving in their little niches in the high cliffs, they could only steal away during the night and wander across the cheerless uplands. At the canyon of the Hovenweep, Utah, they halted and probably found friends, for the rocks and caves are full of the nests of these human wrens and swallows. Here they collected, erected stone fortifications and watch-towers, dug reservoirs in the rocks to hold a supply of water and once more stood at bay. Their foes came and for one long month fought and were beaten back, and returned day after day to the attack as merciless and inevitable as the tide. Meanwhile, the families of the defenders were evacuating and moving south, and bravely did their protectors shield them till they were safely 100 miles away. But the narrative tells us that the hollows of the rocks were filled to the brim with the mingled blood of besiegers and besieged, and red veins of it ran into the canyon. It was such a victory as they could not afford to get again, and they were glad to follow their wives and little ones to the south. There, in the deserts of Arizona, on well-nigh unapproachable and isolated bluffs, they built new towns, and a few descendants—the Moquis—live in them to this day, preserving more carefully and purely the history and veneration of their forefathers than their skill and wisdom. It was from one of their old men that this traditional sketch was obtained. The floor, of nearly white sandstone, upon which the butte stands, is stained in gory streaks and blotches by the action of an iron constituent in the rocks of another portion of the adjoining bluffs, and this feature gives rise, probably, to the legend. Half a mile back, or north, from this historic butte, is a group of small cave houses. A long bluff line, about 100 feet in height, of alternating bands of red and white sandstone, has, along a line of its upper strata, quite a number of shallow caves, in which are snug little retreats, securely walled in, the masonry perfect and substantial. Along the top of the bluff are traces of old walls, but now well-nigh obliterated.

SOME of the principal coal mines of Pennsylvania, after being idle for many months, have resumed work again.

The Marble Range of Calaveras County.

A correspondent of the *Calaveras Chronicle* says: I believe it is not generally known that there is in the county of Calaveras immense deposits of that peculiar formation of limestone known as marble. Thinking that a description of the different localities where it exists may be interesting, I propose briefly describing them, hoping that it may attract the attention of those interested in the development of the natural resources of the Pacific slope to the fact that there is in the marble quarries of this county an opportunity to invest capital that would increase in value for all time to come, for I consider the deposits of marble in this county actually inexhaustible. The vast quantity that is exposed to view upon the surface, added to that which is met with in the various mining operations under ground where there are no indications of it upon the surface, goes to confirm me in the belief that the profitable quarrying of marble will, at no distant day, be one of the leading interests of this county. The great variety of marble in color and fineness of grain, indicates that marble can be obtained here for any and every purpose for which it is or may be required. The large amount that lies in solid ledges and in large boulders—not under the surface of the earth but on and above the surface—offers facilities for quarrying at a much less expense than can be done at any of the marble quarries in the Eastern States.

Before entering upon a detailed account of the marble localities in this county I propose giving a short account of what has been done towards developing the marble interest in Tuolumne county, as the same ledge of marble that runs through Calaveras extends across that county. What has been done there to open the only quarry that has been worked upon the vein will indicate what will be the cost of opening 100 quarries that might be opened in the two counties. About 16 years ago one of Devine's marble cutters, of Sacramento county, came into this county prospecting for "California marble" with which to build the monument to the memory of Broderick. Devine left his mark on many of the ledges in this county. At several places he quarried and worked into shape large blocks to prove the quality of the marble. Crossing the Stanislaus river into Tuolumne county he found better facilities for getting the marble to market by reason of the great number of teams engaged in hauling freight from Stockton to Columbia. They would take the marble for the down trip at a comparatively low price.

He decided to open a quarry on that side of the river, and selected the site where the marble known as "Columbia marble" is now quarried. It is about half way from Abbey ferry to Gold Spring, some three miles west of Columbia. The quarry is now owned by John Grant, of San Francisco, by whose energy and perseverance the marble has been brought into demand. A small mill has been erected, where the marble is sawed into slabs and sent to San Francisco. Also many blocks are sent there, too, to be sawed by the marble mills in that city. From the day that Mr. Grant took hold of that quarry he has had the whole marble interest of the world to contend with. The great distance of the quarry from water carriage necessitating a long and expensive hauling by team, together with the continued opposition of marble dealers and workers in San Francisco, put obstacles in the way of its introduction that would have deterred any one possessing less energy and perseverance than Mr. Grant. But he has triumphed over all opposition. The value of it is acknowledged by all. He has done the prospecting—those who may take hold of the business will reap the benefit of his expensive labor. It is due, perhaps, in a great measure to the late Mr. Ralston that the marble has been brought into demand to the extent that it has. He saw the value of it, and the necessity of encouraging its development. He contracted for a large quantity and used it in the construction of the Palace hotel. I have been told that \$10,000 was paid out before a block was sent to San Francisco. Large as that may appear it is but a small amount, in comparison to what it costs to open quarries in other places.

In an article on the marble of Rutland county, Vermont, by S. M. Dorr, he says, "it is not an unusual thing for a quarryman to spend \$60,000 in uncovering and preparing a quarry before finding blocks good enough to pay the expense of sawing." The mill at the quarry is built close alongside of the main ledge, on the south side of it. The work that has been done in opening the quarry is at the east end of the mill, extending about 75 feet from the mill, 100 feet south of the ledge, and about 20 feet below the surface. That depth was necessary to reach the bottom of a boulder that has occupied two seasons in quarrying. A plain statement is that the ground worked out, as the miners say, is 100 feet by 75 feet, and 20 feet deep. The solid ledge stands about 10 feet high, against the back of the mill, rising gradually for 500 feet until it is about 100 feet high above the mill. At the east end of the opening the solid ledge rises about 100 feet perpendicularly, and of all the marble that has been quarried in the 16 years not a block has been taken from the main ledge. It has been all taken from boulders measuring from 10 to 30 feet in diameter. It is said that when Governor Irwin vetoed the Oakdale and Columbia railroad bill he gave the Tuolumne delegation, as one of his reasons, "that the marble and lumber would soon be exhausted and then they would be worse off than they are

now." The Superintendent, Mr. McNamee, tells me that it will take two years more to work up the boulders between the mill and the solid ledge, so as to get a good face upon it. Now, Mr. Grant has a claim of 160 acres. If it will take 18 years to work out a space 100 feet square and 20 feet deep, how long will it take to work out the 160 acres?

Lake County Mines.

The *Lower Lake Bulletin*, in an article on the mineral resources of the county, speaks as follows of the

Sulphur Bank Property.

This mine is located in Lake county on the east bank of the east arm of Clear lake, and about 10 miles from the town of Lower Lake. It is perhaps one of the most remarkable deposits of cinnabar in the known world, being 1,800 feet long by 750 wide, and the lowest depth yet reached is probably 100 feet. The ore is better at this depth than at the surface. The assayer, Mr. M. J. Walsh, informs us that they had no means of ascertaining its thickness, but supposed it to be several hundred feet, and that the deeper they dig the higher the grade of ore, and all the cinnabar found thus far contains a greater quantity of sulphur than any other known, but notwithstanding this fact, it has yielded a large per cent. of silver from the surface.

The mine is worked by large open cuts, and quarried direct into carts—thus doing away with all the expensive machinery needed in other quicksilver mines.

Conveniences.

Not only is the Sulphur Bank fabulously rich, but has conveniences which no other mine possesses. Near by, between four and five miles, are five limestone quarries, to which there are fine wagon roads. The rock is hauled and burnt on the premises for lime. All the brick needed is also made on the grounds.

The Works

Are extensive—consisting of six furnaces, five of which, of the Lightner patent, are for fine ores, the other is for coarse ores, and is made after the Knox & Osborn patent. They have just finished another, different in construction from either one of above, for the purpose of burning soots, patented by the superintendent, Mr. Lightner. There are three benches of retorts, and when they will have completed all the works now in course of construction, they will be able to reduce 100 tons of ore per day. The company have just finished the building of a large flume four by four, and 1,500 feet long. Also six rotary driers for the purpose of drying the ore before it is put in the furnaces. The company have about 4,000 acres of land, and it is used for grazing and farming purposes, and extends along the water front some 10 miles. An extra large steam tank-pump of the Hooker patent, with a five-inch pipe 750 feet long, which forces the water from the lake to 15 large tanks above the works on the hill, has just been put up. This supplies all the water needed, which is conducted to all parts of the mine through pipes. The number of men employed to carry on this extensive mining operation is 175, most of whom are Chinamen, and do the principal part of the work, with white men for overseers. The Sulphur Bank produces from 900 to 1,000 flasks per month, and when all the works are fully completed, the product will be largely increased. One good feature, which is worth mentioning, is that no bar-rooms, or loafers, are allowed on or about the premises. The officers and owners of this mine are: President, John Parrott; Vice-President, J. W. Burling; Secretary and Treasurer, Lucian Herman. Directors—John Parrott, Tiburcio Parrott, J. W. Burling, H. L. Lightner, W. Burling. Superintendent—H. L. Lightner; Assistant Superintendent, J. E. Tucker; Assayer, M. J. Walsh.

Abbott Mine.

The Abbott quicksilver mining company, located about 10 miles southeast of town, near Morgan valley, is prospecting well. A tunnel some 300 feet long, which the company has just run, struck rich paying ore of about three per cent. grade. The ledge runs northeast and southwest. Plenty of wood and water, and easy of access.

Manzanita Gold Mine.

This mine, located on Sulphur creek, Colusa county, 23 miles from this town, is said to be one of the best in the Coast range. It has been prospected for years, and is owned by a San Francisco company. Recently a 10-stamp mill was erected on the mine, and is said to be paying well. Placer mines have been discovered in the neighborhood, and quite an excitement prevails thereabouts.

Sulphur Bank, No. 2.

The Sulphur Bank No. 2, 10 miles from Lower Lake, on the Lakeport road, shows a splendid prospect. A tunnel some 300 feet long has been run, and a large deposit of high graded ore found.

ERICH G. GAERTNER, MINING ENGINEER.

All classes of mining properties reported on, consultations had on reduction of ores of all descriptions, plans for furnaces and reduction works furnished, and the construction of them superintended. Ore tests made at the office.

Steam Engines & Boilers.

NEW AND SECOND-HAND.

One Patent Straw-Burning, Portable Engine, (new,) fire box boiler, the best Portable Engine on the coast; built by Ransom, Sims & Head, Ipswich, England.

One Steam Fire Engine, second-hand, in excellent condition, with 200 feet leather hose, very cheap, just the thing for a small town. Button & Blake, builders, Waterford, N. Y.

One second-hand Stationary Engine, 14x30 inches, link motion, with or without hoist gear.

One second-hand Stationary Engine, 8x20 inch, with or without hoist gear.

One Upright Boiler, Horizontal Engine on wheels, Eastern make, 7x12.

One Upright Boiler, Horizontal Engine, San Francisco make, 6x12.

One small Stationary Engine, 3½x7 inch.

One Steam Boiler, 40 inches diameter, 16 feet long.

One 8x10 Straw-Burning Portable Engine.

One Stationary Engine, 8x16, and Boiler, with pump heater, fire front and smoke-stack, complete.

One Traction Engine, three wheels, rubber tires, double cylinder, 6x10 inch; Thompson's patent, D. D. Williamson, builder, New Jersey.

Various other second-hand Engines and Boilers for sale cheap.

ARITHMETIC MADE EASY.

ROPP'S

EASY CALCULATOR

Is a new publication that must prove of incalculable benefit to Farmers, Mechanics and Business Men. It is so rapid and original as to startle the most scholarly, and yet so simple and practical that the most illiterate in figures can instantaneously become his own accountant. It enables thousands to accomplish in a minute what they could not learn to calculate in many months.

The first part contains an entirely new system of tables, which show at a glance the exact value of all kinds of Grain, Stock, Hay, Coal, Lumber, Merchandise, etc., from one pound up to a car load, and for any price that the market is likely to reach; the interest on any sum for any time at 6, 7, 8 and 10 per cent.; correct measurement of all kinds of Lumber, Saw Logs, Cisterns, Tanks, Granaries, Bins, Wagon Beds, Corn Crib; a Time, Wages and many other valuable tables.

The second part is a practical arithmetic, and embodies a simple mathematical principle which enables any one familiar with the fundamental rules to become a lightning calculator; and by which over two-thirds of the figures and labor required by the ordinary methods, and fractions with their intricacies, are entirely avoided.

The work is nicely printed on fine tinted paper, is well and elegantly bound in pocket-book shape and is accompanied by a Silicate Slate, Memorandum and Pocket for papers. It is by far the most complete, comprehensive and convenient pocket manual ever published.

Price, bound in Fine English Cloth, \$1.00.

Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter, or receipted by express. Address

DEWEY & CO., San Francisco.

BLACK DIAMOND FILE WORKS.

G. & H. BARNETT,

Manufacturers of Files of every Description,

Nos 39, 41 and 43 Richmond street,

PHILADELPHIA, PA.

Sold by all the principal hardware stores on the Pacific Coast. LINFORTH, KELLOGG & CO., General Agents for the Pacific Coast.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

TUBBS & CO.,

611 and 613 Front Street, San Francisco.

Machinery.

The Gardner Automatic Governor.

When all others fail, buy a "Gardner." We have all sizes of these celebrated Steam Governors on hand at all times.

BERRY & PLACE,

Selling Agents for the Pacific States,
Cor. Market & Fremont Sts., S. F.

The Ingersoll Rock Drill

Is Extensively Used in the East and

TAKES THE PLACE OF ALL OTHERS,

Wherever introduced, because it can be run with less power, labor and repairs, and do more work than any other Drill in the market. It has but few parts, is easily handled, being light, and has AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

320 Sansome Street

(Room 10.)

THE O'HARRA
CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at \$30.....	\$12.00
Two brenen at \$4.....	8.00
1,500 lbs of salt at 14c.....	22.50
Wear of shoes and power.....	1.50

Cost for 15 tons.....\$44.00
Cost for one ton.....2.93 1/3

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,
Reno, Nevada.

A NEW YEAR'S GIFT TO SUBSCRIBERS

A \$5 NEW YEAR'S GIFT
GIVEN AWAY!

To Every Subscriber of This Paper!

Consisting of the beautiful and valuable Steel Engraving, entitled

"CHRIST IN THE TEMPLE!"

In an American edition, issued by W. W. Bostwick & Co., Publishers, 177 and 179 West Fourth Street, Cincinnati, O., and furnished to every

SUBSCRIBER OF THIS PAPER FREE.

The retail price of the English edition of this Engraving is \$12.00 PER COPY. It illustrates one of the most remarkable incidents in the life time of our Savior. The subject is taken from Luke, Second Chapter, 46, 47, 48, 49, and 50th Verses. Its size is three feet long and two feet wide, and has over

30 FIGURES REPRESENTED.

It is the best Premium ever given away. We have made arrangements with W. W. Bostwick & Co. to supply the subscribers of this paper with the valuable and appropriate Engraving of "Christ in the Temple" as a New Year's Gift.

Subscribers will therefore please cut out the following Subscribers' Certificate and send it to W. W. Bostwick & Co., Publishers, 177 and 179 West Fourth Street, Cincinnati, O., for redemption, together with 25 cents to pay for postage, wrapping, roller, and mounting the Engraving.

Cut Out this Subscribers' Certificate. It is worth \$5.00.

SUBSCRIBERS' CERTIFICATE.

On receipt of this Subscribers' Certificate, together with 25 cents to pay for postage, roller, wrapping, and mounting, we will send the beautiful Engraving, three feet long and two feet wide, entitled

"CHRIST IN THE TEMPLE."

To every subscriber of this paper, by mail, postpaid. Send for Engraving at once, stating name in full, P. O. address, county, and State. Address all orders to
W. W. BOSTWICK CO., PUBLISHERS,
177 & 179 W. Fourth St., Cincinnati, O.

None but subscribers of this paper will be allowed this New Year's Premium Gift, and all orders must be accompanied with above Subscribers' Certificate, which be sure to cut out and send with directions for mailing to

W. W. BOSTWICK & CO., PUBLISHERS,
177 and 179 West Fourth Street, CINCINNATI, O.

Continued from page 165.

brought to some point as near as possible to the ground for the reduction of the ore.

Upon the Silver Glance, more familiarly known as the Johnson mine, there is a force of men stopping for ore. A large supply of charcoal has been laid in and the furnace was to be started up for its second run last Monday. The last run resulted in the production of 16 tons of bullion, the aggregate value of which amounted to over \$40,000. The Silver Glance mining company is a Boston company, and has gone to work in earnest, paying greenbacks for everything it gets and giving satisfaction to everybody. It now employs a force of 40 men.

COL. DAVE BUEL has left Mohave county and gone to Utah to engage in mining there.

In Cedar valley work is being done upon the Arnold ledge by Messrs. Orr & Jerome, and the Kimball Bros., who are at work on the original location and are getting out some high-grade ore, which will go about \$600 per ton, which they are sacking and sending to San Francisco.

DIFFERENT DISTRICTS.—William Jackson and R. A. Arnold have been on an extended hunting and prospecting trip. They left here in December, in company with R. H. Marn, and went to the Black Canyon country, where they found an excellent mineral region, and from thence to Phoenix and then to Globe City. At Globe and in the other mining districts of Pinal county they found quite a thriving community of miners, all of whom seemed to be sanguine as to the prospects of the country. Arnold and Jackson both agree in saying that the world cannot beat some of the Pinal mines for the richness of their ores. From thence they went to the Aravaipa country in Pima county, and they say that the mines in Guizut district have more indications of being true fissure veins than any they saw on the trip. The ores are low grade, but the ledges are large and well defined, having good walls and being traceable for miles. Several Mexican arastras are running in Globe City.

PECK.—Arizona *Enterprise*, Feb. 24: In the Peck district things are now booming. Work is being steadily done in the Peck mine, which is showing splendidly. In the main tunnel north from the shaft, some of the richest ore yet taken from the mine is being extracted. Old miners, familiar with the leading mines on the coast, admit that they have rarely seen it equaled and never excelled. And there is lots of it. A tunnel has been started on the north side of the hill, and will be put through, as fast as men and giant powder can do it, until it reaches the main shaft. The completion of this tunnel will open a large section of ground and give greater facilities for the extraction of ore. The water in the main shaft is increasing, though no difficulty is yet experienced in keeping it from hindering work.

TURKEY CREEK.—Our miners are all hard at work in this district and the different claims are all looking well. The Goodwin is producing some very rich ore. The Trinity, owned by Simmons, Hall & Co., has reached a depth of 25 feet, showing in the bottom of the shaft, a vein two feet thick. Assorted ore from this mine gives a yield all the way from \$500 to \$1,500 per ton. There are three veins in this location, which, from their general course, eventually come together. At present the work is confined to one. It is the intention, however, to commence on the others in a short time. The smelter at this place, owned by Rouse & Munson, will shortly be started up. They have let a contract for a large quantity of charcoal, and men are at work burning it.

BRADSHAW.—From Bradshaw district I learn of active operations all over the district. The expected early arrival of C. A. Luke's mill has inspired everybody with new hope, and all hands have started to extract ore and be prepared to have it reduced when the mill is set up.

Colorado.

ORE MARKET.—Colorado *Miner*, March 10: One of the most encouraging features of this camp is that the facilities for selling every grade of ore that can be mined are unequalled by any other locality in the State. Low grade stuffs find ready sale at the various concentrating works at living figures. High-grade ore is eagerly sought for by all dealers, and brings prices that would surprise the denizens of slow-going camps, where there is no competition and but a little capital invested in the business. Here no one need stop work for want of a market for his product. Buyers are ready and have plenty of money.

THE DIAMOND TUNNEL.—After undergoing a thorough repairing of ventilating machinery, timbering and extending of tramming facilities, the Diamond tunnel has started up work with unusual activity. This tunnel is now in splendid condition, and accommodating a large number of lease workings, from which the company will in a short time realize a good profit. The tunnel is being driven ahead by a large force, on a contract, to the intersection of the Dives-Pelican, Cory City and other lodes, and there are four lodes besides the Baxter now being worked through the tunnel. Superintendent J. A. Fish has applications for leases nearly every day, and is kept quite busy.

THE BURLEIGH TUNNEL.—In the general revival that is going on in the district, this noted tunnel is coming to its full measure of praise. Under the management of Col. Ivers Phillips, Superintendent, it is being driven forward rapidly; it is already in a distance of over 2,000 feet, and is going along into the heart of the mountain at a very satisfactory rate of progress. It is seven feet high by eight feet wide. Two of the Burleigh improved drills have been put at work in the heading. Mr. John Green has charge of the heading, and Mr. C. N. Loring has charge, under the Superintendent. In the lode now worked there is from 15 inches to three feet of solid mineral, 65% lead. The first-class is shipping ore, the remainder sold to concentrating works. A drift has been run 200 feet west of the tunnel. In the west workings there are 14 men employed, in the east, two. Outside, in the tunnel, there are 19 men employed.

Idaho.

THE MINES.—Owyhee *Advertiser*, March 10: The outlook for the coming season in Owyhee is still somewhat mystified, and there is a feeling of uncertainty regarding future prospects, in consequence of the large number of mining suits to be decided here within the coming three months. In some instances there will be a change of ownership in the mines, many of which will be worked only on a small scale during the summer. There are reports that the companies below, interested in some of the leading mines, will not allow their valuable property here to go by default, and will take steps soon to adjust the claims and renew operations. It would, unquestionably, be for the interest of the capitalists having something at stake here to take this course. Our mines cannot be worked successfully on a small scale. Local capital is insufficient to meet the requirements of the times. Work these mines on a small scale commensurate with their merits, and work them honestly, and there are no better investments anywhere in the shape of mining propositions. Immense sums of money have already been spent in building valuable hoisting works over these mines, and those interested will make a great mistake if they allow such valuable property to be sacrificed. The limited work that has been performed on these mines during the past few months was attended with very good results, in so far as the quality of the ore taken out is concerned. There is a mine on War Eagle mountain but what will pay handsomely if judiciously worked, and all our old miners left here are fully convinced of the truth of this, and will not be slow to take advantage of any emergency looking to the prospects of their being interested in property about to be sold. As the prospects of the prospects are progressing very favorably and the prospects are brightening every day. The Belle Peck is looking first-rate. There is a large force of men at work sinking the shaft and running levels. Work continues at the Potosi as usual. A considerable quantity of rock has been shipped to the Golden Chariot mill for crushing the past week. The developments at the Hidden Treasure ledge, Empire City, are still creating a great excitement. We learn that operations will soon be resumed at South Mountain, some new machinery being on the way there. At the Wagonator camp preparations are being made for a busy season. The quartz mill there will resume operations in a week or two.

Montana.

BUTTE.—New Northwest, March 7: One principal thing remains yet to be determined by practical workings in the camp—the character of ores below water level. Expert miners hold there is no reason why there should not be as good below as above water, and the copper leads worked have maintained or improved their value. But this matter will soon be solved, and if the result is favorable, it will create such a furor about Montana mines as has not yet been seen. Three-fourths of a mile north of town and lying within pistol shot of each other, are the Rainbow, Lexington and La Plina leads, now developed to water, each owned by those abundantly able to develop, and each ready to begin sinking in water. These three leads alone if they are worked and hold good as they appear now will support a town of 5,000 people. The four mills of the camp are all pounding ore and Judge Davis is reducing Lexington ore in mill at \$14 per ton, with his facilities for economical handling not yet complete. For all, we have never seen a more prosperous camp than Butte, or any with so evident a substantial basis. A few months more will work wonders in the mines.

Utah.

SALE.—Correspondent Salt Lake *Tribune*, March 3: The Live Yankee mine, in Bingham, was sold yesterday to a Michigan company for \$35,000. It is a property which has the reputation of being first-class, and in the hands of men from Michigan, who as a class have the most successfully managed Utah mines, it will doubtless prove a remunerative investment.

DUGWAY MINES.—Smith & Co., of Chicago, who have erected furnaces, own some of the best developed property in this district. Their Mayflower mine is down about 160 feet, laying bare a large body of ore, showing a true vein. The Commonwealth, owned by Clark & Co., of Dry canyon, is also producing some good ore, and work is being prosecuted vigorously. They have considerable ore out waiting for the smelter to commence work. The Alpey mine is down 40 feet, showing a vein of two feet of ore assaying 40 oz. of silver to the ton. About the first of April the furnaces erected by the Chicago company, will commence reducing ore, and Dugway will undoubtedly be one of the liveliest camps in the Territory. There are a number of prospects that are being developed, and promise valuable returns, and as soon as the smelters get to work, the district will swarm with hardy miners.

DRY CANYON MINES.—Cor. Salt Lake *Tribune*, March 10: The most reliable index to a wholesome revival of mining affairs is the fact that numerous new prospects are being vigorously worked. With due deference to the many valuable mines in the various districts of Utah, it is an established belief that the thoroughly tested mineral veins, lodes and deposits of this camp will ever be incorporated upon the roll of genuine merit as peerless. A sorted depth of 500 feet, the Desert is yielding such masses of ruby silver as, perhaps, have never before been known in the annals of mines. In consequence of the inclement weather, work on the horse tramway has been temporarily suspended. I am informed that this tramway will be extended around to Mahogany hill, to further facilitate the shipment of ore from the Queen of the Hills, Florida, Herschel and other mines located in that region of mineral wealth, making the circuit of the environs of Jacob City.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco.

HEMLOCK CONS. S. M. Co.—March 9th. Location: Nevada. Capital stock, \$10,000,000. Directors—B. F. Fish, William Whalen, J. J. Dolan, T. G. McLaren and S. E. Holcombe.

SAN FRANCISCO PAVEMENT CO.—March 10th. Object: To deal in patent pavements. Capital stock, \$100,000. Directors—James C. Truman, Charles M. Gilmore, George L. Edgar, Charles F. Howland, Charles S. Fitch.

GERMANIA CONS. G. & S. M. Co.—March 10th. Location: Washington and Prince Edward mines, Sierra county, Cal. Capital stock, \$300,000. Directors—H. H. Flodo, H. W. Schurnd, Philip Wahlheim, Joseph Feld and Chas. Ruppel.

RICHMOND BASIN M. Co.—March 13th. Location: Globe district, Arizona. Capital stock, \$1,000,000. Directors—Franklin Lawton, A. P. Brynton, B. Lingley, E. P. Gaertner and A. G. Sialoff.

ORANGE M. Co.—March 13th. Location: Arizona. Trustees—John Burke, Martin Y. B. Gardiner, Daniel C. Van Nostrand, George W. Van Horenberg and John McCafferty. Officers—President, John Burke; Treasurer, Daniel C. Van Nostrand; Secretary, Henry S. Burke; Superintendent, John McCafferty.

NABOB M. Co.—March 13th. Location: Arizona. Capital stock, \$10,000,000. Directors—A. W. Blair, W. F. Peabody, C. H. Swain, W. H. Booth and W. H. Long.

Black Sands.

EDITORS PRESS:—Experiments with the black sands of this coast lead me to the belief that the gold contained in them is the result of the contact of gold-bearing sulphurets with the black sand. The gold being dissolved in the gold-bearing sulphurets by a weak solution of chlorine which exists in the bottom of our rivers, is brought into a solution and deposited on the black sand in a plated form. The plated part scales off and forms the float gold, which is so hard to save because it floats on the surface of the water.

The black sand is a metallic sand composed of different metals, and the plating of it with gold is easily accounted for by the same process by which copper or silver ornaments are plated with gold. They are put into a vessel containing a solution of gold and connected with an electric battery; the thickness of the plating is regulated by the strength of the gold solution and the battery. The earth acts as electric battery for the black sands.

One can form no idea of the millions of dollars of this fine scaly gold that is washed down our rivers and deposited on the sea sands on our coast. It cannot be saved by the wet process, for it swims on the surface of water; it must be saved by a dry process, where the friction of the sand breaks up all those scales into fine powder and allows it to settle through the sand and to deposit itself with the heaviest of the gold-bearing sands on the riffle of the machine. Having the heaviest of the gold-bearing sands concentrated, it will pay to leach the gold out with acids; and it will bring in use our large sulphur deposits.

JOHN VINCENT.

COLLAPSED.—The *Times* says the New York Exchange is about to close. The heaviest operators will be received in the old Board. Commissions will be raised again, but not so high as before.

Investment in California.

According to our own advices and the knowledge which we obtain from our interior exchanges, we are assured that there will be a very gratifying investment in California real estate during the coming spring time, on the part of our Eastern friends and comers from abroad. At the East the two great exciting events, the Centennial and the presidential election, will not this year restrain those contemplating change of residence. A winter of unusual severity has frozen into resolutions the desires for the luxury of our climate which have been growing during the late years in many minds. The depression in business of all kinds at the East, though now happily showing signs of dissolution, still has force enough to induce men to escape from it if they are able. These things, coupled with the general desirability which nearly all outsiders justly look upon as the characteristic of a California home, will tend to gain for us this year the coming of that class of citizens whom we most desire, men who come with hands and hearts for enterprises and pockets heavy enough to materialize their projects.

As we write of the tendency to investment in California we are reminded that one great barrier, which has held much Eastern capital aloof from us during the last decade, and longer, is now so reduced that it is an obstacle exceedingly small. We refer to the price of gold as compared with the greenback currency. This difference in the purchasing medium has restrained many from purchasing homes in this State. They had the disposition, but they could not submit to have the heads cut from their dollars by the money brokers. No one will ever know just how much this influence has militated against us, but the extent is considerable. Had it not been for this we have no doubt at all that the heavy immigration of 1874-5-6 would have been increased by thousands of men who would have come with the capital to work farms and start manufactories, and thus the great labor influx of those years would have been attended by a flow of capital to employ it and the return of many a discouraged laborer would have been obviated. The proof that the difference in the medium of exchange is now small, as compared with former years, may be seen in the daily reports of the price of gold in New York. It is also evident in the rumors which are sent abroad by the commercial newspapers of New York, that the black-hearted Gold Board, which has excited the country by its gold gambling, and more than once paralyzed industry by its "Black Friday" panics, is contemplating disincorporation from the fact that its occupation is nearly gone, and the opportunities for its scheming reduced to too narrow limits. These facts, coupled with the declared intent of the country to replace currency upon a specie basis, prove not only that the country is coming upon California ground in its financial ideas, but will open the way for coming upon California soil to many who have both the means and the inclination.

The mind starts itself when it begins to picture the possibilities for growth and progress in trade and production which this coast possesses. Our metropolis is pressing over the third line of hills toward the Pacific, and at the same time turns from its third hundred thousand of population into the coming hundreds of thousands. Our trade belts the world and has for a special possession the Asiatic and Oceanic millions. Our agriculture is just entering upon its true life, when system and economy shall rule, and the finer and more precious products shall replace the coarse and bulky; when England shall pay us more for 10 pounds of fruit or honey than for a cental of grain; when Australia and Ohio shall no longer sell wool at 60 cents to our 20 cents; when we shall turn back upon Europe her shower of raisins and floods of wine, and when the increased expenditure for preparing such productions shall support in comfort ten times our present agricultural laboring population. Such may be the result in many parts of our wide domain, when land and law monopolies shall be pushed aside, and when agricultural enterprise, now budding, shall bear its perfect fruit. Beyond this lies our field for manufacturing and for placing the stamp of utility upon the varied materials which we possess. When to the cost of production we shall add the manufacturer's profits, a population of skilled laborers will live upon them, and thus advance our agriculturists by increasing tenfold the home consumption of the products of the fields. All these things lie within easy reach of this coast, and when we remember that we have but lately turned the first quarter of a century of our permanent growth, it is plain to see that the doubling of our growth hitherto will realize all we have described, perhaps are the bright California baby, now in his cradle, casts his maiden vote.

It is easy to make friends with California. Her greetings, like her skies, are warm and winning. She asks but manly attributes and power to give them play and her rewards, like her future, will be great. We are glad to note that the passing months are bringing her nearer to those who admire her from afar, and that by the rules of value which exchanges regulate, the offerings which they will bring this year to establish themselves on her domain will have a power to purchase here nearer to that at which they were obtained in the States whence our new friends shall come.

Book Notices.

PROPERTIES OF CONTINUOUS BRIDGES.—This is a practical treatise on the properties of continuous bridges, by Chas. Bender, C. E., and constitutes No. 26 of Van Nostrand's Science Series. A paper by the author on the merits of continuous girders, was presented to the American Society of Civil Engineers last spring. In this paper the subject for the first time is found to be based without the use of higher calculus on one simple geometrical relation, forming the connecting link between single spans and continuous bridges. The same paper, increased with further data resulting from its discussion, is compiled into the short treatise of which we speak. The author says that the subject having never before been treated in this light, it is believed that railroad engineers will not unfavorably receive the results of special studies which have occupied a period of many years and which in the main are: that in addition to the sensitiveness of continuous bridges, the economy claimed for them does not exist either theoretically or practically in all instances in which the construction of properly designed compound single span trusses is not limited as to their depths. This book is for sale by Payot, Upham & Co.

ADVENTURES OF TOM SAWYER.—This is Mark Twain's last book, and is written in his peculiar and well known style. A paragraph from the preface will give an idea of the work. "Although my book is intended mainly for the entertainment of boys and girls, I hope it will not be shunned by men and women on that account, for part of my plan has been to try to pleasantly remind adults of what they once were themselves, and how they felt and thought and talked, and what queer enterprises they were sometimes engaged in." The book is handsomely bound, printed and illustrated. It is for sale by Roman.

General News Items.

CAPTAIN BOTTON has accomplished the feat of swimming from Naples to Capri. He was followed by several steamers bearing the American flag, and landed in presence of Victor Emanuel.

The first of the series of eight promenade vocal and instrumental concerts at the Mechanics' Pavilion, will take place on Saturday evening, March 24th. The orchestra will consist of 35 musicians under the direction of Mr. R. Herold.

The *Times's* Belgrade dispatch says: Reports reach Belgrade through trustworthy channels relative to immense armaments in the interior of Russia. It is asserted that 1,000,000 men will be in arms by the 16th of March. It is supposed that Russia has other purposes besides an attack on Turkey.

ADVICES from Peru confirm the report that Henry Meiggs has closed a contract with the Peruvian government for completing the Oroya railway and opening the Cerro de Pasco mines. The contract for introducing Chinese laborers into Peru is also confirmed, but it is doubtful if it can be carried out by the contractors.

A TELEGRAM from St. Petersburg says: "The past winter was the severest for many years. The thermometer on Sunday was nearly 20° below zero. A report comes from Pesth, in Austro-Hungary, that the railways are blocked and traffic stopped, and the snow is from three to twelve feet deep in the streets."

OBJECTIONS to the will of Commodore Vanderbilt have been filed by his son, Cornelius J. Vanderbilt. They aver that the document offered for probate is not the last will of the deceased; that it was not executed either by the testator or by witnesses at his request; that the deceased was not in sound mind when the document purported to have been signed; that it was procured by the fraud and undue influence of Wm. H. Vanderbilt; and that by a desire to concentrate his fortune in the person of Wm. H. Vanderbilt, the deceased had become incapacitated from making a fair will and disregarded his own children.

THE GRAND HOTEL OF THE NORTHWEST.—Chicago has the most imposing hotel in the United States, considering its outward magnitude and number and completeness of its interior departments. We speak of the Grand Pacific hotel. It is both the wonder and pride of its American guests. Its proprietors, John B. Drake & Co., are meeting with popular and permanent success in its management. We were more than satisfied with our recent stay at the Grand Pacific. We will quote some facts concerning the hotel as the best way to illustrate some of its grand features. It occupies a whole square, opposite the Federal buildings. Cost of elegant furniture, \$360,000; building, \$1,300,000. It is 130 feet high, 400 feet long. Contains 500 rooms. Main halls 12 feet wide and 325 feet in length. The parlors are 25x100 feet; grand dining room 130x60 feet; ladies' ordinary 60x60 feet square; ladies' promenade 130x30 feet; office rotunda 75x70 feet; exchange 100x60; kitchen 103x35 feet; billiard and bar room 80x80 feet. The arrangements for ventilation, prevention of fire and other provisions for safety and comfort seem to be perfect. It is worth a visit from all strangers who go to Chicago.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

PATENTS AND INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.)

FOR WEEK ENDING MARCH 9TH, 1877.

188,042. THILL COUPLING.—J. L. and W. E. Crist and G. H. Smith, Sacramento, Cal.
188,050. GRAIN-SEPARATOR.—H. Kelly, East Portland, Ore.
188,098. SHARP FURNACE FOR TREATING ORE.—N. D. Brett, Boulder, Col.
188,100. AWNING FOR BIRD CAGES.—S. P. Burton, S. F.
188,124. EXPLOSIVE COMPOUNDS.—J. Goetz, S. F.
188,126. SAWING MACHINE.—F. W. Krough, Tulare, Cal.
188,167. CAR-SKAT.—J. L. Mitchell, Pueblo, Col.
188,182. TOBACCO PRESS.—B. McGill, S. F.
188,191. HORSE COLLAR.—A. Rutherford, Walla Walla, W. T.
188,206. BUTTON FASTENING.—J. C. Teters, S. F.

DEVICES.

9,770. COMBINED MATCH-HOLDER AND FRICTION MAT.—P. L. Davis, S. F.
9,840. CENTER-PIECE.—S. Killet, S. F.

TRADE-MARKS.

4,434. TRAB.—Walker Bros., Salt Lake City and Ogden, U. T.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Perseverance in Mining.

The St. Lawrence mine, El Dorado county, has made its first clean-up under the new management. The total amount was 1,370 ounces, worth about \$17.50 per ounce. This would give for the run of twenty-five days the sum of \$24,275, and give as an average for the ore from the recently opened pay shute a yield of over \$92 per ton.

This is, of course, exceptionally rich ore anywhere; but in this instance the good clean-up for the first run under the new management will teach a lesson to miners who have no faith unless they see the contents of the ore in solid coin before them. The story is not very consoling to the members of the English company who deserted the mine, allowed it to fill up with water and pass into the hands of the present owners for a mere bagatelle. The *Mountain Democrat*, published in El Dorado Co., says: "Not an ounce, not a dime's worth of the \$24,275 of this clean-up was so much as 50 feet from the point where the English company suspended operations on the 800-foot level. Much of it was extracted from ore taken out within six feet of where they quit. Their Superintendent, W. H. Rodda, was sanguine that there was good ore near by, and implored them to allow him to cross-cut in search of it. But no, they were unwilling to expend any more money on the mine. And this shute, which at the 800-foot level was only 20 feet wide, has at the further depth of 42 feet widened to 44 feet, with every indication of proportionate increase at greater depths. Patience and perseverance are essential to success in mining."

THE Murchie mine, Nevada county, has been sold. The property consists of seven ledges. The principal ones are the Independence, Wide West and Big Blue, on the lower part of the ground, and the Alice Bell and Lone Star on the upper part. The other two ledges have, the *Transcript* says, only been prospected a little. The hoisting works on the Independence were burned two years ago, and on account of peculiar embarrassments, the original owners have suspended work on all of them since. Work was commenced to erect new hoisting works on the Independence on Wednesday last, and will be pushed ahead as fast as possible until completed. More stamps will be put up at the mill, and the Lone Star and the Alice Bell will be thoroughly opened by tunnels, which have already been commenced. The Murchie property is well known by miners here to be one of the most valuable in the district.

PISCICULTURE.—The Fish Commissioners, at their hatchery near the State University at Berkeley, have recently produced 100,000 mountain trout, which will be distributed throughout the State wherever suitable streams are found. A carload of young shad is shortly expected from the East, when the experiment of propagating this delicious fish in the waters of California will be tried. The Sacramento river will be the first tried, and another effort will be made to introduce lobsters to our waters.

THE losses of American ships has been so great this winter, that the ship-yards of New England are looking forward to a busy year, especially those which build wooden vessels of the best class.

INFORMATION has been received at Winnipeg of the arrival of Sitting Bull at Wood Mountain, British possessions. He has 1,000 captured horses and mules.

"TESTING ORES."—A. B. Roberts, of Boise City, says: I am very much pleased with Chas. H. Aaron's work on "Testing and Working of Silver Ores." It will be the cause of new life and great advancement in silver ore prospecting if miners and prospectors would procure a copy and put in their pockets when they start for the mountains.

And in accordance with law and an order of the Board of Directors, made on the second day of January, 1877, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, Room No. 6, No. 420 California street, San Francisco, California, on Monday, the nineteenth day of March, A. D. 1877, at the hour of two o'clock, P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JAMES M. HAVEN, Secretary.
Office, Room No. 6, No. 420 California street, San Francisco, California.

Dolores Consolidated Mining Company

Location of principal place of business, San Francisco, Cal. Location of works, Dolores Mining District, Esmeralda County, Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 17th day of February, A. D. 1877, an assessment, No. 1, of 10 cents per share, was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 418 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 26th day of March, A. D. 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 16th day of April, A. D. 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Secretary.
Office, Room No. 2, 418 California street, San Francisco, California.

Excelsior Silver Mining Company, Nye

County, Nevada. A meeting of the stockholders of the above company will be held on the 28th day of March, 1877, at the office of the company, 308 Post street, San Francisco, California, to elect Trustees.

W. A. KOLLMYER, Secretary.

SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt
Metal Castings, Brass Ship Work of all kinds, Spikes,
Sheathing Nails, Rudder Braces, Hinges, Ship and Steam-
boat Belts and Gongs of superior tone. All kinds of Cocks
and Valves, Hydraulic Pipes and Nozzles, and Hose Coup-
plings and Connections of all sizes and patterns, furnished
with dispatch. PRICES MODERATE.
J. H. WEED. V. KINGWELL.

Miners' Foundry and Machine Works,
CO-OPERATIVE,
First Street, bet. Howard and Folsom, San Francisco

Machinery and Castings of all kinds.

PICKERING ENGINE GOVERNOR.

Messrs. NEYLAN & YOUNG, San Francisco,

Agents for "PICKERING GOVERNORS."

Gents:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this
year for my patent Straw Burning Threshing Engines give splendid satisfaction. They
far surpass for regularity of speed any Governor that I have ever seen, and I have
seen all the best kinds; I have seen the main belt fly off the pulley several times this season
while threshing, and the engineer did not discover it, so perfectly was the speed main-
tained, until he was told of it; this I consider something wonderful; I consider the Gov-
ernor absolutely perfect, so far as speed is concerned. I bought and put on to one of
my engines a Shive Governor, to see which was the best, and after one season's trial I
have no hesitation in saying they are far superior to any other Governor that I have seen or
used. I wish you would send me the lowest price that you can furnish 25 Governors for
next season's engines. Yours respectfully,
J. L. HEALD.

The only Governor that has received awards at each of the International Exhibitions.
American Institute Fair, New York, 1865, Two Medals; Mechanics' Institute Fair, Bal-
timore, 1865, Silver Medal; American Institute Fair, New York, 1869, Two Medals;
International Exposition, Paris, 1867, One Bronze and Two Special Medals; In-
ternational Exposition, Vienna, 1873, Medal of Progress and Decoration;
International Exhibition, Philadelphia, 1876, Medal and Diploma.

\$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

REFERENCES.

A letter received from the Julian Mill, Newcastle, says of the Carrier Feeder: "It is the most perfect Feeder we have ever seen; don't see how any mill can do without them." A letter from Mr. C. C. Belding, of Amador County, speaks in the highest terms of them. Two of the machines were shipped to the Bunker Hill Mill, also Gover Mill, Amador County. Mr. Stevenson, of Boston Mill, Gold Hill, Nevada, says they are the best Feeder he has ever seen. Soulsby Mill, Tuolumne County. California Company, Nevada City. Omaha Gold Mining Company, Grass Valley. St. Patrick Mill, Placer County.

\$1,000 CHALLENGE.

Backward in Coming Forward.

C. P. Stanford Falls to Come to Time on the Challenge of \$1,000 to Test the Merits of His Ore Feeder as Against Mine. The Challenge is Still Open to Him or any one else. GENTLEMEN, Put up or Shut up.

A letter has been received from the Crescent mine, Plumas County, in which it states that the Tulloch is a failure as against the \$1,000 Challenge Feeder of Hendy's.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

THE ASBESTOS PATENT FIBER COMPANY,

TWO MEDALS OF HONOR.

TWO CERTIFICATES OF THE HIGHEST MERIT.

Of Philadelphia, offer for sale through their agent in San Francisco,

Asbestos Steam Packing, Asbestos Boards and Asbestos Steam Joints,

All manufactured from the pure utilized Asbestos Patent Fiber, and under patents granted to J. S. Rosenthal. The packing is in all sizes from one-quarter to three inches in diameter, round, and free from all grit or mineral matter. The non-utilized or crude Asbestos, manufactured by some parties into packing, is impure and gritty, liable to injure the piston rod and should not be used. The packing made under the Rosenthal patents is of pure utilized Asbestos fiber, and a very superior article and entirely different from the so-called Asbestos packing heretofore offered for sale. It is compact in form, will not fuzz or disintegrate, and will wear much longer than any other kind of packing. The indestructible, expanding, contracting and lubricating qualities of Asbestos are now universally recognized, and packing made from it is peculiarly adapted for steam engines and pumps.

ASBESTOS PATENT FIBER BOARD.

This is the champion non-conductor, to prevent radiation of heat and condensation of steam, as covering for marine, stationary, or locomotive boilers and pipes, and for lining wood-work, where exposed to great heat. It is light, flexible, is not disturbed by vibration, and will not char or crumble. The sheets are 30 by 44 inches, of any desired thickness, and are easily applied.

ASBESTOS PATENT FIBER STEAM JOINTS.

Indestructible by fire or water, expands and contracts in a desirable manner, adjusts itself to any rough point, is cheaper than rubber, and in all respects a superior article. PURE ASBESTOS FIBER for packing steam governors and other purposes. All these goods are extensively used in the Atlantic States and give general satisfaction.

PHILIP HINKLE,

224 SANSOME STREET, SAN FRANCISCO.

Scientific and Practical Books
on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY &
CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the
Extraction of their respective Metals without quick-
silver. 1870.

This rare book on the treatment of gold and silver ores
without quicksilver, is liberally illustrated and crammed
full of facts. It gives short and concise descriptions of var-
ious processes and apparatus employed in this country
and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of fur-
naces, implements and working apparatus.
It is a work of great merit, by an author whose reputa-
tion is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including
the Chlorination Process for Gold-bearing Sulphurets,
Arsenurets, and Gold and Silver Ores generally, with
120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embrac-
ing the subjects treated. Its authority is highly esteemed
and regarded by its readers; containing, as it does, much
essential information to the Miner, Millman, Metallurgist,
and other professional workers in ores and minerals, which
cannot be found elsewhere in print. It also abounds
throughout with facts and instructions rendered valuable
by being clearly rendered together and in simple or-
der. It contains 120 diagrams, illustrating machinery,
etc., which alone are of the greatest value. PRICE, \$7.50

VOLUME XXXIV.
Number 12.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

BIRD CAGE AWNING.—Susannah P. Burton, S. F. This patent covers certain improvements in awnings or shelters such as are used to protect birds in cages from the wind, rain and particularly the sun. As usually made they have a hole made to fit closely over the knob at the top of the cage, and the awning thus fits closely down over the cage, so that when a hot sun beats upon it the air is confined and the heat of the interior of the cage becomes unendurable and is sometimes fatal to the birds. This invention consists in constructing an awning-frame with standards, which elevate the awning some distance above the cage, thus providing a free circulation of air, and not only sheltering the bird from the direct action of the sun's rays but protecting it from the fatal results of over-heating and sunstroke.

EXPLOSIVE COMPOUND.—Julius Goetz, S. F. This is a novel method of forming explosive compounds and rendering them safe from accident or explosion under ordinary circumstances of handling or transportation. It consists in the employment of glucosides, whether in the form of ordinary molasses or the syrup of glucose of commerce, or any solution of uncrystallizable grape sugar, when mixed with compounds of gas-producing or explosive substances. These syrupy solutions when mixed in suitable proportions with chlorate of potash and other combustible and explosive substances will form a permanently plastic mass, the elasticity of which prevents explosion under ordinary circumstances and requires strong concussion under suitable confinement to explode it. The proportion of the ingredients may vary and the ingredients themselves may be replaced by others which are well known as equivalents, but the essential feature of all the compounds covered by the patent is the employment of the uncrystallizable solution of sugar.

SKIMMING MILK.—Hiram Clifford, S. F. When cream is removed from the surface of milk by the usual method of skimming, either much of the cream is stirred into the milk again or a quantity of milk is taken up with the cream; and besides this, much time and labor is required to collect the cream where the milk from a large number of cows has to be skimmed daily. This invention contemplates the separation of the cream from the milk by drawing the milk off underneath the cream, so as to leave the cream in the vessel from which the milk was withdrawn.

MATCH SAFE.—(Design). Percy L. Davis, S. F. This is a design for a combined match holder and a friction mat. It consists of a flat diamond-shaped block of wood. To the front side of the block is secured a star-shaped glass mat, the outside face of which is roughened to form a friction surface to scratch matches upon. On each side of the star, near the acute angles of the diamond-shaped block, is secured a semi-circular box for the reception of matches. This design is very pretty and ornamental.

TOBACCO PRESS.—Bong Moon, S. F. The patent covers an improvement in a machine for compressing leaf tobacco into plugs or cakes, so that it can be readily cut into what is known as long-cut tobacco, for smoking purposes. The device is quite simple and takes up but very little room; it can also be cheaply constructed. The device not only presses the plugs flat but also presses the edges smooth.

BUTTON FASTENER.—James C. Teters, S. F. This invention relates to that class of devices for attaching buttons to clothing and other articles of wear, in which the eye of the button, after being passed through a hole in the material, is secured by a tongue which is formed on or attached to a metal plate.

UNLOADING AND STACKING HAY.—Geo. F. Kelly, Susanville, Lassen county. This invention relates to a novel mechanism which is designed to expedite the unloading and stacking of hay, grain, straw, etc., so that as the teams come from the fields they are relieved of their load at once and can return; and those in charge of the stacking apparatus can transfer the load to its proper place in time for the next team. It consists of a platform mounted upon wheels and having a proper mechanism so that it may be inclined to either side to dump its load when it has arrived at the proper point. The wagons are provided with a netting into which the load is placed and when the wagon arrives at the platform the load is rolled out of the wagon upon the platform. This latter is then hauled up an inclined tramway and when it reaches the top the load is dumped and a stack is thus formed in better shape than can be made by ordinary pitching, and much more expeditiously. The details of construction would be difficult to describe without the aid of engravings.

SAWING MACHINE.—F. W. Krogh, Tulare City, Tulare county. This invention relates to a novel portable device for sawing logs and heavy timber, working upon uneven ground and in places which are difficult of access. A trian-

Diamond Stone Saw.

We give herewith an illustration of the Diamond stone saw which was in operation daily at Centennial. This wonderful machine is made by the Emerson Stone Saw Company, of Pittsburgh, Pa. Doing regular work this machine cuts, in ordinary sandstone, at the rate of 250 surface square feet per hour (counting both sides of the cut). Other stone is cut in proportion, according to the relative density or hardness, leaving the stone perfectly true and in line, beautifully finished and free from "stuns" and "spalls." In fact, when the stone comes from the machine it is ready to be placed in buildings, the work being accomplished in a superior manner, to that done by hand or ordinary machines. This is more than can be accomplished by 100 men in the same space of time and at an expense not exceeding the cost of sharpening and wear of tools necessary to do the same amount of work.

This machine is a triumph of human skill as far as the work it accomplishes is concerned, as in construction it is quite simple. The engraving will show the principle of the device. In the teeth of the circular saw are set diamonds, such as are used in diamond drills. A rapid

EMERSON'S STONE SAWING MACHINE.

gular frame is mounted upon suitable wheels so that it can be easily drawn from place to place. It is made to rest on three wheels in order to accommodate it to uneven surfaces, in such places as are most likely to be occupied by fallen trees. On this frame are all the contrivances necessary to accomplish the objects of the device. The saw and pitman are raised by a rope; the frame is moved forward on its wheels parallel with the tree or log to be cut, and when the proper point is reached the frame is secured by pins. The saw, pitman and guides being next lowered to the log, the guide is secured by driving a pin or spike into the log, as this steadies the log and prevents vibration. By the peculiar construction, the sawing frame can always be supported solidly at any point upon inclined or uneven ground, the motion of the saw itself will be steady, and by a can action, the most favorable movement for sawing will be given it.

SPRING MATTRESS.—A. C. McMains, S. F. This patent covers certain improvements in that class of spring mattresses in which a number of spiral springs, sufficient to form the entire body and surface of the mattress, are simply connected together by a suitably connecting device. The improvements are on a patent previously granted to the same inventor, in the method of joining these springs together, thus greatly improving this class of mattresses.

THE Post-Office Department has made provision for tri-weekly mail communications with the Black hills country, commencing on May 1st.

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective superintendents on file at the offices in this city.

The Calaveras cleaned up \$2,550 last week, the result of 14 days run.

The Lookout winz of the Modoc, now down 80 feet below the Lookout lower tunnel all the way in good ore, shows continued improvement. Both the furnaces at the mine are running.

The Ophir main incline is being sunk rapidly and the Superintendent expects to be opening the 1900-foot level by the 10th of next month.

The Eureka Con. furnace is running on a lower grade of ore than usual, so the bullion will fall off in quantity this month.

The body of water struck in the Barcelona tunnel is steadily increasing.

Operations at the Chollar for the week ending the 17th, were as follows: 680 tons of ore extracted, assaying \$25 per ton; bullion shipped, \$13,757.

The last weekly clean up of the Eureka (G. V.) was 215 ounces of amalgam.

In the Manhattan the 571 crosscut has cut a portion of the ledge; the ledge seems to have been pinched out by the hard rock and contains no ore; the crosscut will be continued a short distance to prove the formation. In 500 west drift the rock has become very hard, the ledge being pinched to a seam, although the ore in the stope above continues good. In Curtis shaft the 560-foot east drift is still in very rich ore with a small ledge.

The Superintendent of the California says in his letter that the bullion shipments will increase from this time, and he fully expects they will exceed those of February before April 1st.

In the Con. Virginia the west drift from the C. & C. shaft on the 1650-foot level is being put in thorough repair and they are breasting out about 50 tons of ore daily, and expect by the first of next month to have the sill in condition to breast out the amount of ore desired for all requirements. The south drift on this level designed to connect with the Con. Virginia deep winze is now advanced 25 feet south of the 1050-foot level west drift and is in very fine ore.

A WARNING.—An accident occurred in Ward district, Nev., the other day, which may serve as a warning to other miners. The *Miner* says that an employee in the Defiance, named Halver Olsen, placed a can of water upon the forge of the blacksmith shop at the Defiance mine for the purpose of thawing out some giant powder caps. The water in the can had previously been used for the purpose of thawing out cartridges, and the nitro-glycerine in the powder, in the process of thawing, had mixed with the water. Olsen began blowing the fire to warm the water, when suddenly an explosion took place, shattering the can to fragments. Mr. Olsen received the full charge in his body, from his head to his hips. His face and chin are frightfully cut, and his hand and arm blown to pieces. Portions of the can entered near the seventh rib, one in the groin and a piece, two inches long, below the umbilicus. He carried a heavy silver watch in his pocket, which perhaps was the means of saving his life, as a piece struck the watch, taking a piece out as large as an acorn. Several pieces from an inch to an inch and a half in length were taken from his body. It is supposed that pieces are still in the man's legs, stomach and lungs. The end of the shop was blown out, also the forge. Mr. Olsen had five cartridges in his pocket, which fortunately did not explode.

LECTURE BY DR. LEWIS.—Dr. Dio Lewis will give us his famous lecture on "Our Girls," at the First Congregational church in Oakland, on Friday evening, March 30th, for the benefit of the free reading-room in Oakland. It will be worth going from San Francisco to hear and doubtless many of our readers in the towns of Alameda county will enjoy the treat. Music, both vocal and instrumental, suitable to the occasion, may be expected.

motion is imparted to the saw, which forthwith cuts its way through the hardest rock in an amazingly short space of time. This stone saw was one of the principal features of Machinery hall of the late International exhibition.

CHROMIUM.—"A reader" asks for information with regard to the value of chromium. He says he has "a prospect" of this metal, but is undecided as to its value. Some say it is worth \$15 per ton, some say \$20 and others \$30. Where there are so many different opinions he is unable to decide what to do. He says he has a large body of the ore and finds float in various places on the surface. In answer to the query, we may state that it is worth from \$15 to \$40 and \$45 per ton, according to the percentage of chromic acid in the ore. This is when there is any sale for the ore. At present the supply greatly exceeds the demand and there is no sale here for it. Our advice is, if our correspondent has a good prospect, to patent the mine to save paying the annual expenditure required by law, and hold on to it until such a time as the ore can be sold. A mine of this substance will be valuable in the future, although it may be of little value now.

ACETIC ACID.—A correspondent in Chicago asks us whether acetic acid (to corrode white lead), is manufactured in this city or State in quantities. This acid used to be made here in large quantities, but none of it has been made for some time, the venture, we believe, not proving profitable.

CORRESPONDENCE.

Tintic Mining District, Utah.

This seat of the principal operations is within 100 miles of Salt Lake City. The mines are reached by the Utah Southern railroad, with the exception at present of a little less than 20 miles of staging.

Matters Geological and Mineralogical

Pertaining to the district are substantially the views of Mr. Camero, an experienced mining engineer, and for some years a resident of Tintic, to whom, in conjunction with Captain Johnson, A. G. Sutherland, District Recorder, and other trustworthy gentlemen, your correspondent is indebted for favors, more particularly in the way of aid to much valuable information.

Tintic, proper, is composed chiefly of a zone of porphyritic and syenitic granite, from four to five miles in width and coursing with the mountain range for distances not yet determined. It is flanked east and west in several instances by beds of limestone, resting upon quartzite, evidently belonging to the silurian series. The porphyries and syenites contain a number of parallel metalliferous dykes, some 500 feet apart, with dip nearly vertical and strike from 10° to 15° east of north, following instead of cutting the general course of the veins. Some of the best ore veins are found in close proximity to these dykes and exist as true fissures, carrying silver ore of the milling class in quartz matrix, containing iron and gold in appreciable quantities. Occasionally the matrix is partially decomposed, with green and blue copper carbonates in some portions of the vein, and here and there bunches of galena and carbonate lead carrying silver and gold in fair values.

Professor J. E. Clayton, reporting on the district, says: "The peculiarity of the Tintic lodes consists in the fact that their contents belong to two geological ages; the oldest vein formation being a true quartz vein, carrying free gold and antimonial silver, with traces of copper only. Subsequent disturbances reopened the fissure and brecciated the old quartz vein and formed a new deposit of copper in the broken spaces and enlargements of the fissure. Portions of the old quartz lode remain in place, carrying gold and silver in high values."

Iron Ore

Is represented to be found of good grade and in quantities apparently inexhaustible in the north-eastern part of the district. It runs from 40% to 60%, besides carrying a small percentage in silver, making it much sought for by the smelters. From five to six claims are steadily at work, and making daily shipments of five or more carloads of 10 tons each, furnishing in itself a strong argument for the extension of the railroad in this direction.

The remaining portion of the field of active mining operations is confined chiefly to the production of the precious metals, and might be well represented as oval in form, with the mines of

Eureka Hill,

In the apex at the northern end. The lodes here appear as parallel veins between the strata of limestone, and are often irregular, not unfrequently breaking from one stratum to another, to again resume their usual course. The hill is not only remarkable for the form of its veins, but also for its quantities of rich ores, in combination with arsenic, antimony, copper and lead.

South of Eureka hill, and on the westerly slope of the mountains at no great distance from the quartzite on one hand, and not far from the junction of the limestone and granite on the other, may be found one of

The Most Remarkable Veins

Of the district and territory for the quantity, variety and richness of its ores. The full width of the vein, or rather ore deposit, has not been definitely ascertained. It is found in the limestone and courses nearly north and south, with the strata. Several locations have been made, among them

The Mammoth Copperopolis,

Located as early as 1871. From the surface to the depth of 100 feet, it was a copper producing mine, having yielded the first two years (when it was closed down,) about 8,000 tons of first-class copper ore, at that time worth \$80 per ton. Yielding in the aggregate, in the neighborhood of \$640,000. It is at present worked by Mr. T. E. Clohecy, of Salt Lake, under lease. A promising silver-bearing vein was discovered in the mine by the lessee in 1875, which has been prospected to the depth of 183 feet by shaft, and incline and level run at the greatest depth. The average width of ore is now 20 feet, all of which is extracted and worked. It samples \$30 in silver, to say nothing of some very rich streaks of chloride silver ore, giving promise of leading to larger deposits.

The greatest attraction in Tintic and one of the most valuable properties in the Territory

is the north extension on this great vein, better known as

The Crismon Mammoth,

The property of Samuel McIntyre & Co. The greatest depth by shafts, 500 feet, two main working tunnels, with other levels and drifts, making a total of 1,250 linear feet. Ore has been traced on the course of the vein in the different levels from 100 to 400 feet, and found in chambers from 6 to 30 feet in width. Fifty feet below the level of the lower tunnel and upward of 300 feet from the surface, a cross-cut was made all through quartz, striking the wall at the distance of 61 feet from the shaft. Thirty-five feet lower, another cross-cut has been extended through ore 51 feet to the west, without reaching the wall. In addition to large reserves of 26% copper ore, there are immense bodies of auriferous and argentiferous ores, some of which is of exceedingly high grade. The great mass of the silver ore works from \$40 to \$100, and a considerable amount of first-class, selected, runs from \$1,000 to \$1,500. A very rich vein of gold quartz was not long since struck and cut on the different levels, from 10 to 14 feet in width. The ore has an average working value of \$250 per ton; selected lots have sampled from \$25,000 to \$100,000, single assays reaching \$400,000. The yield last year was 2,500 tons, with gross value of \$125,000.

It is to be regretted that no calculation was made on the ground of the number of tons of ore in sight. When properly opened the mine will give employment to hundreds of men, where now only a score is employed. The facts need no comment, they speak for themselves. Two good locations have been made, one adjoining on the north, and another on the south, from which much is expected, from their position as well as from present indications.

Moore & Co. have also located 1,500 feet on the ridge immediately above the Mammoth and adjoining on the east. A 20-foot shaft discloses a four and a half foot vein of iron ore, carrying copper, that is said to look exceedingly promising.

The La Fayette M. Co.,

Of Salt Lake City, have sunk a shaft 135 feet on the Red Wolf, south of the great bonanza—Jode, four feet from wall to wall. A small vein of argentiferous galena, worth 30 ounces silver and running 30% in lead. The Swansea and the Lucky Boy, not far from Silver City, have both yielded large amounts of ore and paid well, the former having shipped about \$40,000.

The Porphyritic and Syenitic Belt

Constitutes the largest area of the mineralized portion of the district, the principal mines now worked being found in close proximity to five metalliferous dykes, which have been designated as the Sunbeam, Undine, Victor, Joe Bowers and Rising Sun.

The Sunbeam,

Lying on the west side of the belt, was located in 1869 and the first mineral bearing lode discovered in the district. It has been worked continuously and profitably, the ores usually exceeding \$100 in silver and shipped in very considerable quantity—the Moore claim alone having yielded about \$100,000.

The claims known as the O. K., Whitney, Moore and Huntington have been consolidated and are now owned by Col. J. H. Locke, who is making preparations to open up in good style.

The Peck claim, next north, belonging to Mrs. Kinsey, of Salt Lake City, has a shaft 330 feet following the ore vein, which is somewhat narrow but containing ore that runs from 40 to 160 ounces in silver. The south extension of 1,500 feet, adjoining the property of Col. Locke, is owned by Messrs. Lewis & Moore. Working shaft 150 feet. A 20-foot quartz vein. Ore, free milling and works from \$15 to \$45 per ton.

The Undine,

Situated east of the Sunbeam, was located by Mr. A. B. Jackman and others in 1871, since which a great deal of high grade free milling ore has been taken out near the surface. Vein from two to 18 inches and ore worth from \$75 to \$500 per ton in silver. The last two shipments by Mr. R. S. Hines averaged, on dump, for 1st class, \$168, and for 2d class, \$56.50. It is understood to have paid from the outset.

The Western Union,

(A. Ethier), near the center of the district. Two shafts 41 feet and 65 feet respectively. Ore, high grade carbonates, running 150 oz. of silver and 40% of lead. Width of vein matter, three feet.

The Hidden Treasure,

(N. Groesbeck), has two veins—the smallest from one to 10 inches, containing very high grade ore containing from \$200 to \$1,000 in silver. The larger has two feet of solid ore, in character somewhat refractory and worth from \$20 to \$50. It has yielded ore to the amount of \$13,000.

The Black Dragon,

The property of the Shoebridge S. M. company, on the same range further north, is a large lode from six to 20 feet wide in the limestone, and is said to have been pronounced by Prof. Clayton a true fissure vein. The ores are rather loose, carrying copper and antimony with some arsenic. Some small lots, worked as a test, showed a value in silver of from \$25 to \$60 per ton.

The Sydney,

A little south on the same lode, belonging to Mr. W. Huntington, has yielded, to date, some \$20,000. It is rich in chloride and horn sil-

ver, the ore being found chiefly in pockets and running from \$90 to \$700. A tunnel will soon tap the vein at 250 feet from the surface. The Great Eastern and the Great Western, both owned by Wm. Jones, one mile east of Silver City, are promising—the latter has two feet of \$80 silver-lead ore.

About half a mile east of the Undine is

The Victor Dyke,

Containing a number of very valuable mines. The assay value of the ores sold ranges from \$50 to \$250 silver and from \$10 to \$100 gold per ton. Fifteen mining claims have been located successively on its ore veins to the extent of nearly three miles, the great majority only partially developed. This metalliferous dyke is perhaps the most distinctly marked of any in the district. Beginning with

The Golden Treasure Mine,

On Chloride hill, one of the largest and best developed, a few details will be presented from which an idea can be formed as to the general character and prospective value of the others.

Messrs. Hathaway & Souci, two of the co-partners, are at present extracting and shipping ore, valued at \$80 per ton, silver. The mine is opened to the depth of 400 feet on the vein and embraces over 3,000 linear feet of workings. A cross-cut at one point, 70 feet through vein matter, had not reached the foot-wall, so that its full width is not yet ascertained. The ore veins are from six inches to as many feet, with deposits of ore 30 feet in width, a single chamber having produced 20,000 tons, estimated to average \$100 per ton.

The Julian Lane,

Adjoining the Golden Treasure on the south, has been continuously worked from its discovery. Its owners, while laboring under many disadvantages from lack of capital, have made it pay a considerable amount over the expenses of sinking a 350-foot shaft and running levels, drifts and winzes to the extent of over 2,000 linear feet. Its full width from wall to wall is not fully known. The workings show that it cannot be less than 40 feet, probably very much wider. The ore vein is in many places from six to ten feet. The ore is usually found in chimneys, first-class milling from \$100 to \$250 in silver. It is owned by Mr. M. H. Schock and others, of Diamond City, and like its neighbor, the Golden Treasure, may be booked as a property well worth the possessing in any country.

The Cherokee and Vesuvius mines, one-half mile north, belonging to Dr. Pickman and others, show free milling ore that averages 40 ounces silver.

Lying south of the Julian Lane are the Victor, Norwegian, Lily of the West, Ohno, California, Lily Greenough, Charter, Georgia, Allie Townsend and Hammarskold on the same vein and presenting substantially the same characteristics. The Victor has been opened by a tunnel over 200 feet in length, from which small quantities of ore have been shipped from time to time, and sold to the mills in the vicinity, averaging, in lots of five to ten tons, for first class, \$150; second, \$75; besides a third, and at present an unsaleable class, worth from \$25 to \$30. All these claims carry small values in gold, for which nothing is allowed under \$15 per ton. In this connection may be mentioned the Pismuth Chief, 200 feet west of the Julian Lane, on a parallel lode, that promises to be a paying mine, the property of Dr. Pickman, Sutherland and others.

A mile east of the Victor is

The Joe Bowers Dyke.

The most prominent of the claims are the Joe Bowers, North and South extensions, the North Star and Charter—all evidently located on one continuous vein. The ore is free milling, assaying \$100 and upwards in silver and \$30 in gold. On the east and west of the dyke are found veins of smelting ore, assaying from \$40 to \$50 in silver, and 30% lead in the average, the most prominent of the group being the Showers, the North Bowers and the Estella.

The Showers

(Walker Bros.), leased and worked by A. W. McIntosh, is paying well; shaft in 150 feet, lode, 5 feet; ore vein from four inches to two feet, yielding silver ore from 45 oz. to 60 oz., gold, \$2 to \$9 per ton, lead, 32% to 48%, and iron 5% to 35%, and in demand at the smelters. The Spar, running parallel, and owned by the same, is narrower but much richer.

The North Bowers

(Mathews, Bernham & Sons), shaft 186 feet. The richest streak, from eight to twelve inches, ore averaging \$115 silver and \$12 in gold. The vein at foot of shaft is 18 inches—the ore running from 8% to 13% copper, from \$10 to \$15 gold, and \$100 in silver. Some ore on dump will sample 13% copper, and \$230 silver. It is thought that 30 tons can be extracted per month which will pay a fine profit.

Returning to the main dyke is

The Joe Bowers Proper,

Remarkable for its large outcrop, and the most prominent and promising on the lode. In the spring of 1872 the Wendigo company, of Michigan, purchased 1,300 feet of the claim. Considerable prospecting was done without finding the vein, and finally work was suspended, to be resumed last year with better success, under the superintendence of Captain G. D. Johnson, a member of the company. The shaft has been sunk 300 feet on a spur near its junction with the main lode and proves the position to be well taken. It is carried down through a vein five feet in width containing a clay matrix carrying

minerals the entire depth, consisting of galena, carbonate lead, green copper carbonates, silver and gold. The ores are found in deposits intimately mixed with the matrix in a finely particled condition, requiring dressing before reduction. Experiments have been made in separating the ores from the gangue by water with very satisfactory results. The ore residue assays from \$60 to \$200 silver, and 30% lead, and occasionally a small percentage of copper carrying gold.

At the 300-foot level, the shaft has evidently made connection with the Bowers dyke, and the water has increased beyond the present means of discharge. Of 358 assays made by Mr. J. M. Wayne, assayer of the company, from ores taken from surface downwards, the average was \$122.13 in silver. The outcrop for the width of 20 feet and upwards giving an average value of \$15 silver and \$16 in gold. In view of the immense body of ore, the facility of handling, and the satisfactory results from assays, the Captain was about making a working test of from 25 to 50 tons, with the view of erecting a mill if justified by the returns.

East of the Joe Bowers one-third of a mile is situated

The Rising Sun Dyke,

Cutting a mountain of the same name, rising some 1,500 feet above the general plane of the district, with mines of more or less promise, but not generally much developed. The Rising Sun, owned by Mr. H. C. Wilkin and others, has a vertical shaft 200 feet and has also been cross-cut by a tunnel at a depth from surface of 300 feet. Vein from two to seven feet, ore both milling and smelting, in a quartz matrix, yielding 30% of black oxide of manganese, 30% lead and \$60 per ton silver.

The Jefferson, the General Meade, are located on the same lode, and probably the Southern Belle, Rio del Norte, Alice, Michigan and others, which are said to average well in silver and lead. The Calumet, belonging to Mr. Sutherland and others, and Pewabic, Dr. Pickman and others, at the head of Diamond Hollow, southeast of the Crismon, and believed to be on the same lode, but forgotten to be mentioned in proper order, are said to contain gray sulphurets of copper, averaging 42% copper and 100 ounces silver. The Morning Glory, belonging to Messrs. Brooks, Bee, Lawrence and others, was also overlooked. It is situated not far from Diamond City, is one of the oldest locations, has produced \$25,000 in the gross, shaft 200 feet in depth, lode five feet at foot of shaft, carrying ore, principally silver, with an average working value for unassorted of \$23 per ton, first class being worth about \$90.

The Shoebridge S. M. Co.,

Have opened a mine one-half mile north of Diamond by shaft 350 feet and cross-cut to vein, which shows a width from wall to wall of 20 feet, the ore rather base in character and intermixed with porphyritic granite. Some of it is of high grade, although giving a general average of only about \$50 per ton. A lot shipped some time since to Colorado and worked by the Hunt & Douglas process yielded \$56 per ton, the basest ore having been selected for the purpose of a test. This fact, probably, suggested to Captain Lusk, Superintendent of the mine and of the mill, the idea of introducing this comparatively new process, as an auxiliary to the reduction of the ores in the district.

The company's mill consists of 15 stamps (dry crushing), one Stewart (five hearth) roasting furnace, one Akin roasting furnace, and the usual appliances of all well appointed mills. The mode of working is similar to like mills where roasting is resorted to, with one noticeable exception. The ore, before it is amalgamated, is treated in separate sets of pans, lined with wrought iron, where the chlorides are decomposed, thereby causing (it is claimed) a great saving of quicksilver.

A brief description of

The Hunt & Douglas Process

For the working of ores containing copper and the baser metals, in successful operation here, may not be uninteresting to some of your readers. After the ore is crushed and roasted, it is introduced into large tubs furnished with agitators with revolving arms. They have a capacity for a charge of two tons of ore, and five tons of a saturated solution of salt and chloride of iron, the same being contained in tanks placed immediately over the agitators. The temperature of the contents of the tubs is raised by steam to 130° Fah., and kept in constant agitation for six hours, when it is allowed to settle. On becoming clear the solution is drawn off into a series of smaller tubs charged with metallic copper, which precipitates the silver dissolved by the solution. It then flows through another set of tubs, charged with scrap iron, which in turn precipitates the copper dissolved by the original solution together with that dissolved with the precipitation of the silver, at the same time forming chloride of iron, which regenerates or brings back the solution to its normal state, to be used over and over again. There is still another series of tanks into which the pulp is drawn for the purpose of draining, by means of powerful pumps, the remaining portions of the solution, after which the tailings are removed.

An improvement in conveyors was seen here, the invention of Mr. G. S. Neu, in charge of the works. The principle of its operation and construction is withheld from the public until right is secured, but the whole conveyor, united in sections and 96 feet in length, is driven by a

MECHANICAL PROGRESS.

Hydraulic Welding.

English mechanics are pushing the improvement of hydraulic mechanism for the shaping, welding and upsetting metal. We read of a contrivance by Mr. J. H. Johnson to be employed for actuating the shaping and welding die and the upsetting ram, and it consists, (1.) Of means for operating the same in such a manner as to avoid the frictional resistance incident to the opening of the die when closed by mechanical power; and also of a means for locking the die when closed; so that a pressure within greater than that required to close it will not open it, and for unlocking it with such increased pressure within the die without exerting any appreciably increased power over that required to lock it. (2.) Constructing hydraulic drawbacks to be employed in combination with the shaping and welding die and the upsetting ram, with two passages or conduits, one of which connects the inner end of the inner cylinder with the back end of the drawback cylinder, whilst the other connects the inner end of the drawback cylinder with the accumulator or with the pumps. (3.) In combining with the shaping and welding die and upsetting ram, an apparatus consisting of a holder and a clamp for holding bars of metal as close as practicable to the die against the pressure required to upset them, such apparatus being operated by hydraulic power, which may be regulated according to the work to be performed. (4.) In constructing and arranging the hydraulic accumulators to be employed in combination with the said machinery or apparatus in such a manner that easy access may be obtained to the whole of the moving parts, and packing and facility afforded for the safe and rapid removal and replacing of the weights. (5.) Of improvements in hydraulic machines, to be employed for the before-mentioned purpose, of that class in which the power is produced by a continuously-operating pump, and applied through other mechanism operating intermittently, the object of this part of the invention being to maintain the pump in continuous operation and ready to meet the demands upon it, and to relieve it at all other times, and while thus relieved to maintain a circulation of water through the pump chamber in combination. (6.) Of improvements in the application and regulation of hydraulic power in that class of hydraulic machine referred to under the fifth head of this invention, such improvements consisting in combining with the valves of the pump a system of levers and weights so arranged and operated that the defined movements of the mechanism determine the direction of the pressure upon the pump, also in interposing between the inlet and outlet valves of the pump, a supplemental valve which, when closed, will be held to its seat by the pressure within the pump chamber, and when open will permit the free escape of the fluid from the pump chamber in such a manner as to prevent any accumulation of air therein, also in the employment of a system of lever and weights for regulating the speed of the pumping engine.

THE PROMETHOR.—Although we take no stock in the many marvelous things which are proposed by over-zealous theorists still we believe in presenting the news about the topics as they occur. We read that Philadelphians are to be given a sight of a new machine, invented by a clergyman in Maryland, which is called the Bradley Promethor, and is described at length by a correspondent. The writer claims that "the motor employed in this invention is a well known agent, and one that is beyond comparison powerful in action and easy of management. Second, that the mode of utilizing it is marvelously simple, original and perfect. Third, that its economy is marked, being as one to five, if not six or eight, in comparison with steam. Fourth, that it is managed so as to be positively non-explosive and without danger at any stage. Fifth, that the machine is suitable for all mechanical purposes; and finally, it is unlike anything else in the world of mechanics and will excite an interest in economics and revolutionize the present mode of propulsion in every department of mechanical motion. The machine and its capacities are not simply a great invention, they are an inspiration, utilizing the forces of nature by the principles of natural laws, and confirming to the conception of man the perfections of the divine intelligence in His works. In a few weeks the people will have an opportunity of seeing in operation in Philadelphia, a promethor of the power of 50 horses, which is now nearly ready for exhibition."

A NEW MODE OF SHIPPING GUNS.—According to a contemporary, a smart firm of American engineers in London, who do not believe in peace, have hit upon a novel mode of sending small cannon to any place where they may be required, and where, perhaps, the powers in command might object to their introduction. The plan in question consists of taking two small guns and placing a round bar of strong wood down the bore of each, so as to hold them together, the muzzle joining. They then bind the whole with straw rope, and cover that with a coat of fire-clay. This forms a perfect core, and round it is cast an iron column, like those used in building purposes. When complete they would not excite the suspicions of the most cautious customs officers,

Gauging Cylindrical Bodies.

Jesse Lord takes ground in the *Polytechnic Review* against the ordinary callipers, the wire gauges and the special gauges used for determining the size, diameter and circumference of cylindrical bodies, as shafting, studs, screw blanks and similar objects. The measurement in each of these cases is determined by the sense of feeling alone; a sense that is more liable to variation in the same individual, even in a normal state of health, than any other, and is rarely the same in different persons. No two individuals, using the same pair of callipers on the same piece in the lathe of the machinist, will feel the same degree of resistance as the jaws pass over the two extremes of the diameter. The two jaws merely touch an almost infinitesimal point on either side of the object to be gauged, and if that object is cylindrical the act requires much caution and considerable experience. The apprentice invariably callipers large and he is irregular in his feeling, gauging hard in one place and light in another.

The whole system of measuring the diameter of cylindrical bodies by a gauge that touches only two sides is wrong. As the diameter is to the circumference as minus one to three, a gauge that measures the circumference rather than the diameter has just so much more chance of approximating the correctness than one that measures only the diameter. For detecting irregularities in cylindrical forms, as a lumpy or oval shaft, the callipers is sufficient; but a simpler tool will more accurately determine the size of one as compared with another. A piece of flattened copper wire makes an excellent gauge for measuring shafting. The wire is passed around the shaft, the ends held in the hands, and the edges of the wire laid side by side. A line drawn across both breadths gives the size which may remain as the gauge until the job is finished. If the shaft is too large the lines will not meet; if two small ones will be drawn past the other. Copper wire is preferable to steel, as yielding readily to the curvature of the shaft. Of course, this gauge should not be used while the shaft to be measured is turning, any more than callipers should, as the wire would become worn and so far inaccurate.

Filing to a Line.

Some of our machinist readers may like to give the apprentice a lesson on filing. This is the way the students in the Boston Institute of Technology are taught to file to a line as described by the *Builder*: A rectangular block of cast iron four inches long, two inches wide and one and a quarter inches thick, comes to the student with its two long, narrow sides planed. Two parallel lines have been drawn by the tool of the planer, one on each side, near the upper edge. The student is first instructed how he should remove the skin of the casting from the upper surface without unnecessary injury to his file. Then he is instructed how to remove all of the metal above the two lines with his coarse file, so that when he has removed the scratches produced by that tool with finer files, and draw-filed the surface, he will have accomplished the desired result. When it is finished he will have produced a plane surface parallel to the two lines, and so near them that the removal of more metal would have removed the lines.

To merely rasp the surface with a file will remove the superfluous metal neither expeditiously nor satisfactorily. The student is instructed to lay all the grooves produced by the file in one direction the first time, in a different direction the second time, and in another direction the third time that he passes over the surface. The result is that he can always judge, by the changing color of the metal, where and how deeply his file has just cut. As he watches the ever-varying effect, with its bright and regular mottle, not unlike Scotch plaid in shape, he experiences the same kind of pleasure as when shading in crayon by cross-hatching, or when tinting in color, and he finds that by producing this regular mottle he also produced an almost perfect plane without referring to his straight edge, and that this is part of the art in filing to line.

MILLIONS IN BUTTONS.—The first manufacturer of buttons in America was one Samuel Williston. While he was dragging along as a country storekeeper—his eyes having failed him while studying for the ministry—his wife thought that she could cover by hand the wooden buttons of the time, and thus earn an honest penny. From this the couple advanced in their ambition, until they had perfected machinery for covering buttons, the first employed for the purpose in America. From this sprang an immense factory, and then others, until Samuel Williston made half of the buttons used in the world. His factories are still running at Easthampton, coining wealth for the proprietors, and known to every dealer in buttons all over the world. Samuel Williston is now between 70 and 80 years of age and is worth from five to six millions of dollars, and has given \$400,000 to Easthampton for a seminary and churches, \$200,000 for the founding of a female seminary and \$200,000 to Amherst College, besides lesser gifts to other kindred institutions.

A USED-UP RAILROAD.—A locomotive engineer, who had just been discharged for some cause, gave vent to his spite in a way eminently characteristic of American humor. He said it was about time he left the company anyhow, for the sake of his life, for "there was nothing left of the track but two streaks of rust and the right of way."

SCIENTIFIC PROGRESS.

"Late Theories on the Earth's State."

EDITORS PRESS:—In your late issue of February 24th I observed an article under the above title by Prof. Roscoe, in which he implies that the explanation of underground heat, ancient upheavals or modern volcanoes, by the supposed existence of a comparatively thin shell resting on an interior liquid mass, must now be given up as untenable; giving as the reason therefor the fact that Mr. Mallet's investigations go to prove that this liquefaction of the rocks which we observed may be produced at no very great depth from the earth's surface by the shifting and rubbing together of the rocks, owing to cracking due to the alteration of the temperature, and believes that the friction produced is a sufficient and satisfactory explanation of the occurrence of volcanic action.

Not being acquainted with Mr. Mallet's investigations I cannot understand what circumstance leads him to infer that the heat produced by the secular cooling and shrinkage of the earth should be sufficient to give rise to the molten masses ejected as lava, nor is it to me apparent how on this supposition volcanic action should almost invariably take place at the same localities. Is there not an improbability on the face of the theory? I should imagine that the rocks having once, by their own friction upon each other, become melted and ejected, they could scarce go through the same process of slipping, melting, and ejection again; accordingly no two eruptions would take place at the same locality, but would take place at various parts of the surface wherever such slipping of the rocks should occur.

If Prof. Roscoe thinks that the heat produced according to the theory he advocates is sufficient to cause the phenomenon of volcanic action, how does he explain the fact that the coal beds found in disturbed regions are not consumed? It is certainly to be inferred that such distortions and faults as are found in the rocks of our Middle States should have in their formation developed sufficient heat to ignite the coal beds, instead of merely driving off the more volatile hydro-carbon compounds. That our anthracite coal is so formed, we are led to infer from the fact that in all undisturbed regions the coal is soft or bituminous.

Some years past a chemical theory of volcanic action was advanced, which endeavored to account for volcanic action upon the hypothesis of a chemical combination of the materials of the inside of the earth with water from the outside, i. e., of the existence of an unoxidized metallic nucleus.

Some appearance of truth was given to this supposition, by the fact that the constitution of the lava was found to be of such a nature as to admit of oxidation by the means supposed. This oxidation was, of course, to supply the necessary heat.

When Professor Bunsen made his celebrated tour to Iceland, he investigated, among other things, the truth of this volcanic theory. True to the supposition, he found hydrogen to be emitted from the volcanic vent, but declared that it could not have been due to the decomposition of infiltrated water, since at the temperature necessary to produce such a decomposition it would be impossible for the carbonic acid generated from the fused rocks by the hydrochloric acid supplied by the salt water, to remain in contact with the hydrogen without being reduced to carbonic oxide, and not a single trace of this gas was ever discovered. This seemed to be universally accepted as a final answer, for now the chemical theory is but rarely advocated.

Perhaps Professor Roscoe will favor us with some of Mr. Mallet's proofs, as well as a further explanation of his quaint theory.

OTTO C. WOLF.

Philadelphia, March 5th, 1877.

ESSAY PRIZES, DANISH ACADEMY OF SCIENCES.

—The Royal Academy of Sciences of Denmark offers a gold medal for researches into the numbers which have served as a basis for astronomical science from the time of Ptolemy to the end of the eighteenth century; another for an investigation of the refraction of light, as dependent on the various conditions of bodies, with the object of elucidating the refractive and dispersive power of certain volatile bodies in the condition of vapor; the Thott prize of £20 for an investigation into the laws which regulate the progress of chemical reaction in chosen cases; the Classen prize of £20 for an investigation of the question, are the salts of soda as necessary for the normal development of plants as the salts of potash, lime, magnesia and iron? A prize of £40 for an investigation into the reason why Danish barley is often unfit for making good malt. The competition is open to all the world, excepting members of the Danish Academy resident in Denmark. Essays may be written in Latin, French, English, German, Danish or Swedish, and must be sent in (except for one or two essays) before the end of October, 1877, to Mr. Japetus Steenstrup, at the University of Copenhagen.

Limestone Formations.

Dr. Carpenter recently delivered a lecture on this subject, in England, in which he said there was more resemblance between a piece of limestone and a piece of chalk than most people would suppose. Persons acquainted with the chemistry of things knew perfectly well that they were the same substances chemically. He explained the various kinds of limestone, particularly mentioning the crystal and the marble formation. But all four—chalk, limestone, marble and the large crystal—were exactly the same chemically, though they differed in form. Geologists had reason to believe that nearly all limestone had been formed in the same manner—from the remains of marine animals. In different parts of the various series there were beds of limestone obviously entirely formed of the remains of animals, and this was particularly noticed in the later beds. He explained at length the formation of the Giant's Causeway, and pointed out more remarkable illustrations of metamorphosis, and upon the evidence thus adduced he came to the conclusion that the great mass of the carboniferous limestone was originally a chalk deposit. He was aware of the doctrine that this carboniferous limestone was all coral, but upon various grounds he disbelieved this theory and adhered to his conclusion that this limestone formation was originally a sort of chalk at the bottom of the sea. He pointed out the marvelous utility of the microscope in determining the nature of limestone, and said that from a little specimen in his possession, which was not larger than a pin's head, he had no doubt that the great mass of the Serpentine series was composed of an organic structure.

THE BRAINS OF CRIMINALS.—Says the *British Medical Journal*: In our last issue we published a very interesting letter from our Vienna correspondent, in which a brief summary was given of Prof. Benedict's researches on the brains and skulls of criminals. The subject is an important one, both from a physiological and a psychological point of view, and it is to be hoped that more extended and more precise inquiry will be made upon it, for the results which Dr. Benedict has obtained, though very important, are not sufficiently numerous to warrant any large induction. Up to the present time Dr. Benedict has examined the brains of 16 criminals, all of which, on comparison with the healthy brain, he finds to be abnormal. Not only has he found that these brains deviate from the normal type, and approach that of lower animals, but he has been able to classify them, and with them the skulls in which they were contained, in three categories: These consist in: First, absence of symmetry between the two halves of the brain; second, an obliquity of the interior part of the brain or skull—in fact, a continuation upward of what we term a sloping forehead; third, a distinct lessening of the posterior cerebral lobes, so that, as in the lower animals, they are not large enough to hide the cerebellum. In all these peculiarities the criminal's brain and skull are distinctly of a lower type than those of normal men, and the interesting question arises, how far are evil effects of the criminal to be attributed to this retrograde development?

A PROBLEM IN OIL GAS.—In an address before the N. E. Gas Engineers' Convention, Mr. Price stated the following concerning the manufacture of gas from oil: Oil gas is much better than either candles or lamps. A very small works for making gas from oil may be constructed for a little money. In such a case I should recommend the use of oil. I have never known a community that was satisfied with oil gas. The inevitable smoke deposits soot upon walls, and ruins frescoes and pictures. If air is used there will be blowing. I visited works at Reading, Penn., last autumn for the purpose of seeing oil gas, which was said to be free from objection. I went with the gentleman who superintended the construction of the works, and who thought them very complete. On leaving the cars we went down to the works and, in passing through the grounds, I saw several lanterns badly smoked. They have tried to overcome the difficulty by using small burners, but the smoke was there, and I am convinced it is a difficulty hard to obviate. The soot produced by oil gas is the meanest soot in the world. It sticks like oil and lampblack; it cannot be removed.

A WONDERFUL SPECIES OF THE COTTON PLANT.—A cable dispatch from London to one of our daily papers says: A remarkable discovery has been made in Egypt by Signor Giacomo Rossi, Austrian Consular Agent at Alexandria. He has found a new cotton plant, which is so wonderfully prolific that it may prove a dangerous enemy, the report says, to the American cotton raising interests. Signor Rossi, in his report of the discovery, says that about two years ago he accidentally came across the new plant on the property of a captain in the Menulia district, who collected the seed and sold it to his neighbors at twelvelfold the price obtained for the ordinary kind. The plant has a long stem, and being without branches much space is saved. It bears on an average 50 pods on each bush, while the usual yield of the plant is about 30. A smaller quantity of seed is needed, but the great drawback in Egypt is that it requires much more water, which necessitates the alternating of the crops with grain and vegetables. In the sea islands of the Atlantic coast or along the lower Mississippi it would prove wonderfully prolific.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

MOUNTAIN CLAIM.—Alpine Chronicle, March 17: The Mountain No. 1 company having let a contract to run their tunnel 200 feet, Monday's staff brought in a crew of miners to do the work. They commenced work on the outside on Wednesday and soon had the road to the tunnel laid in good condition. As soon as a new track can be laid, and some new air boxes placed in the tunnel, the contractors will commence driving the tunnel.

SILVER CLOUD.—Miners to start up work on the Silver Cloud claim in the Raymond district, arrived at Markleville a few days since, and we presume they have commenced.

LADY FRANKLIN.—The old tunnel has been cleaned out and now a run of about 20 feet must be made to cut the incline, now 85 feet in depth.

MILL REFINING.—It is pleasing to know that the Exchequer mill is completed and now running, having been started up this morning. The mill has been entirely rebuilt. It has stamps and has in connection with it an O'Hara's Champion furnace, which is capable of working 30 tons of ore per day. This mill has been planned by Manager Chalmers with a view to its doing its work with as little manual labor as possible, and is one of the best appointed mills on the Pacific slope. It has been placed by Mr. Chalmers under the full control of E. B. Smith, of San Francisco. Mr. Smith had charge of the O'Hara's furnace at Nevada, and made the successful run on the Consolidated ore, and we are satisfied that the new mill will be run successfully under his management.

SILVER CREEK.—On Tuesday last this company broke ground for their tunnel, which is to cut the Mountain ledge. This tunnel is about half a mile north of the Mountain tunnel and a little south of opposite Fisk's hotel. This company commences work under favorable circumstances.

AN EVENTFUL WEEK.—The week ending with this day has been an eventful one in the history of Alpine. The week opened with a resumption of work on the Silver Cloud claim in the Raymond district, and then came the starting of the Silver Creek company's tunnel on the Mountain ledge, at Silver Mountain. On Wednesday afternoon work was resumed at the Mountain No. 1 claim, at Silver Mountain, and this morning the Exchequer mill and O'Hara's Champion furnace commenced work on Exchequer ore. The jumping of lots has been inaugurated at Monitor, the people of that town expecting "big things" when the Advance strikes the ledge. The most notable event of the week, however, is the starting up of the O'Hara furnace, the successful working of which cannot be doubted, its success at Peavine proving that such a process for reducing our rebellious ores is all that we require to place Alpine at the head of the mining counties of California.

Too Soon.—The great revival that is now progressing in our county—but more particularly in this (Silver Mountain) district—in mining is attracting attention on the outside, and daily we notice new faces on the street; and now that thousands of miners have been thrown out of employment on the Comstock, it is to be expected that a lot of them are yet struck by this town, with the natural expectation of getting work immediately. We regret to be compelled to warn such to stay away for a time, at least, as we now have too many idle men here—but we will admit that many now here will remain idle, as their habits will prevent their obtaining work in any of our mines, the managers having decided to employ none but sober, steady men. Our companies are preparing to find valuable mining camps, and the managers of these competent miners and mechanics—steady men—will find remunerative employment. So, to those contemplating coming here for work, we say: Stay away a while longer—unless you have money to live on while waiting for work.

AMADOR.

BECK.—Amador Ledger, March 17: Captain Beck reports satisfactory progress on this claim. The drift to determine the width of ore body is in 50 feet, and still no hanging wall appears. Parties who have inspected the mine lately, say it is the biggest mass of quartz they have seen anywhere in California. Throughout this vast vein scarcely a barren streak has been passed. The only spots of low grade ore yet struck in this town, a foot in width, and this is estimated to yield between 84 and 85 per ton. The remainder of the ledge is believed to be good paying rock. Some of it is immensely rich, its value running up into the hundreds of dollars. Captain Beck has negotiated for the Volunteer mill, for the purpose of demonstrating the value of the mine. The hauling of the rock will be commenced forthwith. Should the result approximate to the expectation of the owners, an impetus will be given to mining industry in this vicinity such as we have not witnessed in many years.

VOLCANO TUNNEL.—The great boring undertaking at Volcano makes slow progress. The rock is excessively hard.

TALISMAN.—The new 10-stamp mill of the Talisman mine near Amador City, was started last week, and works beautifully. It is run entirely by water, and is said to be one of the neatest pieces of workmanship in the State.

FIDDLERTOWN MINING.—All the gravel claims around Fiddletown are in full blast, giving the town quite a lively appearance. There are some excellent mines around here, the great drawback being the scarcity of water, the water supply only lasting a few months in the year. The companies that the supply will be exhausted probably in June. The American Flat claim made a clean-up last week from a run of nine days and realized \$1,500, a very gratifying yield.

BETWEEN PLYMOUTH AND AMADOR.—A correspondent writing from Plymouth on the mining prospects of that vicinity, says: This part of the county is passing through one of those periods of transition which occur every five or six years in our country. Parties, not only of prospectors but locators, are daily examining and locating quartz claims on the mining belt from Plymouth to the Cosumnes. The Enterprise mill will soon start up under the superintendency of Mr. Vaughan, and in our opinion in two years, from Dry Creek to the county line north, not less than ten quartz mills will be in successful operation.

OLIVE.—One hundred and thirty-seven tons of rock from this mine have been crushed at the Bonanza mill. The clean-up was made on Thursday. A parallel ledge was recently discovered 30 feet on the hanging wall side of the present vein. It is three feet in thickness, with the surface indications quite as favorable as those which marked the old ledge. The rock averaged \$18 per ton—a splendid showing.

BUTTE.

CAPITAL.—Oroville Mercury, March 16: Since the bonanza stocks of Virginia have played such havoc with the fortunes of men, who have dabbled in them, capitalists have turned their attention to the mining industry as part of the State. Fortunes are not made so quickly as in stock, but they are sure in the end to be made. Some gravel beds have been opened here that are of great value and are paying large profits; others are being developed and give promise of being rich. A few days since a party from San Francisco, consisting of E. Levy, J. M. Keeler and J. H. Ferguson, came up and bought what is known as the old Kent claims, some three miles below town, and are now engaged in building upon it. They will soon put up an engine to pump out the water, and will put a crew of men at work sluicing off the dirt. This is a rich spot of ground, and the only trouble has been to get fall enough to work it.

CALAVERAS.

ANOTHER BONANZA.—Calaveras Chronicle, March 17:

Mr. J. Lefoy, of this place, who has lately been engaged in mining out the old Estrade lot, on East Center street, says he has struck it big. The gravel yields from 25 cents to \$1 to the pan. It is no use of talking, you can find gold anywhere in Mokelumne hill.

RICH GRAVEL.—Peck, Vandel & Co., the young men who have been engaged in mining out the old Wentzel lot, at the junction of Lafayette street and Schoolhouse avenue, have struck a rich deposit of gravel. The boys cleaned up last Monday, realizing quite a large sum.

MINE NEWS.—At the Duryen mine the battery is kept in motion day and night. A large force of hands is constantly employed getting out gravel. The Duryen mine is giving a good account of itself. Brown's new tunnel, in Tunnel Ridge, opposite Duryen's, is fast approaching the channel. Brown is persevering and deserves success. Veith is plying away with renewed energy and is being well rewarded for his labors. Moser's hydraulic, on Tunnel Ridge, is in full blast. His claim runs smoothly in this vicinity. Everything is running smoothly in the Emerson hydraulic in Happy valley. We expect to hear of a large clean-up shortly. Cook's new hydraulic, near the French hospital, is in full blast. The prospects are flattering.

UPPER COUNTRY JOHN.—Champion stopping. Quality of rock improves as developments proceed. Vein, two feet wide, in granite, owned by White & Co., has been found 100 tons on the dump. Rock prospects well. Work on Hall's mill, at Skull Flat, is progressing rapidly. Chapman rock nearly all crushed. Field & Co. have struck rich rock. Peter Grass, near Mosquito, has recently struck a new lead. Rock averages \$45 per ton. Tiger mill, at Rich Gulch Flat, crushing.

EL DORADO.

FLUKE.—El Dorado Republican, March 15: We visited this week the claim of Knox, Evans & Varroza, on the north side of Hangtown hill, consisting of some 15 or 20 acres of gravel. We found them nearly ready to start up in splendid shape. They have in some 400 or 500 feet of substantial flume of a capacity to carry 400 inches of water with debris. They expect to be ready to turn on water next week. It is one of the easiest claims in the county to work as now arranged, and the boys will soon have more money than they will know what to do with.

KERN.

PROSPECTING.—Cor. Courier-Californian, March 10: Prospectors and miners about Kernville, in small parties, are out in all directions making claims and working them on their own account, thus opening up new mines. In dull times or any discipline would teach people not to place themselves in the power of a corporation, the experience could hardly be too dearly paid for. We can get no reliable information in regard to mining prospects. The mining companies choose to keep their business to themselves. They have it in their power to stop the work and have done so; it will stop, doubtless, until their work is completed, whatever that may be. Meantime, the people who are dependent upon work in the mines for a living must move away, do something else or starve.

NEVADA.

NORTH BANNER.—Nevada Transcript, March 15: One of the important mining enterprises which have been started during the past six months in this vicinity, is the opening of the north extension of the Banner mine, situated about three miles from this city. H. P. Conner and others commenced work on it some months since. Hoisting works were commenced and they expect to be ready to turn on water down 186 feet. The ledge at that depth varies from four to eight feet, and the rock looks remarkably well. Assays show that it contains all the way from \$100 to \$150 to the ton. It is the intention of the company to prosecute the work on an extensive scale, and to thoroughly develop the mine. Repeated assays of the rock, from the surface down, show that the shaft is being sunk on a rich shale, and there is not the least doubt that the company will open one of the best mines in the district. The original Banner mine has yielded large amounts of bullion, and is yet regarded by all who worked in it while running as a first-class mine. The indications thus far go to show that the north extension will be still better. The rock is heavily sulphureted from 115 feet below the surface, and the rock from that increases in value, every foot sunk, to the bottom of the shaft; and the size of the deposit is so large that an almost unlimited quantity of rock can be extracted when the levels are well opened.

THE RICH HILL LEDGE. situated on Ophir hill, was sold a few days ago, for \$8,000, to James Champion, of Grass Valley. The former owners were Wm. O'Donnell, Con. Reilly, M. Cloonan, Dennis Meagher, T. Cloonan and Lawrence Fahey.

SOME OF THE BEST ROCK EVER TAKEN OUT OF THE DISTRICT is now being taken out of the Mountaineer ledge, down Deer creek. It is nearly all sulphurets, and the ledge is two feet thick. The rock in the mine pays all the way from \$50 to \$100 to the ton.

INYO.

DEFIANCE.—Coso Mining News, March 17: One of the Defiance furnaces was started up last Wednesday, and is now running in an excellent manner. We visited the furnace last Thursday, and was kindly shown around by Mr. J. S. Gorman, the lessee, and found everything in fine condition for a long and successful run. There are about 600 tons of good ore on the furnace dumps at present, and the mine is now producing daily more than can be reduced with one furnace. In a short time, as soon as coal can be had in larger quantities, the other furnace will be started and both kept going as long as ore can be had. The class of ore now being extracted from the mine, as also that upon the furnace dumps, is superior to that heretofore smelted, and the bullion which is now being produced is greatly in excess in value per ton of that which was shipped on the last run.

OLIVE.—Mr. Water has been here on this week to report upon New Coso, as also the Emigrant company's mines, at Lee district. He returned to San Francisco last Wednesday, and we hope he will report favorably upon what he has seen. To show that it is not any easy matter to guess the true value of ore by a mere examination by the eye, we will incidentally mention that, while at the Lucky Jim mine, he picked up a piece of ore, not large enough to see the progress making. A party standing by said it would go about \$200. Mr. Skidmore wagged that it would not go over \$100. He brought the piece down, assayed it himself, and was surprised to find it go \$220. He thinks we have pretty good galena ore in this country.

MONO.

BODIE DISTRICT.—Cor. Inyo Independent: In the flush days of Aurora, Bodie was favorably known, but as Aurora died out so did Bodie. But a few still stuck to their claims, and at present the prospects are that they will be handsomely rewarded for their pluck and faith. The Syndicate mine in early days had such a good showing. A party standing by said it would go about \$200. Mr. Skidmore wagged that it would not go over \$100. He brought the piece down, assayed it himself, and was surprised to find it go \$220. He thinks we have pretty good galena ore in this country.

lots and watching mining claims that might be jumped has been commenced.

PLACER.

GRAVEL.—Dutch Flat Forum March 15: The Star & Union, Elmore Hill, Summerville, Central, Franklin, Southern Cross and Polar Star claims are washing. The Baker has turned off and is cleaning up a portion of the sluices in the tunnel below. Washing therein will be resumed today. Two powder drifts are being run, which when exploded will open the pit beyond the shaft and into the solid gravel, after which the drifted ground will be passed and good clean-ups may be expected. The Pacific claim cleaned up on Monday and is now re-fitting. At Gold run the Indiana Hill and Hoskin claims continue washing. The Cedar and Gold Run claims have refitted and are on again. The cement mill continues stamping the gold out of the blue gravel and is paying well. Our drifts are still running full.

ALTA MINES. The tunnel in the Shady Glen is extended over 100 feet in gravel. They are now passing over a channel several feet lower than the bottom of the tunnel and the gravel which it contains is found to be of sufficient richness to pay for drifting. The tunnel will be advanced until the rim rock on the opposite side of the channel is reached, drifts will then be opened, the bedrock, when breasting out of the rich gravel will be commenced. The channel will be drained by means of a siphon.

LITTLE YORK.—The Empire and Christmas Hill Co. continue to wash steadily.

GREEN VALLEY.—Work in the Opel claim has undergone a series of drawbacks, caused by the banks caving, plunging the tunnel a great many times. The work is now progressing under more favorable circumstances. The stop raised in the Novey Co. a cement mine was found to be in high rim rock; it was therefore abandoned, and the work of advancing the main tunnel is now progressing, and will be completed in a few days to a point from which it is thought the lowest part of the channel can be worked through.

REMINOTON HILL.—The Rhode Island Co. continue to ground sluice, as there is not sufficient water for hydraulic purposes. The work of advancing both tunnels in the Wide West mine is now progressing.

LOWELL HILL.—The Swamp Angel Co. continue to advance the main tunnel and open up new breasts, the work of excavating the old ones is being accomplished with success. The bedrock tunnel in the Wild Cat mine is advanced 700 feet, they expect to reach gravel soon.

QUARTZ.—Placer Argus, March 17: The St. Patrick cleaned up last Saturday, after a successful run of one month, the amount realized being a little over \$10,000. The mine is looking unusually well now, and everything indicates a dividend at an early day. Sinking the main shaft is progressing steadily, and at the same time ore of splendid quality is coming from the stopes in sufficient quantity to keep the mill running. The Good Friday is turning up pay rock now, and the prospect of the mine is reported excellent. Mr. Sharpleff has struck another pocket in his lead on Duncan hill, where he took out so much gold some months ago. Other ledges in the vicinity are looking well and prospect for a prosperous season in quartz mining never was better.

PLUMAS.

GENESSEE QUARTZ.—Plumas National, March 17: We learn that a company of men have been prospecting during the past winter for a quartz mine, on the opposite side of the creek from the Genessee mine, and a short distance up the canyon. Within the past month a ledge has been developed, the rock in which is of the same character as the Genessee and prospects richly. The owners are positive that they have found the extension of the old mine, and if it is as permanently good as has been the old mine, they are lucky indeed.

"GREAT SENSATION."—Several of our citizens have during the winter been running a prospect tunnel in the ridge north of Thompson's creek, and on Wednesday we paid a visit to the works. The tunnel is over 100 feet long, all the way in a very rich rim rock. The workmen have just cut away from the extension of the old mine, and they will soon have "pay grit." The wash is coarse and mixed with quartz and iron rock. Occasionally a few "colors" are found, but the bedrock being perfectly smooth and decidedly "on the pitch," would of course preclude the possibility of finding much pay until further developments are made. The "Great Sensation" is in a new district hitherto unprospected.

LEWIS.—Benjamin is running a new ditch from Indian creek to his claims near Upper Lone Rock. He has some good prospects. Morton commenced piling in his Light's canyon claims one day this week. O'Toole & Co. are still sinking their incline shaft in the big channel above Elizabethtown. They have found some good gravel which prospects well, and certainly will get good pay when they reach bedrock. Any quantity of prospectors in the Greenville and Wolf Creek section. The Bell company have decided to put up a quartz mill this spring.

SIERRA.

ORO M. Co.—Mountain Messenger, March 17: At a meeting of the Oro mining company, held on Wednesday evening, it was decided to go to the progress making. The mine, it is probable that a 12-stamp mill will be erected, though that has not been definitely decided upon yet. The ledge is known to be large, and to prospect fairly in every part. We do not think there is a doubt about its paying if properly managed.

THE IOWA COMPANY had not struck bedrock at last accounts, but were finding pay in the ground encountered. It is becoming more certain that there is a body of pay gravel there the lower the shaft goes.

THE AMERICAN HILL COMPANY is running full time, or was a few days since, using both monitors. They have already pipped off a large amount of ground.

THE SWALLOW COMPANY, Monte Cristo, declared a dividend of 18 cents to the share for the month of February. The Brush Creek mill will be started in a week or ten days, we are informed. They have some very rich quartz in the dump.

SONOMA.

SANTA ROSA COAL MINES.—Sonoma Democrat, March 17: We visited these promising mines yesterday, and found them not only in the progress of development, but we think a mine will be opened there which will prove of great value. The ledge is well defined between fire clay walls, and has every appearance of a true fissure vein. The coal is of very superior quality. Everything points to the speedy development of a large deposit of coal.

VENTURA.

GOLD.—Ventura Free Press, March 17: Messrs. Reis, Bledsoe and other gentlemen, who have just returned from a visit to the Calomeros district, represent that at a point on San Francisco creek, about nine miles north of Newhall, they found gold all over the hills, as well as in the bed of the stream. The gold some of which we have seen in small scales, and its rough appearance shows that it has originated from a vein somewhere in the immediate vicinity. That vein ought to be readily found. The absence of rain this year will prevent much work being done, though the creek affords a small sluice stream. The channel in places is narrow and easily dammed, so that in ordinary seasons a supply of water can be accumulated. Some parties are now at work by "dry washing" the dirt, using a winnowing machine.

Nevada.

WASHOE DISTRICT.

GOULD & CURRY.—Gold Hill News, March 25: The pump stations, tanks and pump holes are all completed, ready to put in the rods down to the 1500-ft level. The rods will all be in place ready to run by the 1st day of April. When that part of the work is finished everything will be in perfect order for the development of the lower levels. The main south drift will penetrate and prospect a portion of the ledge never yet reached by any of the prospecting drifts, and will open up quite an extent of entirely virgin ground.

BEST & BLECHER.—Three cross-cuts are now being run to the eastward on the 1700-ft level. Cross-cut No. 1, near the south line of the Consolidated Virginia, is in

about 40 feet, and is following the line of the diamond-drill hole recently sent out to the eastward at that point.

JEAN. The quartz and ore in the face of the main south drift on the 1600-ft level is steadily increasing in value as the drift advances to the southward. The same may be said of the ore in the face of the main south drift on the 1800-ft level, the ore in the face of the drift having increased in value until it is now almost of a milling quality. The ledge seems to be steadily widening on that level.

KNUCKENBOCKER.—The water in the shaft is reduced today to about 100 feet below the 1000-ft station. It is being reduced more rapidly at present, owing to decrease of flowage, and the bottom of the shaft, which is 865 feet deep, will be reached next week. Owing to the proper precautions which were made to secure the timbering of the mine before work was discontinued and the water allowed to fill the mine, the stations and drifts at the 400 and 600-ft levels are found to be uninjured.

YELLOW JACKET.—The two east cross-cuts on the 2040-ft level are being pushed vigorously forward, the face of the north drift being in favorable ground. At the new shaft the last five days have been employed in relieving the timbers in the shaft below the 500-ft level. This has been finished and sinking resumed. The shaft is now down 573 feet. The flow of water is not very strong.

MINT.—The dump below the 1400-ft station is finished and closed, boarded to the bottom, so as to keep it in an easy condition for cleaning out or recovering a water tank, should one be lost. A splendid double station has been completed at the 1400-ft level and a drift started to cut the ore vein.

OVERMAN.—Sinking the winze below the 1200-ft level is making the usual fair rate of progress, the bottom still in very favorable vein matter, carrying streaks of good ore. A discharge of water was stuck in the bottom yesterday morning. The stories put in circulation by interested parties to the effect that the ledge has been penetrated by diamond drills on either the 1300 or 1400-ft levels have not a word of truth in them. The only prospecting that has yet been done with the drills ahead of the drifts on either level, was the sending of the drill ahead of the face of the drift on the 1300-ft level to tap the water. There the drill was driven in until it struck and stuck fast in what is supposed to be the west vein. Finding it impossible to drive the drill further at that time, the water was allowed to drain and the drill again inserted, but stuck as badly as ever. The drilling was then abandoned and the drift started forward, but has not yet reached the clay. On the 1400-ft level the water has drained until the strong head recently encountered has weakened sufficiently to admit of again pushing the drift ahead.

CON. VIRGINIA.—Daily yield, 450 tons of ore. This is a decided increase in the quantity of ore produced, and begins to look as if the promised resumption of dividends would not be much longer delayed. The Trench and Bacon mills have been added to the crushing capacity of the mine, and notwithstanding the delay caused by the repairs to the Consolidated mill the first of the month, the bullion yield for the month of March was undoubtedly largely in excess of that of February. The west drift on the 1550-ft level is finished, making the extraction of the ore in the southwest portion of the mine on that level much easier. On the 1650-ft level the sills have been laid and the first sets of timbers put in, preparatory to stopping the ore. While doing this, about 50 tons of rich ore per day have been hoisted through the C. & S. shaft.

THE CON. VIRGINIA.—Owing to a stoppage of the Savage pumps during the first part of the week, the Hale & Norcross pumps have been unable to keep down the flow of water, which rose in the main incline to a short distance below the 1900-ft station. The pumps were, however, kept busily at work, and last evening the water was again drained to a distance of 35 feet below the 1900-ft level. At the rapid rate at which the water is now being reduced, the level of the main incline is being reached in a few days, and repairs again proceeded with. The great heat in the shaft, caused by the high temperature of the water, necessarily makes the prosecution of such work slow.

CALIFORNIA.—Daily yield, 550 tons of ore, keeping the mills running up to their full capacities. The yield of bullion, notwithstanding the delay experienced in its production the first of the month on account of the renovation of the California mill, is about in excess of the yield for the month of February at the same date, making sure the payment of the regular dividend of \$2 per share. The ore stopes in every part of the mine are yielding rich ore, and the future prospects were never as bright as at this time. On the 1650-ft level a double track has been laid in the drift connecting the deep winze with the west drift. This drift is to be extended northward through the ore vein of the California mill, and is to be reached in a few days for the month of February at the same date, making sure the payment of the regular dividend of \$2 per share. The ore stopes in every part of the mine are yielding rich ore, and the future prospects were never as bright as at this time. On the 1650-ft level a double track has been laid in the drift connecting the deep winze with the west drift. This drift is to be extended northward through the ore vein of the California mill, and is to be reached in a few days for the month of February at the same date, making sure the payment of the regular dividend of \$2 per share. The ore stopes in every part of the mine are yielding rich ore, and the future prospects were never as bright as at this time. On the 1650-ft level a double track has been laid in the drift connecting the deep winze with the west drift. This drift is to be extended northward through the ore vein of the California mill, and is to be reached in a few days for the month of February at the same date, making sure the payment of the regular dividend of \$2 per share.

LADY WASHINGTON.—A drift has been run 50 feet west from the 950-ft station at the bottom of the winze below the 850-ft level, almost the entire distance through quartz and low grade ore. The opinion of most of the experts who have heretofore examined the ledge on the 850-ft level, has been to the effect that the larger portion and better portion of the vein was most likely to be developed to the eastward. This quartz body opening out entirely west of the discoveries on the 850-ft level, at a depth of 100 feet or more, seems to rather upset these theories and looks as if the west wall of the ore vein had not yet been reached at all. It also carries the vein back nearer a direct line with the ledge in the Overman, which, on the lowest levels in that mine, has a strong tendency to the south and east or almost directly toward the Lady Washington ground.

BLITCHER.—Daily yield, 90 tons of ore. The ore is being crushed as fast as it is extracted, and is paying a better profit than for some time past. The yield for the month of March will not be far from \$80,000, and the profit on the ore crushed will nearly, if not quite, pay the running expenses of the mine for the month. Sinking the main incline was stopped by a breakage of one of the small pumps on Sunday last. The water rose 124 feet in the shaft before the damage could be repaired. The water was then pumped out and the pump shaft is making the best of progress. The 1800-ft station is in, ready to commence the prospecting of that level whenever the management desires to do it.

SILVER HILL.—Owing to some little detention, sinking the main incline has made only two feet per day for several days past. The incline is down 792 feet perpendicular, and lacks only 18 feet of reaching the point at which it is the intention to open the 800-ft station and level. The southeast prospecting drift on the 444-ft level from the bottom of the winze below the 334-ft level is steadily advancing, with very favorable and encouraging prospects.

OHIO.—Daily yield, 15 tons of ore. The Empire State mill is kept steadily crushing on the regular supply of ore from the mine and in the dumps. A vein of ore recently struck on the 1300-ft level continues about seven feet in width and of a fair milling quality.

BULLION.—The north drift on the 1500-ft level is steadily advancing, the face in very encouraging ledge matter. The east drift on the 1600-ft level is slowly advancing toward the ledge, the face in bad, shelly ground. The leakage of water from the mine is not at all in excess of the amount of its intense heat. The air is very bad, and the difficulties under which the advance is being made are of the worst character.

CALEDONIA.—Sinking the main shaft is being pressed ahead with the usual vigor, the bottom in good working ground. The flow of water is still quite strong, but it is easily handled by the pumps.

SAND STRAIT.—Work is resumed in this old mine on Cedar hill, under a change of management and more favorable auspices than ever.

DAYTON.—The greater part of the past week was employed in leveling up and putting in the best of working order the pumping and hoisting machinery of the mine.

Continued from page 178.

single six-inch belt, and delivers an uninterrupted stream of pulp the entire length of conveyor from battery to furnace.

Some interesting facts in reference to the Crismon Mammoth mill, the Wyoming, the property of Col. Locke, at Homansville, and other mills and methods for the reduction of the Tintic ores, are necessarily omitted, through fear of trespassing too much on your space. A few additional lines will be allowed, no doubt, for a short notice of an ingenious little machine, the invention of the proprietor of the Wyoming mill, that has been in successful operation here for the past two years. It is no more nor less than

An Automatic Ore Sampler,

Driven by the pulp falling from one conveyor to the other, at the same time sampling the stream of pulp, which sample is not only an exact representation of the ore worked, but being a definite fraction of the pulp, it gives by its weight the quantity of ore crushed in the battery. In conclusion, Tintic may be regarded as a success. Contrary to the adage that "it requires a fortune to work a mine," her claims have been opened without capital and are represented to have paid two dollars for every dollar invested. With more money and machinery, millions might be made where now only hundreds are hoarded. A. C. K.

The Mines of Eastern Oregon and Western Idaho.

EDITORS PRESS:—After many years of decadence the mines of this interior country are gradually looming up, and will ere long assume the grand proportions commensurate with their undoubted values. It is not the object of the writer at present to enter into an analysis of the causes that have for so long a period kept this vast mining region under a cloud; but simply to give to your readers a plain, unvarnished tale, and let them judge from their own common sense the worth of this country. Commencing at Grant county, in the old placer mining district of

Granite Creek,

Are many rich lodes of silver-bearing quartz, which have been brought to the light of day within a comparatively recent period, the first discovery being made about 20 months since. The ledge to which, at present, the faith of the country is pinned upon is the Monumental. This ledge is developed at a depth of 100 feet from the surface, and levels are run out 65 and 45 feet respectively from the bottom. From the start the width of the vein was but four inches wide, but of exceedingly rich rock. As depth was attained width and richness increased, and at the bottom of the shaft, at present, is a 10-inch streak of rich ruby silver, assaying from \$3,000 to \$5,000 per ton. The remainder of the ledge, two feet wide, will average about \$200. The ore is antimonial, but the extreme richness of the rock will more than compensate for the little extra expense attached to the working ores of such nature. This mine was sold some weeks since for \$50,000; half cash, balance in six months. Works for the proper reduction of the ore will be erected as soon as possible. With proper management in the works and on the ledge, failure seems impossible. There are other ledges in the district equally as good, so far as prospected, but work enough to prove the lasting richness has not yet been performed.

Work on the shaft on the

Old Virtue Mine,

Situated eight miles from Baker City, is at present suspended, owing to the inefficiency of the old-fashioned '49 pump. The shaft is down over 350 feet; as soon as possible a new Cornish pump will take the place of the old one, and operations will be resumed. When this undertaking is completed the old mine will show up grander than ever before, for the rock below the water level is of a richness that must be seen to be believed—it cannot be described. At present the old employees and "stand-bys" are working the upper levels on tribute. One company are taking out ore of such richness that they lock it up where thieves cannot break in and steal. A short time since a three days' run netted the amount of \$2,000 for another company of four men. This mine is under the management of Superintendent Hyde, who, as an economical, energetic general understander of all pertaining to the successful running of a mine, is unequalled in all this stretch of country.

The Mines of Rye Valley

Are dormant, they are in the hands of a set of old women (of the other sex) who are unable to do anything themselves and unwilling to allow those who would do anything toward making this a very lively little camp, take a hand toward its development. They have tons of ore lying on their dumps which will mill way up, and yet such is the character of many of these so-called miners that their credit is not good for even a paper of tea.

The Burnt River Mines

Are likely to turn out to be number one; while some of the ledges are very narrow and very rich, there are others that are magnificent in their proportions; many tons worked through arastras have yielded from \$10 to \$12 per ton. As a general thing they are sulphurets

bearing veins, and contain much gold that cannot be saved by the primitive method of working. The

Connor Creek

Mine, which well-nigh went to the dogs through mismanagement of one company and want of the necessary in another, is showing brighter even than in its palmy days. The different companies are now consolidated, a 24-stamp mill is in course of erection, and the forthcoming summer, under the superintendence of E. M. White, who has stuck to this bonanza through all its varied fortunes, will perform its allotted part in yielding the golden harvest that will place the status of this country beyond a peradventure.

Near the Oregon line, in Idaho, is the

Heath Silver Mining District,

Discovered about 30 months ago by some wide-awake Nevada prospectors, who knew the nature of ores. They at once liked the formation and lay of the country. Their first prospect was what is now known as the "Belmont;" the ore is chloride in all its forms. Ruth & Heath, the discoverers, have been hard at work the whole period since the discovery. They own four ledges, all of which are valuable. Ore taken from the "Belmont" the past winter would, if in Nevada, create an excitement and bring hundreds of men into the country, but here, where not one prospector or miner in a hundred know the nature of chloride, it creates no enthusiasm whatever. Other ledges in this district are being developed; in nearly every instance they show horn and native silver, carbonate and some sulphur and lead with traces of arsenic. The formation of the country is porphyry; wood and water in plenty close to the mines, and the hills are in general very steep. The ore in a ledge recently discovered favors that found in the "Richmond" mine at Eureka.

It is more than possible that the coming summer there will be some startling discoveries made that will place the owners in this promising district beyond the power of that fickle jade, Dame Fortune. CAXTON.

Butte County Mines.

EDITORS PRESS:—Forbestown still maintains considerable evidence of its former greatness when all the gulches, ravines and flats were being mined by intelligent whites, and producing large quantities of coarse gold. The many large dwellings that have not been recently painted all indicate a falling off of shipments of bullion; but yet there are large quantities of gold being taken out in this vicinity.

The Forbestown Consolidated mining company have leased their mines and 10-stamp mill to Messrs. Gurley & Co., who are endeavoring to put the claims in the best running order. Incline down about 50 feet on the ledge, which is about six feet thick. The ore is taken about 300 yards from mine to the mill by mule car and dumped above a crusher, through which it first passed before it is ready for the stamp battery.

To insure best results in the milling they have some of the best improved concentrators, and still more important, they have an experienced amalgamator from Grass Valley mills to superintend the milling. The community seems quite confident that the present company means business, and that they have taken hold of ledges that will reward their efforts with financial success.

The Union company have steam hoisting works and are down 100 feet on a ledge five feet thick. The Sagamore company, also steam hoisting, down 100 feet, ledge six feet, and all looking favorable.

Deadwood company, with steam hoisting, is going down by an incline in the ledge. Now down about 65 feet.

The incorporation books are now closed and the property leased to a San Jose company. A ten-stamp water power mill was built but not accepted; another is to be built.

About two years since, \$5,000 worth of gold was panned out from this claim in 20 minutes; one piece worth \$24, and \$2,225 from soft, porous rock.

The northern extension of Deadwood has been located, and is being prospected; and also gravel hydraulic mining near by is being prosecuted as fast as the supply of water will permit. Ohio Flat and New York Flat hydraulic claims are being worked entirely by white men, as is the prevailing custom here. Bowers & Co.'s September clean-up for the year was \$47,000. Another company on New York Flat cleaned up \$30,000.

Good Quartz

Was discovered near a year ago, about one mile from Robinson mill ranch, by some Spaniards who pulverized and panned out by hand from the soft quartz large amounts. A small mill, four-stamps, recently erected there, gives very favorable results.

Yuba and Butte Counties

Have their line near Forbestown so that a portion of the above mines are in Yuba. The whole surface of the hills from Forbestown to Oroville, and for ten miles even beyond Oroville, seems to be entirely covered with the signs of gold quartz, and probably all would be washed if water and fall could be procured.

There is a large amount of mining being done at and near Oroville, but "the heathen Chinese" is the principal operator, his main dependence

is man power; but yet he seems to be taking quite kindly to the use of steam and horse-power machinery, several steam engines being used in their gravel diggings.

Oroville, the county seat of Butte county, has a general thrift and prosperity not equaled by many of our mining towns, as it has the double patronage of farmers and miners; is abundantly supplied with stages and a railroad to Marysville.

Between Oroville and Cherokee Flat, 12 miles, there is considerable of surface mining going on; but in many places you only see the piles of washed gravel and the little mounds on which the sluices were placed; cabins and some quite good dwellings tenantless and decaying.

Oregon City,

Beautiful for situation, romantic, with abundant tree and bush shades, contains several houses, say six or ten, and a majority of them yet occupied by families, but at present it has no active mining trading or other enterprises; only claims now to have a good school, and gold in the gravel and especially in one or two valuable gold ledges that will yet pay well, when mine working takes the place of stock mining. Here also the early miners' workings are everywhere apparent and continue at short intervals all the way to

Cherokee Flat,

A mining town of the early days and a mining town of the present day, constituting of about 1,500 people, including its suburbs.

I forgot to seek out an old settler and learn why Flat was added as a surname, for the visitor to-day would have to look much to find any lever surface of earth anywhere in or near the town. The most active enterprise and chief business of the camp is hydraulic mining, which has the largest representation in the

Spring Valley Canal and Ditch Company.

They employ a mixed nationality force of 110 men, use 2,200 inches of water, and 13 chiefs, situated so as to shift the water to different parts of the diggings, and allow men to clean up bedrock. Everything is reduced to system and economy. The yearly clean-up amounts to \$400,000 to \$450,000. Their supply of water is obtained from the head-waters of Feather river and main Butte creek, and conveyed by ditch 54 miles. To cross the Feather river, about a mile above town, the water enters an iron pipe, 30 inches in diameter, and passes down the mountain side and across the river bottom and up the hill again to the height of 856 feet perpendicular pressure, where it again enters their ditch. The pipe is made of boiler iron rolled in Pennsylvania especially for this company. The company have gravel that is supposed to be enough to furnish employment for the next 100 years.

To make room for their debris in the valley below, they were obliged to purchase 16,240 acres of agricultural lands. They now have secured as tail-race outlet, the distance of 41 miles. On Dry creek they have 22 miles of levee five feet on top, and four to six feet high. I saw at the company's office eight or ten splendid white diamonds, just as they were found in the black sands; one of them, valued by J. W. Tucker at \$150. They have found quite a large number and are yet expecting to find one to eclipse Kohinoor, as California must excel in everything.

T. L. Vinton's hydraulic claim below town, near Pentz's ranch, has just started up, getting his supply of water from the Flea Valley Mill and Flume Company. This latter company, under the superintendence of Messrs. Taylor and Allen, are fluming lumber down to Pentz's ranch, where they will erect extensive shops for cutting their lumber to order, planing, etc.

Pentz's ranch, so beautifully situated at the edge of the valley, in a climate mild and agreeable, where even oranges thrive, will now become quite an active little business place. The mining, fruit, farming, lumbering, and mechanical interests seem to all be destined to meet at this point and help to make a village, where now there is only a wide opening for one to spring up.

The Great Mining Machine

Of Messrs. Hedge & Walker is the great marvel, and new departure in all the ways ever yet tried for river mining, and Oroville has the honor of its first introduction, being built there and now being used in the Feather river, just below town. Many are coming from different parts of the State to see it work, and all seem satisfied it is the right principle and a success. A description worthy of its merits would make my communication too long. The results are so great, and the agencies so simple, it leaves the beholder lost in wonder and admiration.

B. W. C.

Oroville, March, 1877.

Change in Situation of Iron.

EDITORS PRESS:—Having read a great many accounts of the Ashtabula disaster and the probable causes, I should like to make a few suggestions through your columns, the result of my observations in iron and its qualities for years.

I noticed that the report of the Civil Engineer Committee, appointed by the Ohio Legislature, was that the workmanship and material of the bridge were of superior quality with few exceptions; that the braces were insufficient and doubtless gave way first, yet it must be borne in mind that this bridge has stood the

strain for years of much heavier trains than the one that broke it, and colder weather.

About the commencement of our war I worked in an Eastern establishment where many large beam straps were forged for walking beams to marine engines; these beam straps are forged by piling up a large bundle of plate iron three or four feet long, and then welding them together, another bundle is then added to the end of this and welded and so on to the end. This process requires a long time and a great deal of hammering under the steam hammer, and on two occasions when forging a large strap when nearly completed the further end from the hammer or the end first made dropped off, breaking apparently as easy as a pipe stem; the iron when broken looked coarse and crystallized and was undoubtedly caused by the constant jar of the hammer for days.

Again, for 14 years I have been engaged in quartz milling, where I have observed the same effect of jar on iron; a set of new stamps will usually last about one year working constantly, then they begin to break, usually near the stamp head or base, where most of the strain and jar comes; after the first one, we expect more to break at any time, as they generally all do. I have known two out of sixteen stamps to break in one night; they are more apt to break in very cold weather, but it is not unusual for them to do so in summer.

The bolts of a stamp battery are affected in the same manner, but requiring a longer time and depending on the solidity of the frame-work, but usually after three years they begin breaking near the head or nut. The iron of these stamps and bolts where broken presents the same appearance as the beam straps before mentioned, coarse grained or crystallized. In conclusion, if beam straps, stamps and bolts become brittle after a certain amount of jar, why not a railroad bridge? for there is a longer strain and jar while the train is crossing, of course the jar is not constant and consequently a much longer time is required to make the same changes in the nature of the iron.

Julian City, San Diego Co., Feb. 19th.

The Bonanza.

For months past the center of attraction on the Comstock lode has been the development and opening up a new level in the Consolidated Virginia and the California mines. The very air was rife with theories and speculations as to the continuity of the great ore bonanza below the 1550-foot level. It is true that two winzes had been sunk on the ore vein, a distance of 380 feet apart, both of which had penetrated ore, one to the depth of 127 and the other 143 feet. But those had afterwards partially filled with water, and the sincerest assertions of those who had visited and inspected the ore in the winzes was taken with many grains of allowance, and by some discredited altogether.

The Gold Hill News says that no mines in the world of the same vast extent and similarly situated were ever more systematically and energetically worked than these. And yet with years of experience and a management unequalled, the opening of the 1650-ft level was delayed at least six months beyond not only the expectations of the public, but that of the owners themselves. This delay was caused by a perfect lake of water encountered in sinking the C. & C. shaft. Whole months of delayed and retarded progress was lost sight of by the outside public, while the managers were carrying on the unequal contest and struggling for the mastery. So that when at last the Consolidated Virginia was obliged to suspend the payment of dividends and transfer a large portion of its ore crushing facilities to the California, the gathering storms of doubt, fanned and fed by the bear interests, culminated in bold unscrupulous assertions that the lower levels were a failure, and that the bottom of the grandest body of gold and silver ore ever discovered had been reached.

In order to see and understand for ourselves the full truth or falsity of these assertions, says the Gold Hill News, we yesterday accepted a kind invitation from acting Superintendent Mackay to visit and examine both mines. No restrictions of any kind whatever were placed upon our seeing and inspecting every drift and stope in either mine, and forming and expressing a candid and conscientious opinion as to the merits of both.

At a distance of about 700 feet west of the C. & C. shaft the 1650-foot drift cut the east clay wall of the ledge and immediately encountered ore. After passing through 28 feet of ore that gives an average assay value of \$200 per ton, a horse of barren porphyry was struck 20 feet in width. Beyond this barren streak rich ore was again encountered and penetrated for a distance of 70 feet. At that point a lower grade of ore mixed with porphyry was encountered, and the drift stopped until the connection with the deep California winze could be finished and preparations made for stoping ore. Much of the last 70 feet of ore is very rich, a portion of it being ore worth \$500 per ton.

The east clay wall has the regular dip of the Comstock, and the ledge a northeasterly and southwesterly course, and is, so far as we can judge, as regular and perfect in formation as it has ever been on any of the levels above.

The horse of porphyry encountered near the east wall is identical with that found on the 1550-foot level, the only change in any of the features being, that the ore east of the porphyry is 25 feet in width, while on the 1550-foot level it was only seven feet in width. The

drift connecting with the California deep winze, bearing nearly southeast, cut through a portion of this porphyry at a distance of 80 feet from its commencement, but again encounters the ore some 70 feet before connecting with the 1650-foot drift. A drift has just been started southward in the ore vein to connect with the deep Consolidated Virginia winze. The face of this drift starts in ore that will mill \$500 per ton. It will have 100 feet to run to reach and connect with a north drift from the winze, the separation of the two points being 180 feet.

The lateral drift on the 1600-foot level of the California, extending from the Ophir line to the north winze, a distance of 420 feet, exposes for almost its entire length as rich and handsome a body of ore as any yet uncovered in the mine. The solidity, size and richness of this vein, to within 50 feet in depth of the 1600-foot level, is confirmation almost positive that the vein, when developed further to the southward, will prove all that the most sanguine believers in worth predict.

The porphyry and low-grade ore now in the face of the 1650-foot drift, corresponds exactly with a small streak of porphyry cut through on the 1550-foot level in the same portion of the ledge, and it is believed by those familiar with the make of the vein that an advance of a very few feet more will carry the drift into rich ore which is likely to continue to the west wall, a distance of nearly 100 feet.

With the bottom of both the north and south winzes still in ore—one 28 and the other 48 feet below the 1650-foot level—the width, strength and richness of the vein in the California on the 1600-foot level, and the extent and richness of the ore already developed in the 1650-foot drift, no level of the Consolidated Virginia mine yet opened ever presented a more favorable future prospect than the 1650-foot level.

The ore extraction is confined for the present to the south stopes on the 1500-foot level. These stopes are 85 feet in length and about 25 feet in width and will furnish an ample supply of ore to keep the Consolidated mill running for three months to come, without touching the 1650-foot level, but are not of a sufficient extent to alone make dividends.

In the California mine there is yet a huge block of the richest of the ore, eighty feet or more in length, untouched between crosscut No. 4 and the south stopes on the 1500-foot level, while at several other different places on the same level there are considerable portions of the ore vein yet awaiting extraction. On the 1550-foot level the ore body is yet intact, with the exception of a small portion now known as the north stopes which are being mined and the ore taken to the surface through the Ophir shaft. On the 1600-foot level the ore extends fully in one undisturbed mass from the north to the south line of the mine, with the single exception of the horse of porphyry developed on the 1500-foot level, between east and west crosscuts Nos. 5 and 6, which appear to continue downward, with almost as much regularity in make and dip as the ore vein itself. We risk nothing in venturing the assertion that there are a year's dividends of two dollars per month in sight without the sticking of a pick below the present developments.

The Consolidated Virginia and California mills have just been given a good overhauling, and put in good repair, for a long and steady run. This was finished and both mills started up at noon yesterday, so that with the ore already in sight in the two mines, and the ore prospects on the deepest levels, the resumption of dividends in the Consolidated Virginia, the prosperity of both mines is an assured fact for a yet indefinite future period of time.

THE MANHATTAN MACHINE SHOPS.—The machine shops of the Manhattan silver mining company present a scene of life that in these dull times, is refreshing and encouraging to behold. Blacksmiths, turners, planers, carpenters, boiler-makers, and bosses, all hammering and belting away as though they were there for the express purpose of doing a good day's work. We could not help expressing our astonishment to the Chief W. A. Hall, at the wonderful amount of work being done, and inquiring of him whether, when the engines, boilers, friction gear, cars, cages, etc., then being made or repaired, were finished, the shop would shut down. Mr. Hall laughed heartily at our inquiry, and assured us that the work in hand, without additions, which are constantly being made, would occupy his entire force many months to complete, and that the extensive operations of the company was causing work to accumulate upon his hands faster than he was delivering it. We left the shop with a far deeper feeling of respect for the company than that evinced by the bears who are hammering away at the stock on California street, and the feeling awoke reflections in our mind as to whether all the activity which we had just witnessed might not have been created to fix up a dose for the said bears whose ultimate fate we do not envy.—*Reese River Revueille.*

TO LIGHT A CANDLE WITH WATER.—Get a very small piece of phosphorus, and with a little tallow, place it on the rim of a tumbler; next get a lighted candle, and after having extinguished it, hold it to the glass, and it will at once ignite.

PASTE FOR CLEANING METALS.—Take one part of oxalic acid and six of rotten stone; mix with equal parts of train oil and spirits of turpentine to a paste.

USEFUL INFORMATION.

Removing Gas from Drinking Water.

Mr. A. B. Bower, engineer, now working at Livermore, shows the Alameda County *Independent* what he is doing to purify the water for the supply of Livermore. It seems the water there, like that at Oakland, is offensive to taste and smell by the presence of sulphureted hydrogen. In order to remove this he has made little boxes full of small holes through which the water passes in entering the tank, and has a fall of several feet through the air. It thus absorbs the oxygen of the atmosphere, and gets rid of the mal-odorous compound just mentioned, which makes it so unpleasant. The experiment was first made with wooden boxes, but being found successful, sheet-iron boxes will be used and the holes made very small and numerous, so that the spray may come thoroughly in contact with the air and render the water perfectly pure before falling into the tank. That is one part of the plan, and one only, for it concerns merely the water as it enters the tank. But Mr. Bower has contrived additional means of purification for the water when it passes out of the tank also. The discharge pipes, which enter into the tank near its bottom, do not take the water from the bottom, where the weight of the pressure of the water and lack of motion in it tend to make it and keep it more or less impure, but extend upward to within an inch or two of the surface of the water, where the nearness of the air enables it to draw all the oxygen needed to purify it. From this high point the pipes are filled with water free from sulphureted hydrogen, and so send it down and out to wherever it is needed in a pure state. Thus, when going in as well as going out of the tank, this invention of Mr. Bower admirably answers the purpose of the inventor in putting the water into a good, healthy and pleasant condition fit for use. The same plan might with advantage be applied to the water drawn from the San Leandro reservoir, so as to keep Oakland supplied with good and pure water.

Composition of Fuel.

W. H. Northcott, in the course of a new work on "The Theory and Practice of the Steam Engine," gives a table of the composition of fuel which may be acceptable to some of our readers:

Carbon, free.	Hydrogen, free.	Oxygen, and Nitrogen, etc., free.	Ash, etc.	Water.
Anthracite coal.....90.0	3.0	3.0	3.3	0.7
Bituminous do.....88.0	4.0	4.0	3.0	1.0
Coke.....94.0	0.0	1.0	4.0	1.0
Wood, as cut.....40.0	2.0	6.0	2.0	50.0
do, air dried.....45.0	2.0	10.0	3.0	40.0
Peat, do.....48.0	2.0	10.0	10.0	30.0
Mineral oil.....84.0	15.0	0.5	0.5	0.0
Coal gas.....70.0	28.0	2.0	0.0	0.0

The compositions given in the above table are to be considered as characteristic only of the chief varieties of fuel. Each kind of fuel varies very considerably in composition, and an exact determination of the value of any particular fuel can only be arrived at by actual analysis or calorific testing. It must also be borne in mind that coal and coke deteriorate in thermal value during transit and storage. In the case of coal, exposure to atmospheric influences leads to the dissipation of its more volatile constituents, and in the case of both coal and coke the percentage of contained water is increased by the abstraction of moisture from the air. When so many pounds of water are said to be evaporated by a pound of coal, unless the composition or kind of coal is stated, the best quality is generally to be understood.

VARNISH FOR UMBRELLAS AND WALKING STICKS.—We annex two methods of coloring and varnishing sticks and paper which the *Mechanics' Magazine* recommends strongly. No. 1. Use Judson's simple dyes, they are so clean and moreover so economical in their application, that I believe they will take the leading part in all work of fancy or intricate workmanship. Put the stains on with a camel's hair brush, diluted with water. For dark stains use copal varnish. For light woods use the light crystallized varnish, such as is used for the tops of washstands, etc. Old damaged sticks that were varnished should have the varnish eaten off with liquor ammonia, then rinsed, scoured, stained and varnished again. 2. Make a solution of three parts of glue in 100 of warm water; to this add one part of whiting and two parts of orange chrome. Mix well. Apply with a soft brush to your sticks. When thoroughly dry rub down with a piece of dry flannel. Apply a second coat of color if deeper tints be required, or use burnt umber and brown ochre for oak tints. When dry, apply the following varnish: Coarsely powdered copal and glass, each four ounces; alcohol, 64 O. P., one pint; camphor, one-half ounce. To be heated over a watery bath, with constant stirring, until the copal is dissolved. When cold, decant the clear portion. Be careful that the alcohol does not inflame.

SALICYLIC ACID AS A SYRUP PRESERVATIVE.—M. Lagou, after a series of experiments to determine the minimum percentage of salicylic acid to be added to fruit syrups to prevent fermentation in hot weather, reports the proper quantity of acid to be equal to one-one-thousandth the weight of the sugar contained in the syrup.

DRIED POTATOES.—A German journal thus describes the manufacture of "dried potatoes," as conducted at Carsten's works at Lubeck: The potatoes are peeled with the hand and cut into disks by a machine. These are put into a basket and this into a boiler, where the potatoes are nearly but not quite boiled. The disks are next put on wire frames in a dry oven, where they are dried quite hard. It is important to preserve the color of the potatoes, and to prevent their turning gray, as they would by the above process alone. The material, after slicing, is treated with cold water, to which has been added 1 of sulphuric acid or 1 to 2 of muriatic acid. Then it is washed in pure water and the drying proceeds. The preparation obtained, which has lost none of its starch, is of a slightly citron-yellow tint and transparent like gum. Boiled with water and a little salt it is said to resume the natural color and fibrous structure of potatoes, and is not distinguishable in taste from the newly boiled vegetable.

MOROCCO MANUFACTURE.—This branch of our industries is considered to-day as one of the most prosperous in the country. It forms a most important branch of one of the greatest industrial interests of our entire country, namely, the leather trade, the annual product of which is rated at \$225,000,000. The number of goat skins in the hair received at the port of New York during the year 1875 was 3,728,930; being, as compared with the receipts of 1874, a falling off of about 97,260. The average price of these skins for the entire year was a trifle higher than in 1874. These skins are imported from Curacao, Tampico, Matamoros, Vera Cruz, Buenos Ayres, Payta, Cape and Calcutta, the largest number being sent from Curacao, Matamoros, Vera Cruz, and Calcutta. Curacao furnishes the skins which are chiefly used in the "kid finish," the Tampico being used for "pebbles." The finest quality of skins are said to be those imported from Payta.

SUBSTITUTE FOR PLASTER OF PARIS.—Best whitening, two pounds; glue, one pound; linseed oil, one pound. Heat altogether, and stir thoroughly. Let the compound cool, and then lay it on a stone covered with powdered whitening, and heat it well till it becomes of a tough and firm consistence; then put it by for use, covering with wet cloths to keep it fresh. When wanted for use, it must be cut in pieces adapted to the size of the mold, into which it is forced by a screw press. The ornament may be fixed to the wall, picture-frame, etc., with glue or white lead. It becomes in time as hard as stone itself.

NEW IRON AMALGAM.—Sideraphthite is the name of a new iron amalgam which is composed of 65 parts iron, 23 nickel, four tungsten, five aluminum, five copper. It resists sulphureted hydrogen, is not attacked by vegetable acids, and only slightly by mineral acids. It is really more useful than standard silver, while it can be produced at a cost not exceeding that of German silver. For alloys which have to be silver-plated to prevent oxidation, the inoxidizable iron, as the above is called, is stated to be a perfectly successful substitute.

GOOD HEALTH.

Notes on Chronic Disease.

A writer in the *Herald of Health* takes a hopeful view of escape from those permanent ills under which many are suffering. He says: Chronic disease, in the general acceptance of the term, is simply a condition resulting from a want of life, force or vital energy within the physical system, not organic, but functional in character; and hence curable. But how curable? I answer, by simply supplying the deficiency of life force, or vital energy. But can life force or vital energy be supplied to the physical system to meet a deficiency? If so, how? I answer, by simply supplying the physical system with proper food. I answer, that the physical system as a single organ has one general, dominant function, viz.: to develop or produce life force, or vital energy, from proper, assimilable food. I answer, that life force can have no other origin than from proper, assimilable food. And I repeat, that the paramount function of the human body, as a single organ, is to develop from proper food material this life-awakening and life-sustaining power.

From this point of view the fatal error of the past is clearly seen and understood. Nostrums, drugs, arbitrary and pernicious rules and systems are seen usurping the place that can naturally be filled only by food.

In a reform in the dietetic system of the present age is found the only true remedy for chronic disease. But this reform must be based upon natural, philosophical principles. Physiological laws must be obeyed.

Life force has its origin in food; but in food of a peculiar character. The human body has its active and passive organs. What a steam engine or water wheel is in a manufacturing establishment, the nervous tissue is among the other organs in the human body. It is the life-awakening and life-enduring agent. It is the life motor, the life engine. The other organs move and act only as they are moved upon and actuated by its power. Its function is the general, universal function of the human body, and it requires food to supply its waste in proportion to its activity and energy. Hence the natural

demand for food to supply the waste of the nervous tissue is proportionally much greater than for any other form required by the physical system. And the almost utter deficiency of nerve and brain food in the diet of the masses naturally suggests physical debility and mental incapacity; just those physical and mental conditions that are known to civilization by the term chronic disease. And to make the disaster more complete, unnecessary elements in the form of fat-forming and muscle-forming material are substituted for the natural, necessary supply requisite for the nervous tissue. What then is the true secret of physical and intellectual health? I answer, first, to supply the waste in each tissue of the physical system with a requisite amount of proper assimilable food; and second, to avoid burdening the organs of digestion with an excess. Here is the true philosophy of the dietetic science. It may all be summed up in seven words; supply the waste in the physical system.

The possibilities of dietetic science as a means of uplifting the human race are practically illimitable. A healthy physical system is to-day the exception, rather than the rule. That the divine capabilities of the human soul can only find a just expression through a perfect physical organ, is a fact that is not at present in any just degree understood. That chronic disease is almost invariably only a just punishment for a violation of natural dietetic law, rather than a natural sequence of intellectual culture and refinement, civilization fails to comprehend. Till a just understanding and appreciation of its true cause and proper remedy is entertained by the public mind, this scourge will continue to visit upon the transgressor the just penalties due to a violation of the most important fundamental law of human existence.

Lunch in the Shop.

To the workman from "twelve to one" means lunch, a newspaper and rest—perhaps a dive into a restaurant and a hurried meal. For the apprentice it is the swallowing of a sandwich and a piece of pie, with an hour's loafing. The *Iron Age* notes that to the workman the lunch time can be made both valuable and pleasant, especially when the lunch is taken in the shop. Instead of glumly getting away in a corner and bolting his tin of tea and the contents of the dinner pail, he should make more of a social affair of it. He will always find his companions ready to bear him good company, if he manifests a desire to be sociable. Something at once interesting and profitable can be found for discussion, and the thousand and one conundrums of the trade brought up for solution. At such times the apprentice should come in for his share, and if workmen are kind and boys show any aptness for learning, a great deal of good can be done with the spare time of the hour at noon. In smaller shops, in weather when play is not agreeable or when work is hard and rest is needed, reading is a resource upon which one can fall for never-ending amusement. We do not mean the dime novel, however. If pleasure and profit are to be combined, something should be taken up that has a bearing upon the trade; if it is desired to have light literature, stories, novels and the like, by all means let them be first-class. The injury done by reading really first-class works of fiction is very slight, and when a person has acquired a taste for it there is very little danger of harm from the cheap trash. At the present time good literature is as easily accessible as poor, and an employer could not do better for the young men under his care than to place within their reach a cheap, well selected library of standard works. The cost of such a library is at the present time small, and the labor of getting it together a mere nothing. Some manufacturers that we know regularly supply their workmen with books and newspapers at club rates or at the lowest wholesale prices, and in this way the men have the best of uses for their hour at noon in reading the current literature or in studying books, which, but for the discounts obtained for them, they would hardly be able to afford.

Hints for Poor Sleepers.

Poor sleepers, says the *Herald of Health*, will find it advantageous often to raise the head of the bed a foot higher than the foot, and then to sleep on a tolerably thick hair pillow, so as to bring the head a little higher than the shoulders. The object of this is to make the work of the heart in throwing blood to the brain harder, so it will not throw so much. A level bed, with the head almost as low as the feet, causes an easy flow of blood to the brain, and sometimes wakefulness, when the vessels cannot contract on it and keep the brain empty.

Then the bed itself should be good. A very hard or very soft bed is not the thing. Hair mattresses are generally best, but these might be improved. Then the bedding should be porous, so as to allow free interchange of air. Air-tight beds are bad. So, too, the room should be large and airy, and the feet kept warm, and persons with a sensitive skin should have as light clothing as possible. Heavy clothing sometimes keeps the sensory nerves of the skin so active, that they send to the brain sensory currents that keep this organ active.

Whether sleeping with the head to the north makes any difference we do not know. It seems in some cases, and in others not. It may be well to try it. Generally sensitive folks sleep better to have a bed to themselves.

MINING SCIENTIFIC PRESS

W. B. EWER.....SENIOR EDITOR.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTION IN ADVANCE—Postage paid—one year, \$4; six months, \$2.25; three months, \$1.25. Remittances by registered letters or P. O. orders at our risk.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:

Saturday Morning, March 24, 1877.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Notices of Recent Patents; Diamond Stone Saws; Items of Interest from the Mines; A Warning, 177. Comstock Papers; Timbering the Mines; Adverse Claims to Mines; Ionite—A New Mineral; Decisions of Interest to Miners; Legitimate Mining in Mexico, 184. Comstock Papers—No. 20; Ruffed Grouse; Air Compressor, 185. Patents and Inventions, 188.

ILLUSTRATIONS.—Emerson's Stone-Sawing Machine, 177. The Ruffed Grouse, 185.

CORRESPONDENCE.—Tintic Mining District, Utah, 178-182. The Mines of Eastern Oregon and Western Idaho; Butte County Mines; Change in Situation of Iron, 182.

MECHANICAL PROGRESS.—Hydraulic Welding; The Promethor; A New Mode of Shipping Guns; Gauging Cylindrical Bodies; Filing to a Line; Millions in Butons; A Used-up Railroad, 179.

SCIENTIFIC PROGRESS.—"Late Theories on the Earth's State"; Essay Prizes, Danish Academy of Sciences; Limestone Formations; The Brains of Criminals; A Problem in Oil Gas; A Wonderful Species of the Cotton Plant, 179.

MINING SUMMARY from the counties in California, Nevada, Arizona, Colorado and Montana, 181-88. **MINING STOCK MARKET.**—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends; Review of the Stock Market for the Week, 180.

USEFUL INFORMATION.—Removing Gas from Drinking Water; Composition of Fuel; Varnish for Umbrellas and Walking Sticks; Salicylic Acid as a Syrup Preservative; Dried Potatoes; Morocco Manufacture; Substitute for Plaster of Paris; New Iron Amalgam, 183.

GOOD HEALTH.—Notes on Chronic Diseases; Lunch in the Shop; Hints for Poor Sleepers, 183.

GENERAL NEWS ITEMS on page 188 and other pages.

MISCELLANEOUS.—The Bonanza, 182-3. The Muhattan Machine Shops; To Light a Candle with Water; Paste for Cleaning Metals, 183. Rights of Stockholders; Mining Prospects about Dutch Flat; Triumph for American Plovers; Hotel Cars, 183.

NEW ADVERTISEMENTS.

Averill Mixed Paint, California Paint Co., S. F.; Hyatt's Life Balm, Hyatt & Hyatt, N. Y.; Improved Vertical Engine, W. H. Ihmen, S. F.; Notice of Removal, Klamath Quartz Mining Co.

Comstock Papers.

In this number of the PRESS we conclude the series of articles entitled "Comstock Papers," which have been continued some time. The articles have attracted considerable attention, as they have contained many facts concerning the early history of the celebrated Comstock not generally known. Their compilation has been attended with more difficulty than one imagine, as there are so many conflicting opinions regarding many of the facts presented. In such cases it has, of course, been necessary to interview a good many people in order to reconcile conflicting statements. From the nature of the thing the early history of the lode has been somewhat shrouded in obscurity, as the people who were prominent at the time have scattered all over the world and many of them have passed away.

The results of deep mining on the famous ledge have been such as to draw the attention of the world to the locality, and therefore its early history has been a subject of interest. The articles which we have presented have in a great measure cleared up and made a matter of record many of the facts which were not generally known; and the way the articles have been received is very complimentary to the author—one of our best mining correspondents. He has worked on to permanent record in our journal much of value and interest to the future generations in that locality.

We hope that if any of our contemporaries or our readers have any facts bearing on the subject which we have omitted they will make them public. The future history of the lode will be recorded by a very able local press; but we desire to complete the work we have commenced of recording all of interest that may have transpired in the early days, should anything be wanting, from what we have already published. Accordingly, if any one is in possession of any further facts bearing on the subject we shall be glad to give them publicity.

Timbering the Mines.

With the opening up of the Comstock lode there was introduced not only a more cheap, simple and expeditious style of amalgamation, but also a new and improved plan for timbering the mines. As depth was attained in the Ophir ground the great expansion of the ore body rendered it apparent that the widely separated walls of the mine could not longer be sustained by recourse to the Mexican method of leaving massive pillars of ore, nor yet by the plan more common in Europe of constructing solid masonry for that purpose, the former involving the loss of too much ore and the latter being too expensive for adoption in a country where labor and material were so costly. To attain single sticks of timber sufficiently long and possessing at the same time the requisite strength was impracticable.

In this emergency Philip Deidesheimer, then the superintendent of the Ophir, devised a method of timbering, alike cheap, novel and effective. He employed strong, square pieces of timber placed at such angles and so framed into each other as to afford the greatest possible supporting power, while the structure resisted pressure from whatever direction it might be exerted. These sticks which consisted of posts, caps, side-pieces, sills and braces, composed, when put together, a system of rectangles four feet wide and six feet high in the clear, and which could be readily extended in every direction as ore excavation proceeded.

This plan was first introduced into the Ophir mine in the fall of 1860, having soon after been adopted by all the other companies on the Comstock, where it is still retained, and whence it has since spread generally over the coast. At the time this mode of timbering was first employed in the Ophir the vein was 64 feet thick, the superintendent who preceded Deidesheimer having left columns of rich ore of a corresponding length and many feet in diameter to sustain the walls, all of which were removed upon the introduction of the new plan.

In some of the Gold Hill mines they had, before this, undertaken to splice the timbers, but the gave way, though only 35 feet in length, and killed several workmen, demonstrating the need that existed for some better and safer method of doing this work; and securing the general adoption of Deidesheimer's system as soon as it was invented, that gentleman never having sought to secure it by patent, though probably a patentable invention.

Adverse Claims to Mines.

In the issue of the PRESS of February 10th, in speaking of the common custom of locating claims for friends we stated that in case of any legal proceedings it would perhaps be necessary for the owner to be in the district. In the article referred to occurred the following paragraph: "Some time in 1873 the Commissioner of the Land Office rejected an adverse claim to a patent, because it was not sworn to as required by law in the district where the land was situated. If we remember aright it was in the case of the Dardanelles company in Gold Hill, Nevada, when they applied for a patent for the Bosphorus. The California company filed a protest through its President. The protest was sworn to before a Commissioner of Deeds for Nevada, but was sworn to in this city. The Commissioner ruled that the law required an adverse claim to be sworn to before some officer authorized to administer oaths within the land district where the claims were located, and the adverse claim was accordingly rejected."

The Secretary of the Interior has just rendered a decision which reverses, or rather modifies, the former decision of the Commissioner of the Land Office. This was in the case of the Cornish mining and reduction company vs. applicants for patent for the Slide lode, Central City, Colorado. (The Denver and Central City land districts both exist in Boulder county.) In this case the Commissioner's rejection of the adverse claim, because not sworn to within the district where the mine was located was overruled. The Secretary of the Interior held that an officer authorized to administer oaths within a land district (as a County Clerk), may administer the same without the district, but within his jurisdiction. The case of the Dardanelles mining company vs. the California mining company, Copp's mining decisions 161, (where adverse claim to mine in Nevada was sworn to in San Francisco), was held inapplicable to the case.

This is the case which we referred to in our issue of February 10th, and it will be seen that although it was held inapplicable in this particular instance, the principle of the thing has been changed by the decision of the Secretary of the Interior given above.

"MECHANICAL ORE CONCENTRATION."—Mr. Cazin's continued article on this subject is deferred this week, as an engraving intended to accompany it was not finished in time.

THE will of Joseph L. Lewis, of Hoboken, leaving \$1,000,000 to the Federal Government, to help pay the National debt, is to be contested by a person who claims that his wife is a niece of Lewis.

THE sales in the San Francisco Stock Board last week aggregated \$2,400,000.

Ionite—A New Mineral.

[Written for the PRESS by SAMUEL PURNELL.]

In the plicene, argillaceous lignite of Ione valley, Amador county, California, a peculiar mineral, more or less pure, occurs in thin seams. The specimen examined by me was of what may be called the best quality. It is a firm, earthy, ochreous looking substance of a brownish-yellow color. As it comes from the mine, it contains about 50% of water, but when thoroughly air-dried it readily floats on water, its specific gravity being about .90. It rapidly re-absorbs water and sinks.

It bears a physical resemblance to the pyropisite, of Kengott, found in the lignite of Weisensfeld, and like it, melts to a pitch-like mass which burns easily, with the emission of a dense black smoke, having a resinous and aromatic odor, and with a yellow flame. But that it is not pyropisite, or indeed any mineral heretofore described, will, I think, be plain from the examination.

Ionite is not a pure hydrocarbon, as it contains 13% of impurities—principally aluminium silicate. Streak, reddish-yellow; fracture, irregular; luster, none. When pulverized, water dissolves or suspends a portion of the clay in the mineral. Partially soluble in cold alcohol; more so in boiling alcohol, giving a brown solution. Upon the addition of water no precipitate is deposited, but the solution becomes permanently of a milky color, which may be from the presence of paraffine.

Very largely soluble in ether, forming a brownish-black solution. Upon adding water a brown, tarry substance is obtained, which is very inflammable, and which, while burning, gives off the odor of burning sealing wax.

Completely soluble in chloroform, except the clay or ash, forming a brownish-black solution. Poured into water a brown oil falls to the bottom.

Partially soluble in cold, more so in boiling oil of turpentine, forming a wine-red solution. Upon concentration of the solution, crystals of paraffine are separated.

Almost entirely insoluble both in cold and boiling petroleum naphtha. Gives a pale red solution.

In boiling rectified petroleum, free from naphtha and paraffine, slightly more soluble than in naphtha. Gives a pale red solution.

Subjected to dry distillation a brown, tarry oil passes over, mixed with green colored water. This water is decidedly acid to litmus. At first the oil has a specific gravity less than that of water, but after a few days sinks in the same. This oil and water possesses a very offensive odor, altogether indescribable. The oil is completely soluble in alcohol and oil of turpentine. Tested for paraffine, the oil was proved to contain it, though only in small quantity. I am of the opinion that the amount does not exceed 5%, but this was not determined accurately.

From the examination this mineral may be pronounced an acid hydrocarbon, or fossil cerite, more or less oxidized and more or less impregnated with clay. From its varying solubilities, it is probably a mixture of different hydrocarbon compounds.

As this mineral is found in Ione valley, I would propose to name it from the locality, *Ionite*. To what industrial uses Ionite may be applied, has not yet been investigated, and it is foreign to the purpose of this paper to inquire.

San Francisco, March 16th, 1877.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from prominent mines have been as follows: California, March 14th, \$261,073.72; first shipment for March account; Con. Virginia, March 14th, \$79,583.30; first shipment for March account; Modoc, March 12th, \$5,230—total to date, \$20,938; Northern Belle, March 11th, \$14,691.32; Tybo Con., March 9th, \$15,995.84—total to date, \$25,171.19; Arizona, March 11th, \$2,132.06; Northern Belle, March 15th, \$8,350.15; California, March 17th, \$35,719.39—total to date, \$420,596.22; Con. Virginia, March 19th, \$17,419.54—total to date, \$122,808.52; Grand Prize, March 17th, \$6,500; Tybo Con., March 13th, \$9,760.36—total to date, \$34,921.55; California, March 19th, \$210,681.05—total to date, \$631,278.27; Con. Virginia, March 19th, \$45,758.03—total to date, \$168,566.60; Modoc, March 18th, \$8,141—total to date, \$38,339; Grand Prize, March 20th, \$11,000; Leopard, March 19th, \$4,500; Manhattan, March 21st, \$10,600; Northern Belle, March 18th, \$13,414.44.

FIRE INSURANCE.—We are pleased to call the attention of our readers to the assurance agency of Cross & Co., of San Francisco. This firm represents the London Assurance corporation, which is the oldest company doing business in the United States, and the wealthiest. It was established in 1720 and has assets to the amount of \$15,000,000, exclusive of capital unpaid. It transacts fire insurance and does business all over the State through local agencies. This corporation has been represented on this coast five years. Another company represented by Cross & Co., is the Western Assurance Company. This is the strongest Canadian company. It is young, as are all Canadian companies. It has made its deposit of \$120,000 with our insurance authorities, according to law, for the security of policy holders. We have insured with Cross & Co., and thus show our confidence in them.

Dio Lewis.

We are pleased to announce that Dr. Dio Lewis and wife have transferred their residence from Boston to Oakland, and thus become citizens of California. The grand work which Dr. Lewis has done for the advancement of sound ideas and practices of hygiene is well known to our readers, from the many good lessons of his which have been presented through our "Good Health" columns. This work has also won for him a national reputation. Long and excessive mental labors prostrated the diligent friend of humanity, and one year ago Dr. Lewis and wife came to California, and with a small camping party made a tour of the southern part of our State, and visited Yosemite and other notable places. The long cruise in our bracing air and invigorating sunshine gave Dr. Lewis and wife back to Boston feeling fully restored in health. But the severe winter made doubly dear the thought of California to them, and the month of February brought them back to us for the future. When such men and women, who have earned such enduring fame for their good works in the older States, turn to California for a second youth and a permanent home, who can gainsay the merited reputation of our land? Our fair landscapes, our beautiful vernal winters, our pure air and the cordial welcome of our generous and open-hearted people are winning us friends among the best of the world. Such friends in turn aid us greatly in the development of our State. We doubt not the doctor's honest enthusiasm will call forth some of his most eloquent language concerning the advantages of a California home, and thus his efforts will prove equal to a score of immigrant societies to populate our beckoning fields and workshops with a prudent handed and brain-working people, many of whom, even with their late arrival, will outstrip some of the old '49ers in the honorable race toward a permanent prosperity.

Decisions of Interest to Miners.

We make the following abstracts from recent decisions of the Secretary of the Interior:

In the absence of fraud, an application signed by two or more joint owners of the claim is valid.

The act of an attorney in the legitimate prosecution and adjudication of cases, is the act of the claimant himself.

Commissioner's decision, that no necessity exists for his further suspension of proceedings, by reason of abandonment of surface ground concerning which, adverse claim was filed and suit commenced, overruled; held, that as surface ground may be only an incident of the suit, to issue the patent would be an evasion of the law, which directs that the case be finally adjudicated in the courts, or the adverse claim waived.

A second suit, begun after expiration of publication, cannot bar issue of the patent.

The title being contested, Commissioner's suspension of application until the applicant establishes a right of possession, approved.

An appeal from Commissioner to Secretary can be taken only by a contestant—who files an adverse claim. Such appeal can not be taken by a protestant—who did not file on adverse claim, but who objects to the grant of a patent. Case of McGarrahan vs. Boston quicksilver mine cited and approved.

Confession of judgment by defendant in the suit, (who is applicant for patent), ends the suit. The applicant then may abandon surface ground in dispute and receive patent for all that part of the mine to which he is legally entitled.

Legitimate Mining in Mexico.

We learn from private sources the following items concerning Mexican mining matters: The merchants of Mazatlan, finding that business was dull, have thrown some money together, and propose resuscitating the old mines of Panuco, about 90 miles to the southeast of the city. There are only 24 shares in the company. They have elected Don Antonio Paredes as Superintendent, formerly the right-hand man of Bradbury, at Rosario. They have sent Cornish here to buy pumping machinery, which went back on the last steamer. The mines have a brilliant record up to 1823, when the civil war caused their abandonment.

The Durango mining company, at San Dimas, are still pushing their tunnel slowly along. Have been going ahead as for the last 12 years. The tunnel is now in about 1,200 feet.

Guadalupe de los Reyes, since the death of Don Pedro Echiguer, has been carried on by his brother, Don Francisco, and is doing well, running 30 stamps.

Near Topia, Edward Worthiman, well known in San Francisco, has made a fortunate strike. Altogether, legitimate mining in that section of country never looked better.

SUIT was entered in the First District Court at Virginia City, on Friday, to recover from the California mining company the sum of \$99,897.87, due for State and county taxes upon the bullion production of the California mine for the quarter ending September 30th, 1876. A similar suit was also entered against the Consolidated Virginia mining company to recover the sum of \$16,145.74, due to the State and county on the bullion production during the same quarter.

Comstock Papers.—No. 20.

Filling Up the Geographical Vocabulary of the Country.

How rapidly a mining excitement, through a hastened influx of population, tends to multiply the names of natural objects and localities in a country before almost without any geographical vocabulary, the movement caused by the discovery of the Comstock lode aptly illustrates. Take any map of the region now constituting the State of Nevada, published prior to 1860, and we find it well nigh a blank. Scarcely more than 50 names, all told, appear upon it. The few mountain ranges, scattered at random over it, leave us to infer that the country is an almost uninterrupted plain, a supposition strengthened by the fact that it really does form a part of the Utah basin or Great American desert. The only rivers laid down are the Humboldt, Truckee, Carson and the Walker with their several forks in the northwest and the Rio Virgin and the Muddy in the southeast, these being, in truth, all the streams that exist here of sufficient size to be styled rivers. We see thereon the names of some half dozen lakes and sinks and sloughs. Dotted lines, devious and far separated, straggle across the nameless waste, indicating the trails of Fremont, Beck with, Steptoe and other early explorers, while a single wagon road, coming in from the northeast, and following down the Humboldt, marks the route pursued by the pioneer immigration. Here and there is put down on these early maps a saline or thermal spring, a mud lake or a soda lagoon, the only towns or settlements appearing thereon, being the old Mormon station, now Genoa, Franktown, in Washoe valley, Ragtown, standing near Carson river, on the southern edge of the Forty-Mile desert and Chinatown, situated at the junction of Gold canyon and Carson river, near the point where the old immigrant road crosses the latter. Upon these early and almost vacant charts, are put down neither townships, counties, nor other political divisions; all that is indicated in this direction being that the country belonged to Utah Territory, being generally denominated Western Utah.

Progress of the Work
If now we look upon the map of this region, 18 years ago so nearly a blank, we find it crowded with names. First, we have the Territory as an entirety organized into the State of Nevada with fourteen counties, some of which have been in part subdivided into townships. A multitude of mining districts appear, covering a large portion of the State, being those that still maintain their organization, such as were formed and afterwards disbanded through diminished population, or, as sometimes happened, through entire desertion, having been dropped from the more recent maps. Scores of towns and mining camps present themselves, some of the former being of very respectable dimensions, both as regards business and population; Virginia City and Gold Hill, which are really but one place, containing about 25,000 inhabitants, while Carson City has over 5,000. Such additional lakes and streams as have since been discovered, as well also as the principal mountain ranges and passes, the more noteworthy springs, the borax beds and other remarkable salines have all been looked after and duly named.

Scanty Material.

In this christening process the Washoe argonauts have had to rely mainly upon their own linguistic resources, there having been here no previously existing Spanish and but a scanty Indian nomenclature, as in California, to help them out. There were, to be sure, names of aboriginal origin attached to some of the higher peaks and ranges, and also to a few other of the more remarkable natural objects, but the adoption of these, except it a few instances, was by the whites deemed inexpedient because of their great length, their harsh and guttural sounds or their awkward pronunciation. The Rio Virgin (already half anglicised), a small stream in the southeastern part of the State, and Las Vegas, meaning the meadows, in the same vicinity, appear to have been the only terms derived from the Spanish to be found on the early maps of all this region, the christening of these having been due to their lying along the old Spanish trail leading from Santa Fe to Los Angeles, and not because there had ever been any settlements made here by that people.

Of the Indian Names that Have Been Retained,

We have, first, *Tahoe*, applied to the large lake in the Sierra Nevada mountains, about two-thirds of it being in the State of California.

The term, in the native tongue, means big or beautiful water, and adhering to the Indian rule should be divided into three syllables and pronounced Tah-hoe-ee, with the accent on the last, and not in two syllables, with the accent on the first, as we absurdly practice. The observance of the method first mentioned besides being more in consonance with the analogy of the aboriginal tongue, would impart to the word a much more poetic and euphonic sound. The newspaper press should attend to the correction of this mistake. Washoe, the name of an Indian tribe who formerly inhabited a series of valleys lying along the eastern base of the Sierra, is still retained, having been given to the principal valley in this series and also to the county which covers it, and the country adjacent. This term should have been applied to the State itself in accordance with the desire of many of the inhabitants at the time of its creation, as it had already become identified with the famous silver mines all over the world, and its adoption, apart from its eminent fitness and agreeable sound, would have prevented the many mistakes that constantly occur through the confounding of this name and that of the large and populous California county adjoining this State on the west. The Truckee river was so called after the Indian who was employed by the Donner party to guide them over the mountains into California. He appears to have been a faithful and intelligent old man, and there is little doubt but these unfortunate people would have escaped the terrible fate that overtook them, had they paid attention to his timely warnings. Shoshone, Toiyabe and Toquima, names of three high mountain ranges in Nye county, are all of Indian origin; so also is Sinkavata, a broad valley lying to the west of the Shoshone range; Winnemucca, name of a

town on the Central Pacific railroad, also of a shallow lake lying to the east of Pyramid lake, and connected with it by a slough, was the name of the principal chief of the Piutes, who lived to a great age, dying only a few years since, leaving a son who, succeeding to his name and office and who has, like his father, always maintained friendly relations with the whites. Pahranaugut is the name of a mining district situated in Lincoln county, in the extreme southeastern part of the State. It once contained quite a large population and enjoyed a good reputation for mineral wealth, but failing to sustain it by practical results the place has, for years past, been nearly abandoned.

Having but a meager vocabulary upon which to draw, the early dwellers on the "Eastern slope" being those of the pre-Comstock era, managed to make this slender stock go a good way. Thus, the name of Kit Carson, the famous Indian scout and guide, was by them applied to a river, the pass in which that stream originated, the valley through which it ran, as well as to the lake into which it disembogued and the sink where the surplus waters of the latter finally disappeared; the name having at a later date been given to a county organized in this part of Utah, and afterwards also to a city, the now flourishing capital of Nevada.

THE RUFFED GROUSE.

Among the county names of the new State only that of Washoe is of Indian origin. Esmeralda county was called after the principal mining district within its limits. The term, meaning in Spanish an emerald, was in its application here a purely fanciful and not altogether happy one. Douglas county was named after Stephen A. Douglas, then United States Senator from Illinois. Ormsby, after Major Ormsby, an early settler in Carson valley and an energetic business man, who was killed while leading the expedition against the Indians in June, 1860. Storey in like manner was named after Captain Storey, who lost his life in the same expedition. Lyon was named

in honor of General Lyon, a brave officer in the Union army, who fell at the battle of Wilson's creek, Missouri, in 1861. Churchill county was also named after a distinguished army officer, his name having before this been given to the fort, erected on Carson river in 1860. Humboldt county bears the name of Baron Von Humboldt, the great German scientist, traveler and author. Eureka and Elko were named after the principal towns they contain. Nye county was named after James W. Nye, first Governor of the Territory and afterwards U. S. Senator from Nevada, an honor that he well deserved. Lander after General Lander, of the U. S. army, who for many years was engaged in exploring the country between the Missouri river and California, and laying out wagon roads through the same. Lincoln county was named after the "martyr" President, and White Pine after the chief mining district of that region, the name having been originally suggested by a species of pine found in the neighborhood.

The Twin Rivers.

When Fremont crossed this country in his expedition of 1845, he was led to notice while passing through Big Smoky valley two large streams of the purest water, issuing each from a narrow gate-like gorge in the Toiyabe range. These gorges are but a few hundred yards apart and the two streams continuing to flow out into the valley in close proximity and parallel to each other for quite a distance, suggested the name of "Twin rivers," which was accordingly given to them by the great "Path-finder," and they were so laid down in the maps afterwards prepared by him. When the inevitable prospector arrived in that region, recognizing in these two creeks the Twin rivers of Fremont, he adopted the name for a mining district, whence it came to be applied to a considerable section of the mountains and valley adjacent; the singular form of the phrase, "Twin River," having meantime come into general use.

Reese River

Was named after Captain Reese, a Mormon, who having a home establishment at both Carson valley and Salt Lake, necessitating frequent journeys between these two points, was led to seek a shorter path than the circuitous route via the valley of the Humboldt. In carrying out this purpose he left the old immigrant road near Carson lake, and pursuing an easterly course came upon the small stream that now bears his name. Walker river and lake bear the name of one of the employees of the Northwestern Fur Co., who trapped on these waters many years ago. Pyramid lake is so called because of a high, conical rock rising from the deep water near its eastern shore. In looking over the modern map of Nevada, many streams will be seen there laid down as rivers, but they are with the exceptions already noticed, nothing but creeks, and the most of these very small

creeks at that. Reese, Twin, White and many other so-called rivers, including the Virgin and the Muddy, are everywhere easily forlorn, nor would it greatly trouble an active man to jump across almost any of them, except during their highest stages.

Ruffed Grouse.

The bird of which we give an engraving on this page will be recognized by our Oregon and Northern California readers as a denizen of their thickets. Many others will also remember it the object of their gunning in the Eastern States. The grouse, although one of the most widely distributed birds in the United States, seldom, if ever, so far as we know, appears in our Southern counties. It is known as the "partridge" in the Middle States and the "pheasant" in the Southern States.

There is a close resemblance between this bird and the domestic fowl in their natural habits, especially with respect to the rearing of their young.

Although a permanent resident in the region it inhabits, the ruffed grouse performs partial sorties at the approach of autumn, but not so extensive as the peregrinations of the wild turkey, the little partridge or the primed grouse, yet sufficiently so to be noticeable at periods when the food in some mountainous localities becomes scarce.

Although the ruffed grouse is partial to the craggy sides of mountains and hills and the rocky borders of rivers and small streams,

thickly mantled with evergreen, small trees and shrubs, they at times remove to low lands, and even enter the thickest cane-brakes, where they sometimes breed. In the spring and autumn the male often betrays himself to the gunner by a drumming noise produced by his wings, which they have been known to continue for several hours at a time, and may sometimes be heard at a distance of half a mile. Their human persecutors imitate this noise, by tapping on dry and inflated bladders, when the bird comes forth to combat a supposed rival, and is shot; and they are also caught in traps set upon their drumming ground, or logs. Different species of hawks also destroy them, particularly the red-tailed and Cooper's hawks. Skunks, weasels, raccoons, opossums, and foxes are also their foes, some of them sucking their eggs, and others feeding on their flesh.

Seeds and berries of all kinds chiefly comprise their food, but they are particularly fond of fox-grapes, winter-grapes, strawberries and dew-berries. In winter or early spring, they eat the tender buds of various

trees, and thus sometimes prove injurious to the apple and other fruit crops located near dense woods. They are then easily approached, but are too lean to be desired. About the first of September, when the mountains are covered with whortleberries and blackberries, is the proper time for shooting and catching them. Trap-boxes are then used, as well as the "figure-of-four." When the snow is deep, they often conceal themselves by diving beneath it and emerging at a distant place, but are often caught in the attempt.

The whirring noise produced by these birds when rising in alarm from the ground is not made at any other time. Its usual flight is low, straight forward, and seldom more than a few hundred yards at a time, being also stiff, and accompanied with a beating of the wings for more than half the distance, after which, it sails like a ship before the wind. It moves gracefully and proudly upon the ground, until alarmed, when it lowers its head, expands its tail, first runs a little distance, and then flies away with a whirring noise.

AIR COMPRESSORS.—We are asked by a correspondent what air compressor received the highest award at the Centennial. The awards for air compressors have not yet been received from the judges by the competitors, although the Burleigh Drill Company received notice that they had obtained an award on the air compressor as they did on the drilling machinery. As soon as the report of the judges is received we will publish it for the information of our mining readers.

RUMORS of a compromise between the Richmond and Eureka Con. companies are in circulation at Eureka. The *Sentinel* has not been able to find any foundation for them.

We can recommend the New York watch, of Springfield, Mass., as A. 1.

Rights of Stockholders.

In the case of G. S. Bowdoin vs. James T. Sanford, the Brentwood coal company et al., Judge Morrison has rendered an opinion on motion of defendants, to strike out the complaint of intervention filed by one Williams. The suit is to foreclose a mortgage for \$90,000, executed by the Brentwood coal company to Sanford, and by him assigned to the plaintiff. Williams the intervenor, avers that he is the owner of a large amount of the capital stock of the Brentwood coal company; that the defendant, Sanford, is the principal stockholder in the same and has absolute control of the company; that its trustees are subservient to all of his wishes; and that he dictates their action as such in all particulars, and has always done so; that the company is not faithfully defending its interests and rights or those of its stockholders in this action, but is purposely betraying and abandoning the same for the benefit of Sanford, with the fraudulent design of enabling him to become the owner of its property or its capital stock, and to the sacrifice and ruin of the interests and rights of the intervenor therein, and with intent to cheat and defraud the intervenor out of his rights and interests in said company. The complaint of intervention also charges that the mortgage was *ultra vires*, and was given by the corporation fraudulently, with intent to defraud and cheat the intervenor. The coal company admits the indebtedness, and interposes no defense to the foreclosure of the mortgage. The company has gone into bankruptcy since the filing of its answer, and the assignee in bankruptcy has been substituted as defendant. The question presented in this case involves the right of a stockholder to come into a court of equity and ask the interposition of the Chancellor for the protection of his rights where the trustees are derelict in duty and are about to permit the property of the corporation to be sacrificed. It has been said that the duties of trustees or directors of corporations are due primarily to the corporation; that the stockholder has no direct interest; and if permitted to be heard at all, he must appear in a representative capacity for the corporation. Judge Morrison decided that the trustees owe a duty directly to the stockholder, and quoted various authorities in support of his opinion. He said: "In the case now under consideration, the intervenor shows that the trustees of the corporation are about to commit a flagrant breach of their trust, by permitting an unjust claim to go into judgment by means of which the corporation will be deprived of the greater part, and perhaps nearly all, of its corporate property. The intervenor asks that he may be permitted to come into this court and prevent the perpetration of that great wrong by interposing an equitable defense, which will defeat the attempted foreclosure. Every sense of duty and obligation of law requires that these trustees should avail themselves of any meritorious defense they may have to this foreclosure suit. But, instead of setting up the alleged defense, they have manifested a willingness to permit the foreclosure, and thus strip the corporation of its property, and the stockholders of their interest therein. The ground of complaint here is, that the trustees have fraudulently refused to perform a duty which they owe, not only to the corporation, but to the stockholders. It is very clear to my mind, and is fully supported by authority, that the stockholders may, in such a case, appeal to a Court of Equity for the protection of their rights. The mere fact that the Brentwood coal company has gone into bankruptcy does not, in my opinion, affect the rights of the intervenor in this case. The assignee has come into this Court and has evinced the same readiness and willingness to allow this alleged fraudulent foreclosure proceeding to go forward. He has subjected himself to the jurisdiction of this Court, and whether the corporation is to be represented by dishonest trustees or by a faithless assignee makes no difference. Neither the consent of such trustees, nor that of such an assignee will justify this Court in withholding its aid for the protection of the rights of the stockholders of the company.

The motion to strike out the complaint of intervention of Williams was therefore denied.

Mining Prospects about Dutch Flat.

In an article on "Our Prospects" the Dutch Flat *Forum* says: We will lead off by giving a synopsis of Dutch Flat, its enterprises and surroundings. When we speak of its being at the present time one of the richest mining towns on the coast, considering its population, many of our readers will be surprised to learn that less than six years ago the trade of this place became so slack that nearly, if not quite, one-half of the business houses were closed up, and offered for sale for less than what it cost to furnish the lumber used in their construction. This was owing to an opinion, at that time prevalent among miners, that as the rich pay in the gulches had failed, and as the top strata of loose gravel was removed by hydraulicing the vast body of hard gravel remaining protected by high rim rock, was only rich enough, in places, to pay for drifting, and the enormous expense that would be incurred in opening them up for hydraulicing was beyond their means; and even if it were not, the lower strata, several hundred feet in depth, was of such a hard and rocky nature that it was considered impossible to remove it fast enough by water power to make it pay. But then, as time is ever kept busy in

solving mysteries, it was discovered that through the aid of powder, the gravel in those hard banks could be pulverized, and removed as readily by hydraulicing as that of the top. Then the hardy and energetic miner was not loth to comprehend that he still owned a valuable mine. Rich and enterprising capitalists, through the aid of mining experts, investigated these facts, and found therein an encouraging field for the outlay of a large amount of capital, with the chances insured for encouraging results.

The consequences are that within the last few years the industries of Dutch Flat and vicinity have undergone a sudden change, with extraordinary encouraging results. Nearly all of the vast, extensive and rich mining property which lies in the vicinity of Dutch Flat, Gold Run, Little York, Liberty Hill and You Bet have been purchased by capitalists, together with several mining ditches, at an outlay of several millions of dollars, and through the aid of Burleigh drills they have run and completed bed-rock tunnels in months, in place of years as heretofore; and to-day can be witnessed the working of nearly all of said mines through long tunnels. A great many of them are so far advanced in being opened that monster derricks are arranged on the bedrock, capable of stacking boulders, weighing as high as eight and ten tons each, out of the way. We also have in our midst numerous other rich hydraulic and drifting mines, located at Lowell Hill, Remington Hill, Alta, Green Valley, Eucher Bar, Sandy Run, Bear River, etc., nearly all of which are so owned and situated that the town of Dutch Flat derives a great benefit from their continual liberal patronage. These mines, together with the important lumbering interests, make our town a lively and prosperous place.

TRIUMPH FOR AMERICAN PLOWS.—The *American Manufacturer* says: The recent victory of American implements in Russia has some picturesque features. When Mr. Kolyzsko returned from the Philadelphia exhibition and told what he had seen, the English dealers in Russia became alarmed, and began a newspaper campaign against American implements. They especially attacked our plows, and said that English plows would be used throughout the whole continent of America were it not for our tariff. Mr. Kolyzsko challenged them to a trial, and the day and place were appointed. The English went to the spot a day ahead of time and plowed a piece of soft ground. Mr. Kolyzsko arrived next day with American plows and experts. He found that what was left to him was land of the worst nature, covered with shrubs and very uneven. Knowing what American plows were, however, he went to work at once and showed the Russians and English what they had not seen before. With these plows he cut the earth and matted roots with the greatest ease, very much to the surprise of all spectators, who decided the victory for the American plows complete.

HOTEL CARS.

Another Grand Improvement to be made by the "Pioneer" Line.

Description of the Superb Cars now being Constructed.

For some time we have heard hints of a line of hotel cars for the Omaha and California line of the Chicago & Northwestern Railway. When asked about their cars, the officers have uniformly evaded a direct reply. Our "reportorial instincts" taught us to investigate for ourselves. We have done so, and are now enabled to state positively that such a line will be started in the early spring, and that the cars are now being built. The fact will no longer be a secret after this day's paper gets before the public.

Four of the most magnificent hotel cars that have been built anywhere are now being constructed by the Pullman Palace Car Company expressly for this line. These cars will be 66 feet long, 10 feet wide and 10 feet high, with 12 sections, one drawing-room (with table room for six persons), and one state-room, besides the kitchen, china closet, dressing-room, etc. The interior will be finished with black and white walnut, mahogany, French ash and curled maple, the place of the usual head-lining being filled in with foreign polished woods; the panels between the windows will be of California laurel and other California woods; the lamp fixtures, window fastenings, door hardware, etc., will be of triple-plated silver. The upholstery of the seats is to be of rich but plain reps, corresponding and harmonizing with the wood finish of the sides and roof of the cars. Between each set of seats is space for a table that will accommodate four persons comfortably, but as a rule are not expected to seat more than two persons. The glass and chinaware for the tables are now being made at Dresden, Germany, from patterns selected from the Royal Dresden exhibit that was at the Centennial exposition and so greatly admired. Each piece of silverware, glassware and chinaware will have the monogram of the Chicago & Northwestern road marked thereon. The kitchens of the cars will be so arranged that no fumes from the cooking viands can reach the occupants of the berths. On each car will be a steward, two cooks, three waiters and a chambermaid to wait upon lady patrons. It is the intention of the company to furnish the best meals that money can buy, and choice wines and cigars will be attainable by those desiring those luxuries.

These hotel cars will leave Chicago on the California Express, and run through to the Mis-

souri river. On the west-bound train, dinner, supper and breakfast will be served. The east-bound hotel cars will leave Omaha on the Atlantic Express each day, in the afternoon. On this train supper, breakfast and dinner will be served. Thus passengers bound in either direction will be enabled to have all their meals en route and yet not leave their palatial traveling parlor.

The only objection that has been raised against the use of hotel cars has been connected with the odors of the kitchen. As we said before, this, in these cars, will be entirely obviated; no person, no matter how particular he or she may be, will have cause to make any objections on this score. In the dining car you merely get your meals, and as soon as you are through eating you are shovelled out and started for the coach or sleeper, so as to make room for some other traveler who desires your place. While in these hotel cars your berth will be secured through, you will own it absolutely for the length of your trip, and it will be your own for lounging, sitting, sleeping and eating purposes, as much as your own seat in your own house. As it is not generally known, dining cars are never run over the entire length of any route; they are taken on and set off of the train at stated meal times, while these hotel cars will be made a part of the train and run through in the same way as the regular sleeping car.

On the admirable steel rail that is now laid on the Chicago and Northwestern Railway, these elegant, 16-wheeled hotel cars will ride as easy and with as little noise or oscillation as a balloon that floats serenely through the air; and we believe that it will be found to be a result that thousands will flock to this "Pioneer Line," who have hitherto gone by some other route.

With these and other improvements the people of Cedar Rapids are very largely interested and we believe will join with us in congratulating the progressive management of this great line in this its most advanced step; and unite with us in saying, the Chicago & Northwestern Railway has become the foremost road in all the West.

These hotel cars will be placed in service about March 1st, 1877.—*Republican*, Dec. 22d, 1876.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL, MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick-silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

GREAT IMPROVEMENTS ARE NOW BEING INTRODUCED IN ENGRAVING

BY THE Scientific Press ENGRAVING CO.,

AT THIS OFFICE, WHEREBY

Good Engraving

Will be done at REDUCED RATES.

The Ingersoll Rock Drill

Is Extensively Used in the East and

TAKES THE PLACE OF ALL OTHERS,

Wherever introduced, because it can be run with less power, labor and repairs, and do more work than any other Drill in the market. It has but few parts, is easily handled, being light, and has AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

(Room 10,) 320 Sansome Street

THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at \$6.....	\$12.00
Two firemen at \$4.....	8.00
1,500 lbs of salt at 1½c.....	22.50
Wear of shoes and power.....	1.50

Cost for 15 tons.....\$44.00
Cost for one ton..... 2.93

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,
Reno, Nevada.

P. O. Address: ALAMEDA, CAL.

TULLOCH'S AUTOMATIC ORE FEEDER,

Awarded the Centennial Medal.

The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of the parties certifying to those herewith given, will establish their value and genuineness.

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone \$48 a day. Mr. Green, of the Phoenix mill (12), Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Strike companies, Plumas county, writes: From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage them; the saving in both labor and costings is fully one-half over the old style of feeding by hand. Mr. Preston writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

F. OGDEN, 22 California Street, S. F.

ARITHMETIC MADE EASY.

ROPP'S

EASY CALCULATOR

Is a new publication that must prove of incalculable benefit to Farmers, Mechanics and Business Men. It is so rapid and original as to startle the most scholarly, and yet so simple and practical that the most illiterate in figures can instantaneously become his own accountant. It enables thousands to accomplish in a minute what they could not learn to calculate in many months.

The first part contains an entirely new system of tables, which show at a glance the exact value of all kinds of Grain, Stock, Hay, Coal, Lumber, Merchandise, etc., from one pound up to a car load, and for any price that the market is likely to reach; the interest on any sum for any time at 6, 7, 8 and 10 per cent.; correct measurement of all kinds of Lumber, Saw Logs, Cisterns, Tanks, Granaries, Bins, Wagon Beds, Corn Cribs; a Time, Wages and many other valuable tables.

The second part is a practical arithmetic, and embodies a simple mechanical principle which enables any one familiar with the fundamental rules to become a lightning calculator; and by which over two-thirds of the figures and labor required by the ordinary methods, and fractions with their intricacies, are entirely avoided.

The work is nicely printed on fine tinted paper, is well and elegantly bound in pocket-book shape and is accompanied by a Silicate Slate, Memorandum and Pocket for papers. It is by far the most complete, comprehensive and convenient pocket manual ever published.

Price, bound in Fine English Cloth, \$1.00.

Sent direct from the Eastern publisher, postpaid, on receipt of price, by F. O. order, registered letter, or receipted by express. Address

G. MAHE, Director.

Buy the Best.

Before purchasing an American Watch, examine the different styles manufactured by the NEW YORK WATCH COMPANY, at Springfield, Mass. They are the latest and best improved manufacture. You can depend upon them for fine finish, durability and perfect time. They are sold at favorable prices—in fact, no higher than many of the inferior styles. Examine into the merits of this Watch before you buy any other. Our word for it, you will not regret it.

MORE ANON.

San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens, a extensive contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

Metallurgy and Ores.

JOHN TAYLOR & CO.,

Importers of and Dealers in

ASSAYERS' MATERIALS,
Chemical Apparatus and Chemicals. Drug-
gists' Glassware and Sundries, etc.

512 & 518 Washington St., San Francisco.

We would call the special attention of Assayers, Chem-
ists, Mining Companies, Milling Companies, Prospectors,
etc., to our large and well adapted stock of

ASSAYERS' MATERIALS

—AND—

Chemical Apparatus,

Having been engaged in furnishing these supplies since
the first discovery of mines on the Pacific Coast.

Our Gold and Silver Tables, showing the value per
ounce Troy at different degrees of fineness, and valuable
tables for computation of assays in grains and grammes,
will be sent free upon application.

JOHN TAYLOR & CO.

THOS. PRICE'S

**Assay Office and Chemical
Laboratory,**

524 Sacramento St., S. F.

Deposits of bullion received, melted into bars, and re-
turns made in from 24 to 48 hours.

Bullion can be forwarded to this Office from any part of
the interior by Express, and returns made in the same
manner.

Careful Analysis made of Ores, Metals, Soils, Waters,
Industrial Products, Etc. Mines examined and reported
upon. Consultations on Chemical and Metallurgical
questions.

Nevada Metallurgical Works,

21 First Street, 3 doors from Market, S. F.

Ores worked by any process.

Ores sampled.

ASSAYING in all its branches.

Analysis of Ores, Minerals, Waters, etc.

WORKING TESTS MADE.

Plans furnished for the most suitable process
for working Ores.

Special attention paid to Examinations of
Mines; plans and reports furnished.

E. HUHN,
C. A. LUCKHARDT,

Mining Engineers and Metallurgists.

LEOPOLD KUH,

(Formerly of the U. S. Branch Mint, S. F.)

Assayer and Metallurgical Chemist,

No. 611 COMMERCIAL STREET,

(Between Montgomery and Kearny,)

SAN FRANCISCO, CAL.

INSTRUCTIONS IN ASSAYING,

Chemical Analysis, Determination of Minerals, and use
of the Blow-pipe.

HENRY G. HANKS

Will receive a few pupils at his new laboratory, No. 617

Montgomery Street, up-stairs. TERMS MODERATE.

STRONG & CO.,

Assayers and Metallurgists,

10 STEVENSON STREET, S. F.

BLACK DIAMOND FILE WORKS.

G. & H. BARNETT,

Manufacturers of Files of every Description,

Nos 39, 41 and 43 Richmond street,

PHILADELPHIA, PA.

Sold by all the principal hardware stores on the Pacific
Coast. LINFORTH, KELLOGG & CO., General Agents
for the Pacific Coast.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT
for DIAMOND POINTED DRILLS, now brought to the
highest state of perfection, are prepared to fill orders
for the IMPROVED PROSPECTING AND TUNNELING
DRILLS, with or without power, at short notice, and
at reduced prices. Abundant testimony furnished of
the great economy and successful working of numerous
machines in operation in the quartz and gravel mines
on this coast. Circulars forwarded, and full infor-
mation given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 10.

Continued from page 181.

That part of the work was finished day before yesterday. Justice.—Daily yield, 400 tons of ore. The ore stops are looking well in every portion of the mine, and are yielding the usual good quality of ore. The waste sinking below the 800-ft level is still rich ore.

Succor.—Sinking the shaft is making excellent progress. The work is being pushed with great energy in order to get below the broken portion, and reach a concentration of the ledge.

Leviathan.—The face of the main north drift at the 600-ft level continues in promising vein material. The face of the drift north at the 650-ft level from the incline is in fair grade ore, which shows continued improvement.

New York.—Work on the pump compartment of the shaft is going steadily forward. The upraise has yet about 160 feet to make to reach the surface. In the meantime the tanks and the stations for the lift pumps are being put in.

Savage.—During the first part of the week a delay of the pumping operations allowed the water to rise in the main incline some 60 feet. The defect to the machinery has, however, been again remedied, and the pumping resumed.

Phil Sheridan.—The east drift on the 400-ft level is in 55 feet, the face in softer and more favorable ground. The progress is excellent, and the approach to the ore vein steady.

Imperial Con.—The main incline is cleared out and repaired to the bottom and the sinking resumed. The main north and south drift on the 2135-ft level is being enlarged and timbered.

Chollar-Potosi.—Daily yield, 100 tons of ore, the average assay value of which is \$26 per ton. Sinking the combination shaft is making the usual progress.

Phoenix.—Work suspended and mine closed at present, owing to the injunction procured by the Overman mining company, who claim the ground.

Buckeye.—Just enough ore is being extracted to keep the Hope mill steadily running. The character of the ore is not materially changed.

Alta.—Sinking the shaft is being pushed forward with steady vigor. The bottom of the shaft is in good working ground.

Utah.—The west drift at the 1150-ft level is steadily advancing toward the ledge, the face in very hard blasting rock.

Baltimore and American Flat.—The main east and northeast drifts on the 1400-ft level are steadily advancing. The face of the northeast drift shows indications of a near approach to the main ore vein.

Central.—The amount of quartz appears to be gradually increasing, some of which gives good assays in both gold and silver.

South Constock.—Shaft down 100 feet below the 300-ft level to-day. Some very fine stringers of quartz are being met with.

North Con. Virginia.—Sinking the shaft is making the best progress possible. The bottom in very favorable ground.

BULLION DISTRICT.

Active.—Eureka Sentinel, March 16: There is considerable activity in Bullion district and quite a number of men are engaged in prospecting. The Lee mine is the principal mine in the district, and employs a considerable number of men in the mine and at the mill. There has been a change in the company's affairs, and the new superintendent is renovating the mill, giving out wood and timber contracts, and getting things in order for the summer's work. The ores are worked by the roasting process, and carry a very small percentage of lead. The deposit is quite extensive.

ELY DISTRICT.

Alps Company.—Pioche Record, March 10: The Alps company's mills are running regularly—the Pioche mill on custom ore and the Condon on concentrations. The Superintendent has been notified of a large shipment of Leads ore. Considerable ore is being extracted from the Alps mill on second level, and prospecting is being vigorously prosecuted.

Raymond & Ely.—The news this week in regard to the Raymond & Ely mine is very encouraging. On the 1100-ft level there are very good indications and in all probability the ledge will be struck in about a week. On the 8th level, also, there are good ore indications—a new development in the places worked. The 9th and 10th levels are being pushed ahead as usual.

EUREKA DISTRICT.

Shut Down.—Eureka Sentinel, March 16: Furnace No. 4, at the Eureka Consolidated works, was closed down yesterday, after a long and successful run.

Successor Mounier's Claims.—The following is a short description of a couple of mines on Prospect mountain, owned by Captain Foley. The Tyndall location shows very extensive surface indications, perhaps more than any other mine on that slope. The work done consists of sinking two shafts, one an incline 80 feet deep, the other a perpendicular shaft 60 feet deep, and 20 feet of tunnel running on the line of the ledge. Developments thus far have been sufficient to demonstrate the fact that this is a mine of some magnitude, the vein being about 90 feet in width, and contains chlorides of silver, sulphates of silver and some native silver. A considerable quantity of ore has been taken out, select samples of which assayed \$2,500 to the ton. The Cosmos, another location of 1,500 feet, is about 100 yards distant and parallel to the foregoing ledge, and shows much the same formation and arrangement as the Tyndall mine, selected samples from which assayed \$300 in gold and \$250 in silver.

CHERRY CREEK DISTRICT.

Encouraging.—White Pine News, March 17: From District Attorney Davis, just from Cherry Creek we get the following items: Dunn & Co. have purchased the judgment of Paul Mitchell and others against the Star mine, subject, of course, to release within the six months allowed by law to the former owners. The same parties have also purchased the Tehama mill at that place, and are interested in the mines of Hunter district—the latter, we understand, being about the very highest grade. But the indications in Hunter district are so promising as to warrant the purchasers in giving the high price demanded. The impression at Cherry Creek seems to be that the old owners of the Star will make such arrangements with Messrs. Dunn & Co. as will harmonize all interests, and that before long the mine will commence active operations. The Teasup and Pacific mines are being worked to good advantage, and the Tehama mill is being run to its full capacity. Another mill will be constructed in the spring, should the conflicting interests of the Star property be adjusted. The prospects of the camp are more encouraging than they have been for a long time.

WARD DISTRICT.

The Mines.—Eureka Sentinel, March 17: We have been permitted to extract the following from a letter received by a gentleman in this place. The writer says: The Step-toe Con. Co.'s mines are looking among the best of this district, and the company stands well in San Francisco. There are seven mines in the consolidation, of which the Ready Cash is the most developed, showing a vein of 25 feet of rich carbonate ore, paying well in silver, and promising to be one of the largest and best mines of the district. The Light, Cow, and the Emily produce high-grade milling ore, and are regular veins of good size. The company thinks its mines will constitute one of the great properties of Eastern Nevada. The Martin White Co. is taking out large quantities of rich ore, chiefly from their Paymaster and Defiance mines, and is producing about ten tons of bullion a day from two smelting furnaces. The mill has undertaken the experiment of the leaching process, instead of amalgamation, but the imperfect roasting of the ore, as effected in the White furnace, has prevented the success hoped for. With proper treatment, the mill running upon the rich ore of the Paymaster or other free milling ores of this district, would produce from \$3,000 to \$5,000 a day. Experiments are dangerous in a new country.

Arizona.

MINING MATTERS.—Arizona Citizen, March 10: The Drew-Symond's claim, on the Green lode, southwest of Tucson, is said to be opening up finely and even surpassing the expectations of the late purchasers. One blast this week blew down at least \$1,000 worth of ore. One of the claimants is reported as saying he wouldn't trade his mine now for the Silver King. It is undoubtedly a good mine. The Messrs. Hughes & Pacileo have a force at work on their discovery, 13 miles southwest of town, and the ore body opens finely as they go down. It will be remembered that the first assay from this claim went from \$408 to \$1,636 to the ton. The ore seems to maintain an even grade all the way, and the mine is, no doubt, valuable. Wm. Zeckendorf informs us that about 30 men are at work in and about the Yellow Jacket mine, that the ledge looks well and that richer ore than ever is coming out. The mill will be ready for crushing in a few weeks.

Colorado.

CASCADE DISTRICT.—Colorado Miner, March 17: Mr. Lincoln informs us that the Cascade mining company are pushing work rapidly on the Cascade mine. The tunnel is now in 433 feet, and the lode is improving with every foot gained. Parties are at work on adjacent lodes and with fair prospects.

RED ELEPHANT MOUNTAIN.—Since the great strike on the Free America, which has made a rich man of a poor prospector, attention has been attracted to this mountain and there are now engaged in prospecting upon it over 100 men. The boys are making dirt fly numerously, and although no big strikes have as yet rewarded their search, a number of lodes have been discovered and located.

SHERMAN MOUNTAIN.—The Cashier, owned by Messrs. Kalbaugh, McQuillan and Weisley, is now being worked by four parties of lessees, and is in good pay, in some parts of the mine the ore vein being quite large, and the mineral everywhere of good grade. The first-class ore runs from 600 to 700 ounces.

TERRELL MINE.—This mine is again to take its place among the leading mines of Clear Creek county as an ore producer, and we hope, with greater success than before. Mr. Henry has inaugurated active preparations to resume work, getting a new hoisting rig into the Terrell, and making every preparation for getting the water out of the mine on the double quick. A contract has been let to Messrs. Crawford and Storms to place a Burleigh engine in the tunnel, with much greater capacity than the one now doing duty there. A Knowles's special mining pump is to be applied to the water in the mine, and by Tuesday next the mine will be drained at the rate of 5,000 gallons per hour. As soon as it is drained, work will be actively commenced in the various levels. We understand, also, that the company's concentration works are to be placed in thorough working order, and all the company's works prepared for extensive operations.

Montana.

NEW MINES.—Helena Independent, March 8: The town of Pony, or Pony City, as it is sometimes called, is situated on the right hand fork of Willow creek, Madison county, two miles south of Hon. H. H. Mood's ranch. Buildings for various purposes are going up daily. It is the live town of the mountains. Forty or 50 dwellings have been completed, and more are going up. The lodes are being developed with a vigor seldom witnessed in a new camp. The Strawberry lode has been opened with the 60-ft shaft. The ore body is seven feet thick and pays from \$40 to \$50 per ton. It is owned by G. G. Marlon. Mr. Merks is now erecting a 15-stamp mill upon it, which he expects to have in good running order by the 1st of April. The Keystone lode, the property of J. W. Robinson, has an eight foot vein of ore that yields \$600 per ton. The Boss Tweed, owned and worked by Dr. Getchell & Co., is 24 feet in width, and pays from \$12 to \$15 per ton. Dr. has a five-stamp mill in operation, and is adding to it five stamps more. The Ned lode, owned by Mallory & Co., has a three foot vein of ore that pays from \$70 to \$140 per ton. The same company own the Willow Creek, a very promising lode that mills from \$25 to \$30 per ton, and contains five feet of pay ore. They also have in operation a 10-stamp mill. The White Pine lode shows a vein of solid ore two feet wide, that pays from \$30 to \$100 per ton. It is owned by H. H. Merks. A depth of 40 feet has been attained upon it. It is considered the best lode in the camp.

A RICH STRIKE.—Mr. R. McNeil informed us yesterday that Mr. Tatem had made a rich and important strike on the Park lode. For some time past work has been prosecuted in cutting through a fault in the vein some 20 feet in extent. When the lode was finally reached it was found fully four feet thick, and the whole body will mill \$50 per ton on an average. This strike will encourage others to persevere, and we confidently expect to see Park and Unionville thriving camps ere the close of the coming summer. What renders the above strike of more than ordinary significance is the fact that it was found at a much greater depth than has heretofore been attained on the lode, proving that it is a true vein.

PATENTS AND INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

- FOR WEEK ENDING MARCH 13TH, 1877.
- 188,255. EXTENSIBLE WAGON BODIES.—F. Oppenheim, S. F.
- 188,341. MILK COOLER.—H. Clifford, S. F.
- 188,345. GRAIN SEPARATOR.—W. Edris, Eugene City, Oregon.
- 188,348. DAM FOR STORING AND UTILIZING TIDE POWER.—W. E. Kelsey, S. F.
- 188,369. DREDGER.—W. B. Hyde, Oakland, Cal.
- 188,374. DEVICE FOR UNLOADING AND STACKING HAY, ETC.—G. F. Kelly, Susanville, Cal.
- 188,375. WINDOW-SASH HOLDER.—J. Kelly, S. F.
- 188,376. METAL WEDGE.—J. Kelly, S. F.
- 188,379. COMBINED HARROW AND CLOD-CRUSHER.—W. H. Kuhn and S. Miller, Albany, Oregon.
- 188,397. TOBACCO CUTTER.—Moon, S. F.

TRADE-MARK.

4,439. WATCHES.—J. Gordon, S. F.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco.

SILVER CROWN M. Co.—March 17th. Location: Arizona. Capital stock, \$10,000,000. Trustees—Isaac Weightman, A. W. Robinson, Thomas E. Hughes, Wm. S. Bell and Chas. W. Arnold.

ANADOR M. Co.—March 17th. Location: Arizona. Capital stock, \$10,000,000. Trustees—J. W. Gashwiler, B. B. Minor, J. W. Young, H. W. Burling and E. de Prati.

CARLEO BAY COAL M. Co.—March 17th. Location: California. Capital stock, \$10,000,000. Trustees—Joshua Gray, Wm. Steider, Horace Jameson, Andrew Kohler and Lorenzo B. Lyman.

CROOSE a good companion only—one of Dewey & Jordan's "New York watches."

Hydraulic Mining.

The San Francisco *Alta* has been and is still a staunch friend of the hydraulic miners of the State, and has ably defended the interest against the efforts of the agricultural portions of the State to destroy or cripple it. But in a late issue it makes some assertions that are not borne out by facts. It affirms that most of the hydraulic camps are exhausted, and in tracing the line of exhausted claims, it mentions several places in this county that it thinks are played out. San Juan and Moore's Flat are among the number. It says further that "the assertion that hydraulic mining is in its infancy, indicates ignorance of the history and condition of the business. Of course," it says, "the owners of hydraulic claims, anxious to sell them, will say that they own miles upon miles of deep and rich gravel, but let the buyer beware how he believes." Now, if the mining expert of the *Alta* will take the trouble to visit what he calls the exhausted hydraulic mining section of Nevada county, it will find that it has shown in its assertions an entire ignorance of the condition of the business. It is true that some mining camps in this county have decayed, but the cause is not due to the exhaustion of all their mining claims. Some of them had rich surface mines, which have been worked out, but the surface gravel was only the outwash from old channels which still lie hidden away under the hills adjoining, and which contain millions of treasure where only dollars were found on the outshoots or surface claims sent out by them. These deep claims require time and capital to open and work them, but that they exist and can be traced for miles is beyond dispute. Wherever they have been systematically opened, they never fail to reward the operators. That they have for long years been allowed to remain undisturbed is true. Men of means have been pleased to invest their capital in the mining stock market, where the fluctuations gave them a hope of reaping sudden accumulations to their hoards, rather than to engage in legitimate mining enterprises. But this is not the fault of the gravel belts. Instead of Moore's Flat being an exhausted camp, it is to-day in the immediate vicinity of the richest and most extensive mining region of the coast. And the same may be said of all the towns on the ridge, including San Juan.

That "miles upon miles of deep and rich gravel" exist in that section of our county is past dispute, and is admitted by every mining expert in San Francisco who has ever visited that section, as the *Alta* will discover if it will refer to their reports upon the subject. It will also learn, by visiting the county that these "miles of gravel" are being opened all along the line. Moore's Flat was once famous for its mineral wealth, when less than a mile on a side channel was worked; what will it be when several miles of the main channel is in full operation, as it soon will be. It is probable that the amount of debris sent from the mines will not be increased as the *Alta* in its article seems to want to convey the impression, for it is now generally conceded that hydraulic mining will, in the near future, be abandoned for the more profitable method of drift mining. Men have learned that it is cheaper to take out the richest portion at the bottom of the channel than to wash it away by hydraulic power, when two or three hundred feet of banks containing but little pay dirt have to be sent away with it. Instead of our gold bearing gravel being exhausted, it has barely been touched, and mining writers at the Bay will convince themselves of the fact by visiting this county and witnessing the new enterprises being inaugurated and in operation to open up the country.—*Nevada Transcript*.

LANGLEY'S DIRECTORY.—Langley's San Francisco Directory for 1877 has been issued from the press. This is the 20th year of publication and it is really a standard work. It contains a great mass of information aside from the Directory proper, all of which has been compiled with intelligent care and conveniently arranged. A thorough publication of this character is of importance to the city. In our journeying in Eastern cities we saw none equal it. The publisher is experienced and careful, and his work circulates more in proportion to those of other cities, showing the work is appreciated. The go-aheadiveness of our city makes frequent changes necessary and also makes a Directory almost indispensable. The Directory for 1877 contains a lithographic map of the city, with colors indicating the different sub-divisions of the city and county, with streets, wharves, reservations, etc.

THE big ship, *Three Brothers*, departed last Saturday on her fourth voyage around "the Horn." She carries the largest and costliest cargo ever taken by any sailing ship from California, its value amounting to \$240,000. Captain Cummings, her commander, confidently expects to make this trip to Liverpool within 100 days. It took the two powerful tugs, *Monarch* and *Neptune*, to tow her out of the harbor.

DON'T trifle with a poor watch when you can buy a good one of Dewey & Jordan, 433 Montgomery street, San Francisco, at prices according to the times.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

FITZGERALD'S *Home Newspaper and Educational Journal* is the title of a new San Francisco weekly issued by Rev. O. P. Fitzgerald.

General News Items.

THE spring meeting of the California Rifle Association will take place at San Bruno, San Mateo county, on Wednesday April 11th.

REAR-ADMIRAL SIR EDWARD BELCHER, the explorer who commanded the expedition in search of Sir John Franklin in 1852, died in London last week, aged 78.

FOUR clerks of the U. S. Treasury left for Europe on the 18th, carrying with them \$10,000,000, of the 4½ per cent. United States bonds for the Syndicate.

THE English steamship, *Spartan*, left New York on the 18th for Java, freighted with 394,000 gallons of refined petroleum. She goes via the Suez canal. The object is to head off the arrival in Java of 250,000 gallons of oil, shipped in sailing vessels in last January and February. This is the first ocean steamer carrying petroleum.

SECRETARY SCHURZ appointed as the Committee to investigate the grasshopper plague, under the act of Congress, Professor Riley, State Entomologist of Missouri; Professor Thomas, of Illinois, and Doctor Packard, of Salem. These gentlemen will leave Washington soon for the scene of their labors.

A PRIVATE Toronto dispatch announces a decision of the Court of Appeals in that city, of interest in the business community. In the case of McLean vs. Dun & Co.'s Mercantile Agency, the judge decided that the defendants could not be held liable for losses incurred through their reports. The amount involved was small, but the principle involved made it a test case.

IMPORTANT orders will be issued by the Interior Department shortly for the protection of timber on the public domain from depredation. The present system of entrusting its care and the detection of depredators to the local officers will be abolished, and the Department will send out specially qualified agents to detect and report to the Department of Justice, for prompt punishment, all persons cutting timber on public land without the authority of the Government.

GENERAL SHERIDAN has the arrangements completed for the erection of two new military posts in the Indian country as soon as the materials can be transported up the Yellowstone. One is to be located at the mouth of the Tongue river, the other near the mouth of the Little Big Horn river. Each post will contain quarters for 12 companies, and these will be garrisoned by six companies of cavalry and the same number of infantry. General Sheridan is of the opinion that if there had been posts in that country a year ago the Custer massacre would not have occurred.

THE BLACK HILLS MINERS.—A correspondent of the Omaha *Herald*, writing from Deadwood says the people inhabiting the Black hills, realizing the fact that the Government is not, at least for the present time going to afford protection to their lives and property, and they being fully aware of the danger that threatens them on the opening of spring from hostile Indians, have determined to act on their own responsibility in the matter. Meetings were held at Spearfish and Crook City, at which the subject of self-protection was fully discussed, and delegates were appointed from both of these localities to meet the citizens of Deadwood in mass meeting, to discuss the best mode of accomplishing the desired result. The mass meeting was very largely attended and proved to be a success. Several gentlemen of prominence expressed their views on the subject, all agreeing that some immediate action should be taken by the people. It is proposed to arm and equip a band of 20 scouts under the leadership of Tom Hardwick, an experienced Indian fighter, to take the field immediately and discover the whereabouts of the camp of Indians who have already commenced their work of murdering and stealing. It is further proposed to organize and equip a home-guard company of 75 men who are to be held in readiness to march against the hostiles, if the scouts succeed in finding them.

Look out for a man calling himself J. Livingston. Last whereabouts in Yuba county.

DEWEY & JORDAN have been at 433 Montgomery street, S. F., for 13 years. They are reliable—like the "New York watches" they sell.

THE GRAND PACIFIC HOTEL, Chicago, with its central position and railroads branching off in every direction, is naturally a point to which travellers from all parts of the country are apt to come more or less frequently. Being there, a hotel is a necessity. A first-class one in every respect will be found in the "Grand Pacific," which is the temporary home for our off-hand Western folks who want to go to the best place the first time. The hotel is a handsome one and is fitted up in fine style with all the modern conveniences. It is centrally located, keeps a first-class table with the best market affords at all times and seasons, and the proprietors know how to make their guests feel at home.

"TESTING ORES."—A. B. Roberts, of Boise City, says: am very much pleased with Chas. H. Aaron's work on "Testing and Working of Silver Ores." It will be the cause of new life and great advancement in silver ore prospecting if miners and prospectors would procure a copy and put in their pockets when they start for the mountains.

"SPEAKS WELL," ETC.—We would return thanks for an exchange and back numbers of the MINING AND SCIENTIFIC PRESS, published by Dewey & Co., of San Francisco, Cal. It is a well edited, interesting, and valuable journal and speaks well for our Pacific neighbors.—U. S. Mining and Manufacturing Journal.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the heading of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the heading of "Leases" are the titles, Smelting, Mexican process, Chilean process, Krochne's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome Street, San Francisco.

Thanks for Prompt Attention.

STOCKTON, June 26th, 1876.

Messrs Dewey & Co., S. F.:—
I have received the patent for my invention in wagon brakes, which you prosecuted for me; patented May 11th, 1875—No. 163,046. Thanks to you for your prompt attention to the case; you will remember be my attorneys in such cases. I recommend all inventors on the Pacific coast to give you a call, which I think they will never have any cause to regret. Very truly yours,
GEO. G. BUCKLAND,
Stockton, Cal.

NEW YORK WATCH CO'S FIRST CLASS AMERICAN WATCHES, FROM SPRINGFIELD, MASS.

Mining and Scientific Press.

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.
As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.
Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.
Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents. As an

ADVERTISING

Medium for the Pacific Coast, it is superior to any other journal for all kinds of mining and hydraulic machinery and other mechanical work, building materials, new manufactures and inventions. Our rates are very reasonable compared with those of other first-class journals.

DEWEY & CO., Publishers.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

Dolores Consolidated Mining Company

Location of principal place of business, San Francisco, Cal. Location of works, Dolores Mining District, Esmeralda County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of February, A. D. 1877, an assessment, No. 1, of 10 cents per share, was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 418 California street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 26th day of March, A. D. 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 16th day of April, A. D. 1877, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Secretary.

Office, Room No. 2, 418 California street, San Francisco, California.

Excelsior Silver Mining Company, Nye

County, Nevada. A meeting of the stockholders of the above company will be held on the 28th day of March, 1877, at the office of the company, 306 Post street, San Francisco, California, to elect Trustees.

W. A. KOLLMYER, Secretary.

Klamath Quartz Mining Company—

Notice is hereby given that the principal place of business of this company will be removed to Klamath Mill, Siskiyou County, California, from the City and County of San Francisco, California, in thirty days from the date of the first publication of this notice.

GEORGE H. FOREE, Secretary.

San Francisco, March 21, 1877.

Mariposa Land and Mining Company

of California. Location of principal place of business San Francisco, California. Location of works, Mariposa county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 9), levied on the 16th day of January, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

PALMER, KNOX & CO.,

Nos. 19 to 25 FIRST STREET, San Francisco, Cal.

THE ASBESTOS PATENT FIBER COMPANY,

TWO MEDALS OF HONOR.

TWO CERTIFICATES OF THE HIGHEST MERIT.

Of Philadelphia, offer for sale through their agent in San Francisco,

Asbestos Steam Packing, Asbestos Boards and Asbestos Steam Joints,

All manufactured from the pure utilized Asbestos Patent Fiber, and under patents granted to J. S. Rosenthal. The packing is in all sizes from one-quarter to three inches in diameter, round, and free from all grit or mineral matter. The non-utilized or crude Asbestos, manufactured by some parties into packing, is impure and gritty, liable to injure the piston rod and should not be used. The packing made under the Rosenthal patent heretofore offered for sale. It is compact in form, will not fuzz or disintegrate, and will wear much longer than any other kind of packing. The indestructible, expanding, contracting and lubricating qualities of Asbestos are now universally recognized, and packing made from it is peculiarly adapted for steam engines and pumps.

ASBESTOS PATENT FIBER BOARD.

This is the champion non-conductor, to prevent radiation of heat and condensation of steam, as covering for marine, stationary, or locomotive boilers and pipes, and for lining wood-work, where exposed to great heat. It is light, flexible, is not disturbed by vibration, and will not char or crumble. The sheets are 30 by 44 inches, of any desired thickness, and are easily applied.

ASBESTOS PATENT FIBER STEAM JOINTS.

Indestructible by fire or water, expands and contracts in a desirable manner, adjusts itself to any rough point, is cheaper than rubber, and in all respects a superior article. PURE ASBESTOS FIBER for packing steam governors and other purposes. All these goods are extensively used in the Atlantic States and give general satisfaction.

Also, For Sale by

A CARD.

Pacific Iron Works, First and Fremont Sts., bet. Mission and Howard, San Francisco,
Rankin, Brayton & Co.,

Manufacturers of Engines, Boilers, Marine and Stationary. Pumping, Hoisting and Mining Machinery, including Batteries, Amalgamating Pans and Settlers, Concentrators, Ore Feeders, Crushing Rolls and Rock Breakers. Also, Water Jacket Smelting Furnaces for reducing Lead, Silver and Copper Ores, Quicksilver Furnaces, Retorts and Condensers, Roasting and Chloridizing Furnaces, Sugar Mill Machinery, Water Wheels, etc., all of the latest and most improved construction. Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster Rock Drills and Air Compressors, Wheeler's Ore Breaker, etc., etc.

GEO. W. FOGG, Supt.

ERICH G. GAERTNER,
MINING ENGINEER.

All classes of mining properties reported on, consultations had on reduction of ores of all descriptions, plans for furnaces and reduction works furnished, and the construction of them superintended. Ore tests made at the office.

CAST STEEL SHOES
AND DIES.

Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents
to 12 Cents Per Pound.

Owing to our largely increased business, the present
low price of Iron from which our Steel is manufactured,
and the improved facilities for casting and forging,
we take great pleasure in announcing that from and
after this date we will supply our IMPROVED CAST
AND FORGED STEEL SHOES AND DIES FOR
QUARTZ MILLS at twelve cents per pound, delivered
at San Francisco or Sacramento, instead of sixteen
cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore
Crushers, Steel Gut Gearing, etc., for Mills and Hoisting
Works, Steel Fan Shoes, Battery Cams and Tappets,
etc., etc.

Address all orders, with dimensions or drawings, to

PICKERING ENGINE GOVERNOR.

VALLEJO FOUNDRY, October 17th, 1876.

Messrs. NEYLAN & YOUNG, San Francisco,
Agents for "PICKERING GOVERNORS."

Gents:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this
year for my patent Straw Burning Threshing Engines give splendid satisfaction. They
far surpass for regularity of speed any Governor that I have ever seen, and I have
seen all the best kinds; I have seen the main belt fly off the pulley several times this season
while threshing, and the engineer did not discover it, so perfectly was the speed main-
tained, until he was told of it; this I consider something wonderful; I consider the Gov-
ernor absolutely perfect, so far as speed is concerned. I bought and put on to one of
my engines a Shive Governor, to see which was the best, and after one season's trial I
have no hesitation in saying they are far superior to any other Governor that I have seen or
used. I wish you would send me the lowest price that you can furnish 25 Governors for
your season's engines. Yours respectfully,
J. L. HEALD.

The only Governor that has received awards at each of the International Exhibitions.

Band Saw Re-Sawing Machines.

The illustrations shown on this page represent a new band saw re-sawing machine, built by Richards, London & Kelley, the well-known band saw machine manufacturers. The cuts show two views (two elevations) of the machine and give a pretty good idea of its mechanism.

The frame is cast in one piece, with a rectangular cored section. The wheels are 60 inches in diameter, of wrought iron, covered with wood, and faced with leather or gum, warranted to stand the tension of blades to three inches wide, and safe from centrifugal strain. The top wheel has a vertical adjustment of 16 inches, and is carried on a steel shaft 2½ inches diameter, with bearings on both sides of the wheels. The supports rest on

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective superintendents on file at the offices in this city.

The ore breasts in the California are looking well and yielding the usual quantity of good ore.

The ledge matter of the Coso Consolidated averages two feet in width. The vein in the Gila mine shows marked improvement in the past few days, both in ore and the quality of the vein matter. It is not carrying any more ore, but in every other way looks more encouraging than it has for some time past.

At the Cosmopolitan they are sinking a winze on the ore body discovered in the main tunnel. The rich rock in the Mansfield still holds out. That which is now coming out is very rich.

The Eureka Consolidated ore, now being reduced, assays about \$40 and from 18% to 20% lead.

The rich ore in the vein in the lower level of the Panther is somewhat bunchy.

The Electric ore yields \$7 per ton.

The Eureka (G. V.) last clean-up was 285 ounces of amalgam.

Work on the 1700-foot level of the Gould & Curry has been stopped to put in new pump rods.

The Superintendent of Justice says: The ore producing stopes above 400-ft level are improving so well in making northward, we are about commencing a new ore and timber shute 90 feet north of our present north ore shute for the purpose of facilitating the working of this important ore body existing above this level. Thousand-foot level ore development, the drift

The Mining Interests of Idaho.

The quartz mining interests of Idaho have for a long time been under a cloud, and the difficulty of overcoming the popular prejudice against Idaho mines has worked great hardships to the miners. It is but just to remember, however, that this feeling has been caused more by the action of the managers of the mines than by reason of any lack of confidence in the mines themselves. The stocks of those mines which have been listed in the boards in this city, have been made shuttlecocks of and thrown about to suit the whims and schemes of the managers. The practice became so outrageously bad that the public here came at last to look upon Idaho stocks as so many assessment

thought more of stock operations than of legitimate mining.

The placer mining interests of the Territory, which are much larger than most people suppose, although not so important as in former years, are looking up. The winter has been so dry that the miners have been despondent and the outlook has not been very flattering. Of late, however, prospects are much better for a good season. A correspondent of ours, writing from Boise City under date of the 19th inst., says that the heavy rains of the two weeks from the 3d of March have resulted in furnishing a good supply of water on the ground and will secure a good crop in the valleys; while in the mountains there has been a heavy fall of snow, and now the miners think they will have an average if not a long mining season. Mining has been progressing in the Boise basin for for some ten days with a full force, thus getting

RICHARDS, LONDON & KELLEY'S BAND SAW RE-SAWING MACHINE.

springs that equalize the tension on the blades, and allow them to expand or contract. The machine receives saws to 32 feet in length and three inches in width, and is calculated to cut lumber ten inches thick and 24 inches wide. Messrs. Burnham, Standeford & Co., of Oakland, recently put one of these machines into their mill. This machine has re-sawed 10,000 feet of lumber in a day of ten hours run. Berry & Place of this city are the manufacturers, agents, and will give any further information to those desiring it.

WHAT water the miners on the divide have this season, says the Placer Herald, is being used to good advantage. The drift claims in that region were never looking better than at present, and the discount in the yield of the hydraulic mines, in consequence of the limited supply of water, will be largely made up by the increased yield of the drift mines.

A MEETING of oilmen was held at Lyons station, Los Angeles county, on Saturday, in reference to the taking up of mineral lands by squatters. Notification was sent to the latter to vacate the same immediately or summary steps would be taken to eject them.

following the same south continues to expose a very promising vein, plainly indicating a bright future.

The water in the C. & C. shaft is coming in very strong.

Average assay of Chollar ore is \$25 to the ton.

Work at the various prospecting points of the Raymond & Ely mine is progressing satisfactorily without any marked change. The 30-stamp mill will start up on tailings in a few days.

The Barcelona tunnel is now in 813 feet.

In the Manhattan the 500-foot west drift continues in very hard rock, with no ore. The stope above still carries very good ore near the 434-foot level. The upper stopes on the 370 and 300-foot levels are producing a limited quantity of ore. The 560-foot east drift carries a small ledge of fine ore.

THERE is quite an excitement in Salt Lake City over the discovery of a silver-bearing mining ledge in Red Butte canyon, about three miles from the city. It is claimed to assay over 300 ounces of silver to the ton, and there is quite a stampede from that town to the vicinity of the discovery.

machines, and nobody would have anything to do with them. When these stocks became comparatively worthless from the effects of these actions of the managers, and the people refused to pay any more assessments, the trustees shut down the mines and let them lie idle; they found it less expensive to make money out of assessments than working the mines legitimately.

This action was of course very detrimental to the mining interests of the Territory at large but more particularly so to the towns and the miners at the mines. When several prominent mines in a camp shut down or fail to pay wages owed, and are temporarily abandoned, it must naturally depress all kinds of business in the vicinity. This state of thing lasted some time, and there was some difficulty with the miners on account of non-payment of wages; but now several of the mines have been started up again and under changes of management better things are hoped for this year. There is little doubt that if the Owyhee mines were situated somewhere else they would command much better figures and would be worked more vigorously; and this simply on account of the reputation they have unfortunately acquired through the machinations of persons who

about six weeks' earlier start than usual. Now the outlook for Idaho is good for the coming season. This shows how a few days' rain will change the prospects of an entire country and shows also that it is not California alone that is affected by dry seasons.

MINE PATENTS.—The patents for the Cerro Bonito quicksilver mine has been sent from Washington. Their issuance has been delayed several years by McGarrah's patent, claiming that these mines were within the inferior boundaries of the Panoche Grande ranch. Ex-Senator Stewart and William Neely Thompson are daily working at the Interior Department to secure the issuance of a patent to the New Idria company for the quicksilver mines now in their possession. Their efforts are combated by McGarrah and his attorneys, who insist that no patent should be issued for this property until the question of rightful ownership shall be again submitted to the courts and finally adjudicated, by means of a Government suit against the present occupants, with the right for McGarrah to interplead, as proposed by a resolution which some years ago passed the House of Representatives by nearly a unanimous vote.

CORRESPONDENCE.

Mining in Beaver County, Utah.

EDITORS PRESS:—After leaving the terminus of the Utah S. R. R. at York, a ride of 140 miles by stage (the Gilmer & Salisbury line) brought us to Beaver City, which is from 20 to 50 miles of Bradshaw, Star and San Francisco districts, the principal fields of the most active mining operations.

Good ore and promising veins have been found also in Lincoln, Rocky, Beaver Lake, Preuss and Granite mining districts, many of which will be favorably heard from when better facilities are provided for reduction and shipment of ores.

Limestone may be set down as the characteristic country rock, but not unfrequently found in near contact with porphyry, syenite, granite, hornblende or some kindred formation, which in some instances are known to form one or both walls of the lodes. The general character of the ore is plumbiferous and ferruginous, carrying fair values in silver, so that furnaces are more in demand than mills, although instances are not wanting where a comparatively free milling fluor spar, or some similar gangue, running high in silver, has been found lying side by side in the same mine, with the ever present carbonate of lead.

The Cave Mine.

Situated seven miles from Minersville, in Bradshaw district, has been opened by a tunnel 320 feet in length, attaining a depth from surface of 200 feet. The ore body for 80 feet in depth below the cave entrance is averaged at 100 feet in length by 80 feet in width, varying at other points from two and a half to six feet, the full width of the lode from wall to wall not yet ascertained, although good ore has been found thus far in all the levels opened.

The matrix in this case is a decomposed quartz, easily mined and milled, averaging \$50 in gold and silver. Some of it is of very high grade, giving assays of \$3,000 per ton; one lot of 10 tons working up to \$402 per ton. Prospecting is now going on at the 200-foot level, where a streak of carbonate ore has been struck, estimated to run \$160 in gold and silver and 30% in lead. This is one of the leading mines of the district and looked upon generally as a very valuable property. In the same vicinity, the Promontory may be mentioned among the promising claims, having furnished some ore running as high as 60 ounces in silver and upwards of 60% in lead. Good accounts were had of the Chancy, the Emeline, the Mountain Maid, and others, some ore from the last named represented to have run as high as \$200.

Mines of Star District.

The Burning Moscow, owned by Messrs. Taylor, Golden & Co., one mile east of Shauntie, appears to be a contact vein, lying between the white and black limestone. The lode has a beautiful, smooth foot-wall, and is about four and one-half feet in width, with average ore vein of 15 inches of carbonate and oxide of lead, which is paying a profit of about \$25 per ton. There are also in connection with the mine five side veins putting into the main lode from the west, where they are cut off by the hard magnesian limestone on the east wall. All these feeders, which are from 18 inches to two feet thick, are producing ore of a similar but richer character than that of the mother lode, some first-class working up to 150 ounces in silver and to 60% in lead.

The Boston, a few hundred yards from the above, shows at the foot of shaft and in two drifts from same a fair body of smelting ore, running from 40 to 50 ounces silver and 50% lead. The tunnel already advanced over 300 feet, is expected soon to tap the vein. It is straight as an arrow, and for neatness and finish could not be better.

The Sarsfield, just above the Boston, yields some high grade ore, the lead running 60% and first-class as high as 80 ounces in silver.

The Wasco

(Elderman, Kimple & Co.), two miles from Shauntie, near the Picacho peak, was first opened by incline on vein of 270 feet, and afterwards tapped by tunnel 170 feet. The ore is from three to six feet in thickness. The whole is extracted and smelted, giving a general average of 60% lead and 72 oz. silver. It has paid \$20 per day to the man from surface down, most of the ore coming from the incline. In addition to considerable bodies in sight the lower works were giving indications of a near approach to some rich chimneys, previously cut by the incline.

Immediately below the Wasco the Mountaineer exhibits a large body of iron, ochre and carbonate ore, some of which has been shipped, bringing from 20 oz. to 60 oz. silver, and from 30% to 40% lead. The Harrisburg belonging to Messrs. Sloan & Kimple, has an incline 200 feet, on a vein of carbonate ore, represented to look well at the bottom. One hundred and fifty tons have been shipped, first-class, \$180 silver and 60% lead.

The St. Marys, south of the Wasco, owned

by Messrs. Barrett, Taylor & Shumer, has had a considerable amount of good ore extracted and is looked upon as a promising prospect.

The Mammoth

(Walker & Co.), is admirably located for convenient working by tunnel levels, on the crest of the mountain near the center of the district, north and south. The greatest depth attained by shaft is 342 feet, where the ore vein is eight feet; character, argentiferous galena, averaging 52 oz. silver and 55% lead; first-class going as high as 111 oz. silver and 72% lead.

Owing to the difficulty of hoisting the ore by windlass, a tunnel is about being run to tap the lode at the foot of the shaft. Any desired number of levels can be extended along the vein in the same direction, beginning at different points on the side of the mountain where the lode can be seen boldly cropping out.

This may well be viewed as one of the leading mines of the district, surface indications in connection with present developments, giving promise of leading to much larger and better defined bodies of ore, than any yet encountered. It has paid from its opening in 1875; and while the owners have been far from realizing the full amount, the gross value of ore yielded during that time has been put down in the neighborhood of \$100,000. The Elephant, lying north of the Mammoth, has two shafts, the deepest 150 feet; ore often found in large bodies in pockets and chambers. Over \$10,000 worth was purchased at one time by Shumer & Co., the product of a single month. For reasons not learned but little was done last year, but arrangements are now being made for a vigorous prosecution of the work.

The Croesus.

In North Star, the property of Mr. H. M. Donaldson, has a shaft down 70 feet, and a 40-foot drift. It is understood to be a late discovery of very great promise, the ore consisting mostly of chloride and black sulphurets of silver, giving assays as high as 6,000 oz. and upwards, and 64% lead. A small lot worked 1,500 oz. in silver, and the owner is sanguine enough to think the ore will average something near this amount, besides running from 50% to 60% in lead. If so he may consider himself already "as rich as Croesus," and prepare at once "to retire to private life."

The Vicksburg.

Owned by Shumer, Donaldson & Cook, is a true fissure vein in the granite, some eight feet wide, with ore from two to five feet; the ores, galena, carbonate and iron intermingled with some bunches of pure sulphur, running from 60 oz. to 70 oz. silver, for first-class, and 70% lead, and second-class 40% to 50% lead. The mine has more than paid its way, leaving at present a good body of ore in sight, extent not known, that is growing larger and richer as depth is attained.

The Hoosier Boy.

Owned and worked by Shumer & Co., and by Mr. John Andrew, who holds a fourth interest. One shaft 240 feet, besides three others, all connected by levels on the vein. In addition to the carbonate ore, a sufficient amount of iron is found to render it valuable for smelting.

About 2,000 tons have been extracted within the past three years, mostly from the surface to the depth of 100 feet and slope of 300 feet in length. Since June last, the ore has averaged 50 ounces silver, and something upwards of 45% lead.

Not including some dead work in the way of developments, \$12,000 worth of ore was taken out from August 1st to December 1st, 1876, at a cost not exceeding \$1,500. So that this also may be classed among the good paying mines of the district. Before passing to a new field, it may be well to mention in this connection, that Shumer & Co. have a neat furnace at Shauntie, of one stack, large size, with a superior condensing chamber for saving the dust. Its capacity is 20 tons per day, is doing a fine business and a necessity to the camp not to be dispensed with.

Copper Mines, Beaver Lake District.

It is understood that six claims are at present being worked, the ore running from 20% to 30% copper, 20 ounces silver and one ounce in gold. Forty tons, selected and sold, went 30% copper, 40 ounces silver and one and a half ounces in gold. One claim is represented to have 100 tons on dump, and considerable activity was being displayed, in consequence a contemplated erection of concentrating works.

Some of the Mines of San Francisco District.

Two very promising claims, the property of Messrs. Adams & Stokes, are located in what appears to be a species of horn-blende, and have both paid a profit. The Cerro Gordo has shipped \$5,000 worth of ore, which usually runs from 55 to 100 ounces in silver, first-class going from 265 to 300 ounces—a chloride and milling ore. It has been laid open at several points on the side of the mountain by cuts, showing ledge matter 30 feet in width, but as yet no well defined lode. The Minnesota is in all respects similar. Favorable results may be looked for when the vein is reached at a depth of 100 feet from surface by a tunnel which they are now driving.

The Mountain Maid, (Mulcoy & Ritchie), was opened two years ago by a shaft 50 feet, some ore shipped at that time, brought 130 ounces silver and 68% lead, 12 sacks selected ore as much as 500 ounces. An incline is now being run on vein, which shows two feet of fine looking ore.

These mines, together with the Portage,

Monahan, Snort, Gray Eagle, the Drum & Mahoney, and others of more or less promise are situated on the opposite side a high ridge and two miles from

The Great Bonanza

Of the county, which towers so far above every other mine in this and surrounding districts, as to cast a shadow over what might otherwise have been stars of no small magnitude. The Mono, the Ira, the Crismon, Mammoth and other mines of Utah have richer ores, the Comstock and Richmond of Nevada may have larger chambers, but in some respects, more particularly in the great uninterrupted, evenly paying, compact character of its immense, and as yet unknown ore body, it will, unhesitatingly, bear favorable comparison with the best mines of the continent, for so far as developed, neither break, nor fault, nor horse of country rock, with scarce a vestige of waste gangue has made its appearance to mar the beauty, symmetry and uniformity of the great ore deposit.

It is situated at Grampion and is known as

The Horn Silver.

The property of Messrs. Campbell, Byrom, Ryan and Cullen, the first mentioned having the management of the furnace, while the last has charge of the mine.

It has been opened by shafts to the depth of 150 feet. A level of 300 feet in length has been run at the depth of 100 feet from the surface, and another of 100 feet and upwards at the depth of 150 feet. A cross drift from the upper level, running easterly 40 feet, struck the porphyry, the first and only indication of a wall yet found, the shafts, levels and drifts having all passed through a solid and continuous mass of ore. A cross drift from the lower level has been extended 70 feet on the east side without reaching the wall. It is positively ascertained from the developments, that the ore body is 300 feet in length, over 40 feet in width and 150 feet in depth, with a solid mass of ore at the bottom, throughout, at each end and everywhere except at the single point in the 100-foot level where the porphyry was found. So that it is impossible to form, as yet, anything but a very imperfect conception of its length, breadth and depth. The ore so far extracted and worked (no waste), has averaged 33 ounces silver and 50% lead, the last 500 tons going as high as 35 ounces silver and from 45% to 50% lead. In addition to the smelting ore there is a considerable body of milling ore in portions of the mine with quartz and spar as the matrix, frequently rich in horn silver, and rated at \$250 per ton. Work was commenced about a year ago, since which 2,600 tons have been extracted, worth at Salt Lake City, \$48 per ton, giving a yield of nearly \$125,000. Taking the figures and the measurements as above given, as a basis of calculation, it leaves us with \$10,000,000 in sight, with not less than \$4,000,000 thrown in which can be set to account of mining, smelting and incidentals. The ores are reduced principally at the furnace of Ryan & Co., at Frisco, one mile from the mine and some of them probably at the furnaces at Shauntie and Milford. The extensions, as a matter of course, are all taken up, but as they had not been developed to any great extent, none of them were visited.

The Young America.

About 1,000 feet south of the Horn Silver, owned by Messrs. Jones, Ritchie and Enaberry, has a shaft 60 feet deep, following the ore all the way. This vein is small, but said to be widening. Ore assays, 26 ounces silver and 79% lead. A tunnel has been run with the view of tapping the lode. It has been extended 130 feet and has about 80 more to run.

The Grampion.

Belonging to Messrs. Ryan & Hawkes, and, I believe, the original owners and discoverers of the bonanza, lies several hundred feet southwest of the same. They have a shaft 140 feet and four feet of carbonate ore, running 50% in lead and 30 ounces in silver.

From this brief and imperfect sketch of the mining operations of the county, it must be evident that she contains within her boundaries vast resources in the way of mineral wealth. As soon as the railroad reaches her borders, a new impulse will be given, capital will flow in, mills, furnaces and all the necessary facilities for extracting and reducing the ores will be supplied, and her bullion product (it is safe to say), increased a hundred-fold. Yours, A. C. K.

Globe District, Arizona.

EDITORS PRESS:—The furnace of Messrs. Bebee & Kenedy started up March 6th. The furnace is modeled after the English copper furnace. The works cover about a quarter of an acre of ground and are very substantially built. The Superintendent is Mr. E. O. Kenedy. Mr. Jennings is running his Mexican smelter on ore from the Richmond basin; from all accounts he is working very successfully. Tidwell's mill from Silver City, Nevada, arrived in McMillan's camp about two weeks ago. It is a five-stamp mill. Mr. Tidwell, the Superintendent, is busily engaged erecting the mill. He expects to blow the whistle and start the stamps in about three weeks. Messrs. Stockman & Currier are erecting amalgamating works at the Wheatfields. They intend to grind in arastras and amalgamate in barrels. Their works will have a capacity of one ton per day.

They have got over 150 miner's inches of water to run their wheel.

McMillan's Camp.

McMillan's camp is situated in Globe district, about 20 miles from Globe City. There is plenty of wood and water there. The mines are situated in low, undulating hills, which are of a granite formation. The principal veins run northeast by southwest intersected by many counters and cross courses which are very small, but yield very rich ore.

The Evening Star mine, shaft 25 feet deep, three feet of vein matter, width of vein unknown. Average assays of ore body in sight 150 ounces per ton, owned by James Aikens. The Hannibal mine on same ledge. Open cut on ledge. Vein 60 feet wide. Pay streak six feet. Average assays 100 ounces per ton. Owned by Yager & Co.

The Stonewall Jackson mine on the same ledge has a tunnel on vein 30 feet in. Expects to cut ledge at 40 feet. Small stringers of rich ore to be seen in face of tunnel. Shaft down on ledge 34 feet. Width of shaft in ore. Width of body unknown. Average assays run from 40 to 60 ounces per ton. Owned by McMillan, Harris & Co.

The Little Mac mine ledge is a counter from main ledge. Open cut on vein 20 feet deep. Vein 18 inches wide. Assays \$2,000 per ton. Owned by McMillan, Harris & Co. The Democrat mine is an extension of the Little Mac. Shaft 12 feet deep. Vein 18 inches wide. Assays 200 ounces per ton. Owned by McMillan, Harris & Co. The Florence vein is a counter from the main ledge. Shaft 35 feet deep. Vein 18 inches wide. Assays 100 ounces per ton. Owned by Charles Williamson. The "440" mine is on the same ledge. Tunnel cuts the ledge 60 feet deep. Vein 13 inches wide. Assays 50 ounces per ton. Owned by Palmer & Williamson.

The Awalden mine has a shaft on ledge 25 feet deep. Vein four feet wide. Average assays 160 ounces per ton. Owned by Yager, Richard & Co.

Pride of the West has a shaft on ledge 13 feet deep. Vein two feet wide. Average assays 120 ounces per ton. Owned by Yager, Richard & Co.

Two small feeders which are stringers or feeders to the American ledge on the Stonewall Jackson mine, contain very rich ore. Width of Feeder No. 1 eight inches. Average assays, \$2,500 per ton. Width of Feeder No. 2, six inches. Average assays, \$4,000 per ton.

The Ores of Globe District.

The ores of Globe district may be divided into four classes. First, free milling ores—ores containing chloride, bromide, and iodide of silver, and surface or desulphurized ores, which yield their silver by raw amalgamation very well; second, from ores containing silver which do not work well by raw amalgamation; third, cupiferous ores—ores containing sulphur, carbonic acid, silicium, arsenic, consisting of gray copper ore; tennantite and bournonite which require to be roasted to be treated successfully; fourth, ores containing lead—as a carbonate, as a sulphide, oxide, silicide, silicate, which, owing to the small amount of lead they contain, would be better beneficiating by roasting. No smelting ore is to be found in the district.

THOMAS P. GILMORE.

Globe City, Arizona, March 10th, 1877.

MAKING RUSSIA LEATHER.—The following story of how our late Minister to Russia discovered the method of manufacturing the celebrated Russia leather is a good one, if true, as told in the New York Tribune: When General Jewell was Minister in Russia he visited the tanneries of that country and found out the secret in the use of birch bark tar, with which the skins are dressed, in place of tallow and grease, the latter substances being so largely used for food by the lower classes. This tar, which is carefully saved as it exudes from the wood when burned, was first used as a substitute for wheel grease in Russia, as it is to this day, and then for the filling and dressing of skins. By a system of careful inquiry and literally following his nose during his visits to some of the great Russian tanneries and curriers' shops, Mr. Jewell found this compound in a great kettle ready for use, and thus the mystery was solved. It is not expensive, costing but about \$10 a barrel, and he immediately ordered 10 barrels and sent them, with instructions, to various leather manufacturers in this country. The result is that genuine Russia leather goods are now made in America, and doubtless will soon be sold at nearly 50% below former rates.

BRASS BEARINGS.—Brass for journal boxes, according to an exchange, should be made as follows: Take 10 pounds of copper, one and a half pounds tin, and one half pound spelter. Cut the copper into thin slips, and plunge into the other metals while in a state of fusion. Another process is to melt the copper first, and plunge beneath its surface lumps of zinc held in iron tongs. If it were attempted to melt the metals together, the zinc would be in a great part consumed before the mixture reached the high temperature required to melt the copper; and yet these metals combine so readily that copper is sometimes converted into brass upon its surface, merely by the fumes of the burning zinc. A layer of fine charcoal placed upon the melted zinc protects it from the atmosphere, and reduces this loss to the least amount. The usual composition of brass is in the proportion of two parts by weight of copper to one of zinc.

SCIENTIFIC PROGRESS.

Assaying for Coinage.

An address was delivered at a recent meeting of the Franklin Institute at Philadelphia, by Outbridge, on "Metallurgy and Assaying of the Precious Metals for Coinage." An abstract is given by the *Polytechnic Review*, from which we quote a few points:

Silver is received at the mint in the form of bars, pigs, dore bullion, coin, old plate, photographer's waste, etc. It often contains a variety of base metals, which destroy its ductility and color, and render it unfit for coin. The usual way of eliminating these impurities is by means of oxidizing fluxes with borax to dissolve the oxides of the base metals. The precious metal is then ready for the process of refining by nitric acid, to separate the gold, as practiced in the mint at Philadelphia. In most of the foreign mints, and at the assay office in New York, this "parting" is effected by means of concentrated boiling sulphuric acid in cast-iron kettles. In the former case the nitrate of silver is precipitated in a large tank holding 1,200 gallons, by salt water, the nitrate of soda formed is drawn off, the chloride of lead is reduced, by granulated zinc, to the metallic size; it is then pressed into large "cheeses," dried, melted in sand pots and cast into bars, or the requisite proportion of silver added for coin.

The most modern discovery in the refining of gold and silver is by the direct application of a stream of chlorine gas through the metal while in the molten state. The chlorine unites with the base metals, forming volatile chlorides which pass up the chimney. The chlorides of silver and copper are prevented from volatilizing by a protective covering of melted borax, and having a lighter specific gravity than the molten gold, they rise to the surface. The pot is then removed from the fire, the gold is allowed to "set," and the chlorides of silver and copper poured into molds. The "king" of gold is then turned out nearly pure, and the silver is reduced in the ordinary way. This method was devised by Prof. Miller, of the Sydney mint, Australia, to recover the silver contained in the native gold of that country (often amounting to as much as 14%).

The delicate processes of assaying the precious metals were described in detail and illustrated by actual analyses. The sample of gold or silver cut from the bar is carefully weighed upon a balance sensitive to the twentieth of a milligramme. The normal weight used for gold assay is the half gramme; this weight is decimally divided down to the ten-thousandth degree. A weight of pure silver is added, to make the proportion approximately two parts silver to one part gold. The alloy is enclosed in an envelope of pure lead, melted in small bone-ash cups in the muffle of a furnace. The base metals are converted into oxides, which, being much more fluid than the melted precious metals, sink into the pores of the cupel. When the button has "flashed" it is removed from the cupel and weighed; this gives the proportion of base metal. The button is then laminated, rolled into a "cornet" and boiled in nitric acid. The silver entirely dissolves, leaving a roll of pure gold. The difference between the weight of the gold cornet and that of the base metal, less the amount of fine silver added, is the proportion of silver originally present in the sample. The object of adding fine silver is because the atoms of gold would otherwise cover up and protect the silver were it not in excess.

The fire or "dry" assay is not well adapted for silver, owing to its volatility; hence the humid process invented by Gay Lussac, is employed. This is at once the most delicate and accurate process of analysis known to chemical science. In order to obtain a true sample of the metal to be assayed, a small "dip" is taken from the melted mass and poured into cold water, forming granulations. This is important, as alloyed silver segregates, on cooling, into richer and poorer alloys within certain limits. The weighed sample is dissolved in nitric acid, and a charge of salt water is added. The solution is prepared of such a strength that the pipette (holding 100 grammes) shall precipitate one gramme of pure silver. This solution is called the "normal salt solution." The bottle is agitated for a few moments to settle the precipitate. A decimal salt solution, one-tenth of the strength, and one-hundredth the volume of the normal solution, is added. If any silver remains, a cloud will form on the surface of the liquid, and the precipitate will be equivalent to one-thousandth of a gramme. In this manner the proportion of pure silver in a given weight of alloy is rapidly determined without weighing the precipitate. So accurate are these methods that the value of thousands of dollars is calculated from the assay.

A TRANSIT VISIBLE IN CALIFORNIA.—*Nature* says: The next transit of Mercury across the sun is to take place on May 5th, and is to be visible in California. MM. Andre and Sugot, already celebrated by their work on the last transit of Venus, ask of the Academy that they be placed in charge of future observations. Up to this moment they have continued their studies of the physical conditions of the phenomena which they have so well re-commenced at the observatory.

The Distribution of Animals.

The distribution of animal life, says the *Journal of Chemistry*, is one of the most interesting subjects within the domain of the naturalist. At first thought, the law of distribution seems to be a simple one. "It was long thought," as Mr. Wallace remarks in his recent work on the subject, "and is still a popular notion, that the manner in which the various kinds of animals are dispersed over the globe is almost wholly due to diversities of climate and of vegetation." But it does not require a minute knowledge of the productions of the earth to show us that this is not the case, for countries very similar in climate and physical features are found to have very different fauna. To quote a few of Mr. Wallace's illustrations:

"In the equatorial parts of Africa and America, for example, where very similar conditions of climate exist and the soil in both regions bears luxuriant forests, elephants, apes, leopards and guinea-fowls are found in the former, while in the latter their places are occupied by tapirs, prehensile-tailed monkeys, jaguars and toucans. Again, while in reference to climate and soil, a striking similarity exists between parts of South Africa and Australia, the one has lions, antelopes, zebras and giraffes; the other kangaroos, wombats, phalangers and mice. Certain districts of North America closely resemble many parts of Europe in soil, climate and vegetation, yet the former have raccoons, opossums and humming-birds; the latter their moles, hedgehogs and true fly-catchers."

The problem is not then so simple as it appears on the surface. Other factors than those of climate and vegetation must be involved, prominent among which is the relation of the existing life of the globe to its past life as illustrated by fossil remains. The geologist must here come to the aid of the zoologist, and the field of study must be widened to take in not merely the earth as it now is but the successive stages through which it has passed in the vast periods whose history is written in the "great stone book" of nature. The present distribution of animals according to Mr. Wallace, is the final product of all the revolutions in organic and inorganic nature which have taken place on the earth from the earliest geological ages.

Filtering Metals.

Professor Lampadius, Frieberg, concluded that at a certain low temperature of fusion the metallic impurities present in the more easily fusible of metals would separate, partially as such and partially as definite crystalline compounds, and float in the fused mass, from which they could be removed by filtration. Experiments by him in this direction were so far successful that the expected definite compounds were found upon the filter, but the metallic filtrate was still very impure. The filter was made of quartz, sand, slag, etc., which was not wet by molten metal. Curter, however, according to a communication by him, in trying to adapt this principle to the purification of Bohemian tin, of a commercial scale, sought for material for a filter which would be wet by the metal to be purified without being dissolved in it. Iron, with its comparatively high temperature of fusion, and its affinity for tin, as manifested in the tinning of iron, was employed for a filter; 500 strips of tinned iron, as thin as paper, about 6-10 inches long, and one-fourth inch broad, were packed tightly in a square iron frame by the aid of wedges, and the frame was then luted into a suitable opening in the bottom of a graphite crucible. The tin, melted in a second crucible, was allowed to cool until the separation of fine crystals on the surface was noticed, and thickening metallic mass was then poured into the filtering crucible, when the still pure metal passed through, and a pasty magna was left, in which iron, arsenic, and copper, concentrated to a great degree, were found combined with the tin, while the filtered tin proved to be almost chemically pure. Fifty hundred weight were purified in the crucible described. Other forms and other materials for filters are suggested, and other possible applications of the method, and in the separation of silver from lead containing the former metal.—*The Engineer*.

ALCOHOL FROM BEET LEAVES.—Pierre, assuming that the sugar found in the beet root must be elaborated by the leaves, has examined these leaves for sugar. Owing, however, to the difficulty of preparing the sugar as such, he subjected the juice expressed from these leaves to fermentation, and from the alcohol obtained, estimated the quantity of sugar. The leaves employed were collected in November, and weighed 158 kilograms. They yielded 34 to 35 liters of juice, which after fermentation, gave 275 cubic centimeters of alcohol of 68 per cent. Calculating from these data, each hectare of land would furnish about 173 liters of absolute alcohol, as a minimum.

A NEW IDEA IN PAPER.—The *Papier Zeitung* remarks that it would be an advantage if wall papers could be had which would adapt themselves to the degree of illumination, becoming darker with a greater brightness, and brighter as the darkness increased. The proposal has been made to coat the walls of rooms with oxalate of copper, which becomes dark in light, and bright again in darkness. By combination with other colors wall papers might be obtained which would present an agreeable variation in colors.

MECHANICAL PROGRESS.

Hanging Shafting.

Jesse Lord, in the *Polytechnic*, gives the following hints on putting up the shafting in a machine shop: When a proper building is provided, the hanging of the shafting should be intrusted only to a competent man, one who can previously plan the location of every machine on the floor, and the position of every pulley on the main line, if not also on the counters. Then he can know just where his hangers or brackets should be, to best sustain the weight of the heavy pulleys, and the proper intervals between them, to prevent sagging of the shaft when at rest, and its springing when in motion. If the shaft is supported by brackets on posts, an approximation to a level may be made by stretching a chalk-line along the posts and designating the top or bottom of the brackets, or the center line of the shaft on the posts. Although the line, if stretched a considerable distance, will sag some, it will be a sufficient guide for the boring of the bolt-holes. The rectification of this line can be effected, after the boxes are placed, by means of a water level—a sighting level, or some similar device—the eye being entirely reliable in testing a right line, although not trustworthy as to level. To ascertain the level, a straight edge, of good seasoned pine, planed accurately on both edges, strictly parallel, and wide enough to prevent sagging, and long enough to reach from one box to the next, should be provided. In use, one edge should be rested in the boxes, and on the other should be placed a spirit level. This is a simple, but effective device. Of course it is equally applicable to hangers and brackets.

Shims for leveling down hangers should be of wood, not leather; a yielding material, not iron wedges, generally made too narrow to give a good bearing. Probably nothing is better than seasoned, rived, cedar shingles, which are almost as hard as horn. Bolts to hangers are perhaps necessary for very heavy shafting, but they have been largely superseded by lag screws, or, as some call them, coach screws. If bolts are used the heads should be slightly convex, strengthened by washers under the head, and both washer and head partially sunk into the floor. When lag screws are used the holes for their reception should be bored only as large as the core of the screw, leaving the thread to make its own way through the wood.

Shafting is continually getting out of line or of level, from one cause or another; the walls of the building may settle, or the floor may be depressed in one spot by an unusual weight; a heavy strain by a belt may cause a cutting of a box and consequent derangement of the line. Frequent, periodical inspections should be made to re-adjust hangers and brackets, if necessary, and to ascertain if there is undue strain on any particular portion. Neglect of these duties will surely cause waste and expense.

SUGGESTION TO CAR BUILDERS.—A communication to the New York *Tribune* complains as follows: I have noticed in the cars of the New Haven, Hartford and Springfield road three massive sets of lamp holders of elaborate design, with each of their four lower corners tipped with sharp, metallic spurs, pointing down on you like so many inverted lightning rods ready to impale some poor victim should the car be overturned; or, perhaps, to hold him like a trap until the car took fire and roasted him; or, in case of a collision or possibly the sudden action of the air brakes, to be wrenched off and fall with crushing weight among the passengers. Every railway disaster, in the long list of those cut and bruised about the head and upper part of the body, tells of the horrid work of such destructive agents. Our cars should be finished inside with a view to the greatest safety in the not improbable event of their being overturned. Any sharp spur or hook is as much out of place in a passenger coach as would be a bayonet or a pitchfork. We have had too much already of these angular productions of blacksmiths and brass founders. They should be banished at once, and for a substitute a strong shelf running the whole length of the car, of such form as to give greater strength to the corners of the car, which are most liable to be crushed in by outside obstructions, and upholstered on the edge and under side, affording an elastic surface to lessen the distance and break the force of the fall in case of an overturn when the living freight is hurled into the top of the car.

A NEW ANCHOR.—A new anchor, the invention of Vice-Admiral Inglefield, C. B., has been received at Portsmouth for trial on board the *Dreadnought*. It weighs 102 cwt., and is a modification of Martin's well known self-casting anchor, with which the whole of the turret ships are now fitted. Like it, the shank and the crown are formed of one piece, but it has no stock nor "steading arms," the weight thus saved being added to that of the arms, to give them more holding power. The new anchor also resembles the Martin anchor in the special feature that the arms are on parallel lines, and so grip the ground simultaneously. It differs from it, however, in the very important characteristic that instead of the arms being made of one forging, and working through the crown, they are formed of separate forgings, and are attached to the shank by a swivel pin. The advantages gained for the anchor are greater holding power and less liability to foul.

French Steam Street Cars.

French seem to be gaining success with their application of steam to street railways. We find in foreign papers the following interesting facts: Some interesting particulars as to the success of steam over horse-power, on tramways, were given by Mr. Henry Merryweather, whose firm had sent 30 of their engines to Paris, in which city they had been adopted by the principal companies. The route over which these engines run is from the Bastille to the Arc de Triomphe, a length of about seven miles. On this road there are various inclines, that at avenue Josephine being from one in twenty-eight to one in thirty, extending over half a mile. The engines have been working for more than a year, during which time there has been no accident of any kind, neither has the ordinary street traffic been in the least obstructed or inconvenienced, and this may also be said in regard to the runnings on other lines at home and abroad.

Messrs. Merryweather's engine is much less than half the length of an ordinary tram-car, which it resembles in appearance; and therefore, in contrasting the steam power with horse power, it occupies less space than the horses of a tram-car would occupy. At each terminus it is disconnected and brought to the front of the car. This operation does not occupy more, if so much, time as is required with horses. The boiler is multitubular, so that dangerous explosions cannot occur. Each engine weighs about three tons, with sufficient water and fuel to run for four hours. The consumption of fuel is about 20 pounds weight per hour; steam pressure 100 pounds. The engines are noiseless, and emit neither smoke nor steam. The exhaust steam is disposed of by a condensing apparatus, thus the whole weight of the engine is kept to a minimum, thereby reducing, very considerably, the working expenses, and the wear and tear on the permanent way. The engines have all four wheels coupled; they can ascend heavy inclines, and from their short wheel base they can pass round the sharpest curves, and they are sufficiently powerful to draw two loaded cars. They can be propelled at any required speed at the will of the driver; the brake power can be immediately applied, pulling up the car far quicker than can be done at present with the ordinary horse cars. The engine is fitted with the necessary self-acting appliances for shutting off steam and applying brakes, if the driver should exceed the prescribed rate of speed. The starting and other levers, as well as the fire hole door, are ready to the hand of the driver, who has an unobstructed view of the roadway on all sides.

TESTING STEEL-IRON WELDS.—In a late issue of the *Railroad Gazette*, J. K. Sax gives the method which he employs to detect a perfect weld between the iron and steel in his car wheels: "We know in every instance before the wheel is sent out whether we have a perfect weld or not, simply by turning the edge of the thread of the wheel, which is now done in all cases. Therefore, if the weld is perfect, when the tool reaches the junction or union of iron or steel, the turnings even on the extreme edge of the wheel, as they leave the tool, being part steel and part cast iron, in a perfect weld will stick firmly together and be inseparable, even though they may be not more than a 64th part of an inch in thickness. On the other hand, if there is not a perfect weld, the iron will invariably be separated from the steel in the turnings as they leave the turning tool, thus making a sure means of detecting any imperfections in the weld. So finding a perfect weld on the outer edge of the thread is a sure indication of a perfect weld in the center of the thread of the wheel."

THE PARIS EXPOSITION.—A London letter says: Two thousand laborers, busy as ants, were employed in giving shape and beauty to the latest marvel of architecture. The general disposition of the new building will more or less resemble that of 1867, the principal difference consisting in altering the elliptic form of it. The galleries will thus present a more striking aspect and the decorations of each division, which will be either square or oblong, will be more easy to exhibitors. The galleries on the right, forming the foreign section of the building, will be divided by spaces of different breadth, according to the importance of each nation. In walking from the Pont d'Iena to the military school a visitor will thus be enabled to see the productions of all the people of the world, and may compare the relative value and perfection of the same goods in different countries. To compare a French article, however, with a foreign article of the same sort the visitor will have to cross the fine art galleries or return to the grand vestibule.

NEW AERIAL MACHINE.—Experiments were made recently at Chatham, England, with a new aerial machine, to be used for discovering the position, etc., of an enemy's camp at night. The machine consists of a light frame work covered with loose canvas, which becomes filled with air, and thus the machine is kept aloft. When at a proper height a parachute provided with fire balls is sent up the line holding the machine; and, on reaching the machine, the parachute explodes, and the fire balls are discharged, and thus the surrounding country is lighted up for a considerable distance, and the position of an army would be shown. The trials proved very satisfactory, in spite of bad weather, and further experiments will be made.

Table of Highest and Lowest Sales in S. F. Stock Exchange.

Table with 5 columns: Name of Company, Week Ending Mar. 8, Week Ending Mar. 15, Week Ending Mar. 22, Week Ending Mar. 29. Rows include Alpha, Andes, Baltimore Con., Belcher, Belmont, Best & Belcher, Bullion, Caledonia, California, Challenge, Chollar, Confidence, Con Imperial, Con Virginia, Crown Point, Cose Con, Dayton, Eureka Con, Exchequer, Gaden & Bertrand, Seg Belcher, Grand Prize, Gila, Globe Con, Gould & Curry, Hale & Norcross, Hussey, Julia, Justice, Jackson, Kenuck, Knickerbocker, Kossuth, Lady Bryan, Lady Wash, Leopold, Leviathan, Leeds, Modoc, Manhattan, Mansfield, Meadow Valley, Mexican, North Con Virginia, North Con, Northern Belle, Norcross, Occidental, Ophir, Overman, Pacific, Phil Sheridan, Panther, Poorman, Prospect, Raymond & Ely, Rock Island, Savage, Seg Belcher, Sierra Nevada, Silver Hill, South Chollar, Succor, Union, Union Con, Utah, Wells-Fargo, Woodville, Yellow Jacket.

Sales at S. F. Stock Exchange.

Table with 2 columns: Name of Company, Sales. Rows include Friday, A. M., Mar. 23, 220 Alpha, 200 Andes, 350 Baltimore Con., 230 Best & Belcher, 200 Belcher, 300 Bullion, 230 California, 1500 Con Virginia, 100 Challenge, 400 Chollar, 820 Caledonia, 25 Dayton, 645 Exchequer, 1000 Gould & Curry, 400 Hale & Norcross, 310 Justice, 500 Julia, 300 Knickerbocker, 100 Kossuth, 100 Lady Wash, 345 Mexican, 150 New York, 50 Occidental, 425 Ophir, 370 Overman, 190 Phil Sheridan, 190 Savage, 400 Sierra Nevada, 40 Silver Hill, 500 Union, 300 Woodville, 500 Yellow Jacket. Afternoon session includes 120 Alpha, 140 Andes, 140 California, 140 Chollar, 350 Caledonia, 25 Dayton, 645 Exchequer, 1000 Gould & Curry, 400 Hale & Norcross, 310 Justice, 500 Julia, 300 Knickerbocker, 100 Kossuth, 100 Lady Wash, 345 Mexican, 150 New York, 50 Occidental, 425 Ophir, 370 Overman, 190 Phil Sheridan, 190 Savage, 400 Sierra Nevada, 40 Silver Hill, 500 Union, 300 Woodville, 500 Yellow Jacket.

Table with 2 columns: Name of Company, Sales. Rows include Wednesday, A. M., Mar. 28, 100 Alpha, 330 Andes, 270 Best & Belcher, 195 Belcher, 175 Best & Belcher, 210 Crown Point, 1200 Con Imperial, 285 California, 40 Chollar, 425 Confidence, 710 Crown Point, 50 Challenge, 800 Dayton, 225 Exchequer, 1795 Gould & Curry, 200 Hale & Norcross, 495 Julia, 325 Justice, 340 Lady Washington, 140 Knickerbocker, 300 Leviathan, 35 Mexican, 450 New York, 600 North Con Vir., 50 Occidental, 530 Ophir, 145 Overman, 150 Phil Sheridan, 100 Rock Island, 400 Savage, 150 Sierra Nevada, 130 Silver Hill, 30 Solid Silver, 200 Trojan, 40 Utah, 210 Union Con, 200 Woodville, 160 Yellow Jacket. Afternoon session includes 400 Alps, 205 Bullion, 150 Chollar, 615 Best & Belcher, 400 Caledonia, 30 Chollar, 210 California, 250 Con Imperial, 130 Crown Point, 400 Con Virginia, 400 Eureka Con, 100 General Thomas, 750 Grand Prize, 80 Gila, 305 Gould & Curry, 230 Golden Chariot, 110 Justice, 60 Manhattan, 200 Mansfield, 300 Modoc, 200 Northern Belle, 500 New Cose, 80 Ophir, 90 Overman, 1000 Panther, 15 Raymond & Ely, 450 Rye Patch. Thursday, A. M., Mar. 29, 100 Alpha, 330 Andes, 270 Best & Belcher, 195 Belcher, 175 Best & Belcher, 210 Crown Point, 1200 Con Imperial, 285 California, 40 Chollar, 425 Confidence, 710 Crown Point, 50 Challenge, 800 Dayton, 225 Exchequer, 1795 Gould & Curry, 200 Hale & Norcross, 495 Julia, 325 Justice, 340 Lady Washington, 140 Knickerbocker, 300 Leviathan, 35 Mexican, 450 New York, 600 North Con Vir., 50 Occidental, 530 Ophir, 145 Overman, 150 Phil Sheridan, 100 Rock Island, 400 Savage, 150 Sierra Nevada, 130 Silver Hill, 30 Solid Silver, 200 Trojan, 40 Utah, 210 Union Con, 200 Woodville, 160 Yellow Jacket. Afternoon session includes 400 Alps, 205 Bullion, 150 Chollar, 615 Best & Belcher, 400 Caledonia, 30 Chollar, 210 California, 250 Con Imperial, 130 Crown Point, 400 Con Virginia, 400 Eureka Con, 100 General Thomas, 750 Grand Prize, 80 Gila, 305 Gould & Curry, 230 Golden Chariot, 110 Justice, 60 Manhattan, 200 Mansfield, 300 Modoc, 200 Northern Belle, 500 New Cose, 80 Ophir, 90 Overman, 1000 Panther, 15 Raymond & Ely, 450 Rye Patch.

Sales of Last Week and This Compared

Table with 2 columns: Name of Company, Sales. Rows include Thursday, A. ment of his stock had been paid, at which Dr. Sigismund stated that he could not really come under the head of the dissatisfied ones, as he had acquiesced in the decree of the levying of the assessment; but Mr. Fox, of the combination that had been foremost at previous times, wished the dissatisfied of the present time to join in with those who for several months have been contending against the legality of a former assessment. Wm. Reynolds was elected Secretary. A committee of five, consisting of Messrs. Dr. Sigismund, Fox, McIntosh, Kiby and Tarpy, the committee of the old dissatisfied stockholders, was appointed to carry out the affairs of the present dissatisfied persons. A committee of three was also appointed to confer with the committee of five and to act in concert with it. There were represented 2,500 shares.

In the Third District Court, Joshua Hendy brings suit against the Martin & Walling mill and mining company to recover \$1,025, alleged to be due for services rendered.

Concerning the Comstock's Gold Hill News of this week says: Crossman's report of the discovery of another good bonanza lying east and south from the present wonderfully rich bonanza of the Consolidated Virginia and California has created quite a stir among the sanguine, and that bonanza would certainly be a good thing to have. But its existence never has been practically or satisfactorily demonstrated yet, the report of any over-sanguine expert or mining man to the contrary notwithstanding. The Sutor tunnel, however, will satisfactorily demonstrate this and kindred points, for it is now in 16,400 feet, and fast penetrating the regular Comstock ore belt at a considerable depth. All outlying ore bodies east of the main Comstock are likely to be met with and their merits developed by the tunnel. The Consolidated Virginia folks are getting their work in well, and producing large amounts of good ore again, keeping their mills well running, and the bullion results have to follow. They will have a bountiful surplus over expenses next month, and be fully able to resume the payment of dividends in May. The newly-developed 1650-foot level is being opened out in good style, and the ore breasted and stoped after the usual way, both in that and the California ground. Justice continues her excellent ore yield, the mills are running and work goes ahead lively all along the great lode, regardless of the price of stocks.

The Mining Share Market.

The depression in the stock market continues and there is little new to chronicle in connection with it. It is now positively asserted that Consolidated Virginia will resume the payment of dividends on the 1st of May, which, if it prove true, will undoubtedly have a beneficial effect on the market. At present, transactions in the Boards are on a very small scale, and are principally confined to the brokers themselves, working on the ups and downs of an eighth in the price of a stock. The general public is undecided as to which way the market intends to go, but seems at the same time decided not to invest very much any how. Brokers are having a hard time of it and will soon have to reduce expenses materially should the present depression continue very much longer. A meeting of the Lady Bryan stockholders who paid the last assessment (No. 14), and who are unwilling to pay the present assessment (No. 15), was held on Tuesday evening last. The Chairman of the meeting stated that the assess-

Pacific Board-Latest Sales.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

TALLMAN.—Amador Ledger, March 24: The mine was located in early days, and worked to a considerable depth under the name of the Hubbardville mine. Three shafts were sunk. The south or main shaft is down 500 feet. It is not yet drained, but a body of quartz four or five feet wide is said to exist at the bottom. A few months back John Troglan was led to turn his attention to the old Hubbardville, which he rechristened the Tallman. Organizing a company he started work, putting up some of the finest pumping and hoisting machinery to be seen in the State. Only a short time elapsed before the prospects became sufficient to justify a ten stamp mill, which was commenced by Messrs. Knight & Co., of Sutter. At the outset the ledge at the bottom of the south shaft was the objective point. It did not enter into the calculation that ore of any consequence existed above that. In this, however, they have been greatly deceived. Finding a drift from the middle to the south shaft for ventilation, a splendid body of rock was struck at a distance of 100 feet from the starting point. The ledge varies from two to three feet in width, with a boulder ledge two feet in width, the two separated by a foot gouge. The rock is of that dark streaked kind so much prized by miners. It is full of rich looking sulphurates, with specks of gold for good measure. The mine is kept running on ore from this drift. As to the paying quality of the rock, scarcely a doubt need be entertained; good judges estimate it to yield all the way from \$15 to \$25. In addition to the main lead upon which the three above mentioned shafts are sunk, two other distinct veins have been lately discovered, one 40 feet east and the other 75 west. Both contain gold in paying quantities. Supplied with every labor-saving appliance, it is safe to say there is not a more economically worked mine in the State. No steam is used on the works. Everything is run by water power. With a fall of 320 feet, 40 inches of water is all that is required to run the whole machinery. Seventeen men are employed, the whole under the direction of John Troglan, the lessee.

THE CORNER.—Located a quarter of a mile south of the Tallman. It has lately been bonded by H. Ross and others. Many years ago a shaft was sunk 70 feet. Last week we visited the claim, and found half a dozen men engaged in sinking a new shaft, a few yards south of the old works.

OLIVE.—We last week mentioned that the clean-up of the Olive rock realized the handsome sum of \$18 per ton. The owners are very gleeful over the result. It is now the intention to get the whim and hoisting gear from the Bonanza mine, and sink the shaft to 320 feet from the surface. Should the ore chimney hold out at this depth, the erection of a mill will be next in order. The finances of the company are in excellent shape.

BONANZA.—On this mine preparations are being made to sink. Everything is to be fitted up to run by water power. The works will enable the mine to be explored to a depth of 500 feet.

CALAVERAS.

THE THOR.—Calaveras Chronicle, March 24: We have intelligence of a cheering nature from the Thor mine at Rich Gulch flat. The tunnel being run in the mine is now 280 feet, and has cut the ledge at a depth of 100 feet. The vein shows fully three feet thick, all fair milling ore. Running the rock in 300 feet further will reach a point where the ledge over 200 feet beneath the surface, putting the mine in splendid condition for working. The battery is kept in constant operation and work is being urged forward with great energy.

GWIN.—The sinking for the 1300-ft level at the Gwin mine is completed. It is expected to commence running the levels about the first of April. There is still an abundance of rock in the 1300-ft level, from which the ore is supplied. An average of 110 tons per day are put under the stamps, the yield not varying from what it has been for several months past. Indications are favorable that the 1300-ft level will develop better rock than is now being mined.

HUGHES.—Over 100 tons of ore is on the dumps of the Hughes mine in Chile gulch. The shaft is sunk to the depth of 100 feet, 1 vein run and stope opened. The mill is not running at present, but the work of hauling rock is to be commenced soon and the stamps set at work. The ledge is a wide one, and we get it from good authority that the unassorted ore will yield an average of \$10 per ton.

BLAST.—A blast was exploded in the Veith hydraulic last Tuesday, doing good execution. The amount of powder burned was 100 lbs. being ten kegs of dynamite. Preparations are being made for another and larger blast, one of the objects being to test a new kind of powder.

UPPER COUNTRY ITEMS.—A new vein of quartz has been struck in the Champion mine at West Point. The ledge is about two feet wide. Rock rich. There is something like 80 tons of ore now in the mill and crushing has been commenced. It is expected that 100 tons will be worked before crushing is completed. Fields & Co. continue to mine good ore. The machinery has been removed from the Mina Rica and placed upon the Austrian mine, owned by the same company. Prospects good. Ninety tons of rock from the Chapman mine at Railroad brought \$30 per ton. Operations are to be pushed with increased vigor in the future. At Mosquito, Potter & Rogers continue to extract rich rock from the "Blue Jay." Crushing will be commenced next Monday. Work is progressing favorably at the old Holmes mine.

FRESNO.

MORE GOLD.—Fresno Examiner, March 22: We noticed three weeks ago the circumstance of a \$30 and a few smaller nuggets of gold having been recently found on the Fresno River, not far from Deadwood, which had induced several parties to prospect in that neighborhood. One of the parties, a Mr. Conoly, was rewarded on Thursday last by the discovery of a well defined vein of rich gold quartz; from present indications it bids fair, we understand, to create quite a sensation.

INYO.

GOLD MINE.—Coso Mining News, March 24: Two of our prominent citizens, F. J. Trapp and H. J. Lent, are erecting a three-stamp gold mill over in old Coso. They expect to have the mill in operation in two weeks. We should like very much to see a five or ten-stamp mill being run in the Coso. There is a large quantity of gold rock which works over \$100 by the assay process.

GOOD ORE.—W. T. Grant, the indefatigable prospector, is working his new discovery, the Pacific, in Lookout district, and taking out quite a lot of fine milling ore, that averages \$300 per ton. Grant will endeavor to have some of his ore worked at the Minnetta mill to test it.

COSO.—We are glad to report that, so far as we can ascertain from the parties who have recently been in the Coso, that the company is now meeting with good success in smelting since Messrs. Robinson and Arents have taken charge of things. The mine is looking extremely well in all its workings, and when the hoisting works are completed, will furnish ore enough to keep both furnaces in constant operation.

MODOC.—We are informed that the Modoc is developing to an unprecedented extent, large ore bodies having been developed in nearly every one of the numerous drifts, tunnels and shafts. Both furnaces are running finely and turning out the usual quantity of high grade bullion. The DeLancey furnace, since starting, has been running very successfully with the exception of about 10 hours. The stick work on top of furnace No. 1 was seen to be cracking, and it was shut down for repairs, and No. 2 was started instead. No. 1 may have to be built over; it is found that it cannot be drawn together with clamps, but Mr. Gorman thinks that in another week he will have to employ both furnaces in order to dispose of the ore now

being taken from the mine. Not quite so many bars of bullion are now being made as upon the last run, because of the ore carrying a greater percentage of silver and less of gold, but the amount of which was not so great. The starting amount of ore at the furnace dumps has increased instead of being diminished, although the furnace casts the ore up at the rate of about 25 tons per day.

NAPA.

QUICKSILVER.—Cor. Napa Register, March 24: The Manhattan mine, three miles beyond and to the left of Knoxville, is working 60 men and is taking out 100 flasks of quicksilver per month. They have but one furnace. The Reed mine, which is still further up and to the right of the Manhattan, employs 74 white men and 33 Chinamen. They have two furnaces and intend putting up the third soon. The furnaces are undergoing repairs. The future prospects of this mine are very flattering, there being an abundance of ore already in sight.

NEVADA.

RICH DIRT.—Nevada Transcript, March 23: The Cold Spring gravel mining company are making some very encouraging developments of late in their mine. Last week a tunnel, which they have been running for some time, struck with a body of gravel about six feet in depth, which prospects very rich. The gold is in regular nugget shape, and each pan is worth all the way from 50 cents to \$1.50. From the character and shape of the gold, all old hydraulic miners say \$10 chunks are just as liable to be found as smaller ones. The gravel also contains large quantities of flint, which will yield \$20 to the ton by mill process. In the other parts of the mine the prospects are equally flattering. The owners are in high spirits, and all who know anything of the character of the Live Oak channel, think they have got the thing corralled sure this time. Adjoining claimants on the same lead, of course, are not very down-hearted just now.

SHIVERS MINE.—We have not as yet had an opportunity to visit this mine, as the shaft gravel mine, situated beyond Banner hill, but we learn from the Superintendent, Mr. Duncan, that the prospects of opening up a good claim there are first-rate. The prospect incline is now down 210 feet, and a body of gravel, six feet in thickness, is above the incline, and it prospects very well. The locality is not one where it has heretofore been supposed that a channel existed, but from the reports we hear it appears that the mine is a very rich one. The same Superintendent is running a prospect shaft for gravel on Little Deer creek, near the Union mine, near the old Banner.

OLD DUMP PILES.—Grass Valley Union, March 20: There are several hundred old dump piles around about this place. Most of these would pay to work, provided water for washing them could be procured. We understand that the Bar has refitted and again turned on water, and a thin, the dump pile at the old Forest Springs mine. They got \$1.50 a day to the hand in free gold, and they have saved the quartz separate from the actual waste. The quartz, of which there is a goodly quantity, as there is in all the old dumps, has milled about \$65 to the ton. Three men, who are at work, are making a good bit over wages, with ground enough to last them for three years. The Forest Springs mine is not the only one where such things can be done.

PLACER.

ITEMS.—Dutch Flat Forum, March 22: Our ditches are still running full to their utmost capacity. The Star & Union, Elmore Hill and Summersett continue washing. The Bar has refitted and again turned on water, and is fast approaching the shaft. A powder blast will be put off in this claim in the latter part of the week, when washing will be again pushed. The Franklin fired a blast of 250 kegs of powder on last Saturday, doing good execution. Water was turned on on Tuesday, and the mass of clay, gravel and cement was so disintegrated that the moment the water touches it it dissolves and passes off like so much ash. The Southern Cross and Polar Star continue washing. The Pacific has refitted and turned on water last Friday. The Central cleaned up on Saturday and is now refitting. At Gold Run, the Cedar, Gold Run, North Star and Illinois claims continue washing. The Hoskin claim is clearing away and passing through the immense clay streak in order to reach their pay gravel. The cement mill continues to hammer away. The Indian Hill is washing on the gravel loosened by the powder blast of a few months since. The miners are pushing their claims forward with their usual energy.

REMINOTON HILL.—The Rhode Island company continues to ground sluice with good results. The Wide West company are working a good many men at present, and are laying a supply of timbers, lagging, etc., and advancing both tunnels. The gravel in tunnel No. 2 is of usual richness, but it will take some time to reach the pay gravel. The Pacific has refitted and turned on water last Friday. The Central cleaned up on Saturday and is now refitting. At Gold Run, the Cedar, Gold Run, North Star and Illinois claims continue washing. The Hoskin claim is clearing away and passing through the immense clay streak in order to reach their pay gravel. The cement mill continues to hammer away. The Indian Hill is washing on the gravel loosened by the powder blast of a few months since. The miners are pushing their claims forward with their usual energy.

LOWELL HILL.—The air tunnel connected with the Swamp Angel mine caved last week, preventing any more work being done until remedied, which will be done by forcing four-inch iron pipe, through which the air will be forced by a water blast. The East New York company have the running on the bedrock tunnel to the ledge mine by contract. The Wild Cat and Leavitt companies are making good progress in their tunnels. The Connet company will commence the construction of a new tunnel in a short time.

BEAR RIVER MINES.—The Centennial, Crissman and Whipple companies have been working in gravel for several days that is very rich, some of it paying as high as \$80 per ton. The work on the bedrock tunnel to the ledge mine by contract. The Wild Cat and Leavitt companies are making good progress in their tunnels. The Connet company will commence the construction of a new tunnel in a short time.

LIBERTY HILL.—The Liberty Hill company continue to wash steadily; having plenty of water, the progress being made is good.

LITTLE YORK.—The Empire and Christmas Hill companies are making unusual good progress, the ditches are running full and the water is being utilized to good advantage.

PLUMAS.

MORE QUARTZ.—Plumas National, March 24: Quite an excitement has been on the boards for a few days over the discovery of a quartz ledge in the head of Soda creek, by J. Ellis. The work on the bedrock tunnel to the ledge mine by contract. The Wild Cat and Leavitt companies are making good progress in their tunnels. The Connet company will commence the construction of a new tunnel in a short time.

ITEMS.—We saw some regular old-fashioned lead gold, some of the pieces weighing \$20 and over, the other day. It was from a claim owned by a man named Wilson, at Oak Flat, a short distance below Shoo Fly. Several caves are reported on the Maxwell company's new ditch. Mr. C. Gurnee, of San Francisco, one of the principal owners of the Hungarian mine, has been at that place for several days and started home on Friday. The chances for a good run of water this season are decidedly slim at Hungarian, but it will come all right by and by. Steve Libby has bought C. Galpin's claim on Massac, and Galpin is opening some new diggings on Squirrel creek.

SAN BENITO.

ANTIMONY.—San Benito Advance, March 24: About 60,000 pounds of crude antimony ore from the mines near us is now at the depot ready for shipment to San Francisco. The average value of this ore is \$50 per ton. Several shipments have already been made with profitable results. Probably the Salinas mine under Shrewser's management is better developed than any other of the number now being worked. The croppings of this ore can be traced for miles, and we have every confidence in the existence of inexhaustible deposits of antimony in the McLeod mining district. Among the principal mines in the district are the Stayton, the Consolidated Wonder, the Comstock and the Ralston, all owned by incorporated stock companies. Prospects are good, and the mining claims and other companies will doubtless be organized. The quicksilver and antimony prospects of the county are equal to any in the State.

SONOMA.

COAL.—Sonoma Democrat, March 24: Since our last report the Santa Rosa coal mining company have developed a well defined coal vein of three and one-half feet. It is

pronounced by experts to be the best coal yet found in California. On Wednesday arrangements were made to work the mine on a scale commensurate with its merits. The company are composed of the leading capitalists of the county, and propose to start at once a double track working tunnel. The parties who have taken the matter in hand is a guarantee of the merits of the mine and its speedy development. The S. F. & N. P. R. R. Co. have agreed to put in a branch track from their road to terminate at or near White Sulphur Springs.

Mining Activity.—Russian River Flag, March 22: Mining notices are being posted daily in this section, designating new and renewed locations, and claiming privileges to mine for gold, silver, copper, quicksilver or sulphur. Prospecting parties are constantly met, fling out for the hills in search of hidden treasures. The Great Eastern, with one Eames furnace, and the Mt. Jackson, with three, are steadily running. One week ago last Monday, several parties located claims a few miles northwest of Healdsburg, with the object in view of mining for silver. The Oakland, northwest of Pine Flat, in charge of Superintendent Dennis, still proves itself to be a mine. W. C. Graves is negotiating with parties for the development of his claim, Eureka. Life is very brisk at the Bacon, four miles easterly from Pine Flat. The improved Eames furnace, drawing to completion under the supervision of Messrs. Bacon and Eames, keeps a large force of teamsters and men employed, transporting and putting in place the machinery and bricks for the furnace, and lumber for the buildings. The machinery of Sylvester Charles's improved quicksilver furnace came up from San Francisco last week. It was fitted up by Mr. Charles and S. T. Harrison, in North Healdsburg, and has since been shipped to the Mt. Jackson mine, near Guerneville. Its practical working is looked forward to with much interest by operators of quicksilver mines. Mr. Easton, a professional mining engineer, informs us that he has just discovered the origin of the rich "float" that attracted much attention from the miners at Pine Flat, in the palmy days of that mining town. The ledge he has found is not more than 1,000 feet from the flat, and from it he has taken one piece which he calls 50% cinnabar, fully as rich as the best of the float that has been found. The ledge crops out on the old "Norris" claim and consists of a strata of clay between two well defined walls, and contains the deposits of this wonderfully rich cinnabar. It has long been acknowledged that when this ledge was found, it would prove the richest in the whole region, and hundreds have prospected for it in vain. On the strength of the find, Mr. Easton informs us that he has purchased, in company with parties in San Francisco, the bankrupt property of Thompson Brothers, at Pine Flat, consisting of hotels, stables, stores, etc. There is some litigation going on, but a small force of hands was sent up Monday, to open the ledge still more thoroughly.

A NUGGET.—Tuloume Democrat, March 24: Francis Roleri, while mining on his claim between Columbia and Yankee Hill, found a chipmunk worth about \$700 last Wednesday. When the find was first reported in Columbia, the chipmunk was a nugget worth between \$20,000 and \$30,000, and the news of the find spread like wildfire. Every old resident began to hunt around for pans, sluices and shovels, preparatory to "stalking out" as they did in the good old days, but when the piece dwindled to a \$700 chipmunk, the excitement rapidly dropped below par. Roleri considers himself fortunate nevertheless.

Nevada.

WASHOE DISTRICT.

COSO VIRGINIA.—Gold Hill News, March 23: Daily yield, 400 tons of ore, keeping the mills steadily running. The yield of ore from the stope on the 1550-ft level continues good and the ore of an excellent quality. On the 1400-ft level 30 men to the shift have been regularly employed since the air connection was completed in cutting out and clearing the tunnel west of the drift. The payment is, however, fast approaching completion, and by the 4th or 5th of April next the tracks will have been laid, the sill timbers all in, and the openings completed to a sufficient extent to admit of the extraction of 400 to 500 tons of ore per day, if the management so desire. The south drift running through the ore vein to connect with the deep vein is in a distance of 62 feet, the face still in ore of a very rich character. The management is making the payment of a sufficient quantity of ore for the resumption of the payment of regular dividends, beginning with the first of May next, is an assured fact.

CALIFORNIA.—Daily yield, 550 tons of ore, keeping the mills all crushing. The ore stope are showing splendidly on the 1550, 1550 and 1600-ft levels. The yield of bullion for the month of March will not exceed by \$100,000 or more the yield of the month of February. The payment of the regular monthly dividend of \$1,080,000. On the 1650-ft level the ore vein is opening up richly wherever it has been prospected. The north drift has been enlarged, and is now being pushed forward to connect with vein No. 3 for ventilation purposes and to establish a base of operations for breasting the ore whenever it may be desirable to do so. The hoisting machinery, mine, mills, in fact everything for the whole company is in the best working condition, and there appears to be nothing to interrupt bullion production and the payment of the regular dividends.

CICILLAR-POTSOL.—Daily yield, 100 tons of ore. This ore is from the old upper works and has an assay of \$27 per ton. The east drift from the main incline on the 1785-ft level is steadily advancing toward the ledge, the face in very favorable position, and sinking the Combustion shaft is making the best progress. This shaft is without exception the best designed working shaft for a deep mine on the Comstock ledge, if not on the entire Pacific coast. It has four splendid working compartments, timbered from top to bottom with red spruce, 14x14 inch timbers, and in places where the ground is somewhat heavy, these timbers are placed only four feet apart, the usual distance being five and one-half feet. The excavating machinery is in the best working condition, and there appears to be nothing to interrupt bullion production and the payment of the regular dividends.

BULLION.—A serious accident to the hoisting engine on Saturday last has temporarily stopped all work on the 1500-ft level. The hoisting engine suddenly gave way, making it necessary to remove the old engine and replace it with a new one. In the meantime the work on the 1600, 1700 and 2000-ft levels is progressing as usual, the hoisting from those levels being done through the Imperial Com.

CALIFORNIA.—On the 1200-ft level the east cross-cut near the north line has cut the ledge, which at that point shows a fine quartz formation, with encouraging ore prospects. Sinking the main shaft is going ahead at the rate of 15 feet per week.

JOSKE.—Daily yield, 400 tons of ore, keeping the mills crushing to fine capacities. The bottom of the south winze, sinking on the ore-vein below the 800-ft level, is still in fine ore, with every prospect of the ore vein widening as greater depth is attained. The water is being drained from the bottom of the main incline below the 1000-ft level, preparatory to sinking for the purpose of opening the mine at still greater depth.

JULIA.—The main south drift in the 1000-ft level is being pushed forward, the face in quartz and ore of a very hopeful character. On the 1800-ft level west cross-cut No. 3, recently started, has been pushed a distance of 50 feet to the westward, without yet finding the west wall. For that distance the entire size of the drift is in quartz and low-grade ore. The main south drift on the 1800-ft level, at a point 40 feet south of the west wall, No. 3, has advanced some 10 feet, running along through the vein. Passing through this clay slip, a much softer and better character of quartz and ore has been found, strongly confirming the opinion of the experts that the chances of finding a paying body of ore to the south and east is steadily growing better.

OVERMAN.—The main east drift on the 1400-ft level is steadily though slowly advancing toward the vein. The flow of water from the face of this drift is very strong and intensely hot, so that the utmost care has to be observed in every attempt made at advancement.

LADY WASHINGTON.—A considerable portion of the past week has been occupied in casing a portion of the timber in the main shaft and timbering the winze below the 850-ft level. This has been about completed.

NORTH COV. VIRGINIA.—Sinking the shaft is being pushed forward with vigor. Streaks of quartz of a favorable character are frequently met with.

DAYTON.—The east cross-cut on the 220-ft level is being steadily advanced, the face in more favorable ground. The cross-cuts on the 500 and 700-ft level are showing some very favorable ore prospects.

UTAH.—The west drift on the 1150-ft level is now in a distance of 75 feet.

SOLID SLIVER.—Face of main north tunnel showing well in good looking vein matter. East cross-cut pushed ahead through the vein, which is thus far rather low grade ore, with occasional streaks, which give good assays.

LEVATHAN.—Considerable improvement is shown in the main north drift at the 600-ft level, the whole face being in quartz and low-grade ore.

SITRO TEXAS.—Total length of tunnel from mouth to header, 10,400 feet. Face of header in porphyry, with clay seams and occasional streaks of quartz. Good regular progress is constantly being made.

FLORIDA.—The west drift on the 815-ft level is being pushed rapidly forward, the face in porphyry mixed with quartz of a fine character.

ALTA.—The shaft is now rapidly approaching the point at which it is expected the ledge will strike.

KNICKERBOCKER.—The reduction of the water in the shaft has gone forward very successfully, and the bottom of the shaft will be reached some time to-morrow. The shaft is in good condition. To-morrow work will be actively resumed in the 600-ft level, where good ore developments were already made before work was suspended and the mine allowed to fill with water.

REVERIE.—The north and south drifts on the 650-ft level are each steadily advancing, running nearly parallel with the ore vein. On the 444-ft level the main south drift on the east side of the ore vein is being rapidly driven forward, the face in soft ledge matter.

BECKER.—The water has again been drained to the bottom of the main incline. Sinking the drain shaft is making the best progress. The pumps are being put in as fast as the shaft can be sunk, and are to be put in a new set. The preparations for opening up a new level at the 1800-ft station are rapidly approaching completion.

YELLOW JACKET.—The north winze on the 2040-ft level is down 160 feet with the incline of the ledge. The bottom of this winze is in perfectly dry ground, very favorable for sinking. Both of the east cross-cuts from the north and south drift on the 2040-ft level are steadily advancing, without any change of value. At the bottom of the new shaft there is a considerable flow of water.

MEXICAN.—The main north drift on the 1700-ft level is being pushed rapidly forward, the face in very favorable quartz and low-grade ore.

GOULD & CURRY.—All work in the main south drift and the east cross-cut on the 1700-ft level has been temporarily suspended, in order to give the full use of the hoisting machinery with which to lower the pumps and pump-rods into place.

BEST & BELCHER.—All three of the east cross-cuts on the 1700-ft level have been stopped since last Friday, in order to have the full use of the Gould & Curry hoisting machinery with which to lower the pumps and pump-rods into place ready for use.

CROOKS CORNER.—The east cross-cut on the 2000-ft level is rapidly advancing, the face still in hard porphyry. The Burleigh drills operate splendidly in that character of rock and are sending the drifts forward at a very rapid rate. Every preparation is being rapidly perfected for the opening up of the new level and the prospecting of the 300 feet of virgin ground lying between it and the level above.

VALLEY AND AMERICAN FLAT.—The northeast drift on the 1400-ft level is being pushed rapidly forward, the face in quartz and ledge matter which is steadily improving in character as the drift advances.

NEW YORK.—Work on the pump shaft is making excellent progress. The enlargement is steadily nearing completion.

IMPERIAL CON.—The bottom of the main incline has been cleaned out and sinking resumed. The east cross-cut near the center of the mine, on the 2000-ft level, is showing a decided improvement in the face.

SOUTH COMSTOCK.—The shaft is progressing well, having passed the 400-ft level and sinking deeper in good working ground. Stringers of quartz, carrying metal, are constantly coming in.

UNION CON.—The face of the north drift on the 1300-ft level is in soft, favorable ground, showing a lively looking quartz. The quartz in the bottom of the north winze, below the 1300-ft level, is showing a decided improvement in both looks and quality.

SAVAGE.—Another break-down of one of the pump bobs during the first part of the week greatly impeded draining operations and permitted the water to rise in the shaft to within a few feet of the 1900-ft level.

MINN.—The drift at the 1400-ft station is in 70 feet, the face in porphyry which, though somewhat hard, admits of excellent progress.

PHIL SHERIDAN.—The east drift on the 400-ft level is rapidly advancing toward the ore vein, the face in soft vein matter of a very favorable description.

GALENA DISTRICT.

LOOKING UP.—Cor. Reese River Revue: Galena is looking up, and now I have more faith in the camp than I have had for years. The white mine is to be thoroughly prospected and worked systematically, and if it has any merit it will be made to pay. The company at present are employing between 50 and 60 men, which will probably be increased to 100 by the time the roasting furnaces are in operation. The Copper concentrating mill, on Willow creek, is running steadily and producing a fine shipping ore per day, and there appears to be ore enough in the mine to keep the mill running for some time.

WHITE PINE DISTRICT.

EBERHARDT AND AURORA TUNNEL.—Eureka Sentinel, March 24: Capt. Frank Drake, who arrived in town last evening, informs us that the tunnel being run by the Eberhardt and Aurora company is now in a distance of a little over 1,000 feet, and that work on it is being pushed to its fullest capacity. The Captain does not expect to strike a ledge until about 1,000 feet more have been completed, when he feels confident of striking something pretty good. While running the first 1,000 feet they ran across two seams of good looking quartz, but they were only a few inches in thickness. He reports the town of Hamilton as being extraordinarily dull, and does not have much hope for improvement during the coming summer.

FOUL AIR.—White Pine News, March 24: Much annoyance is being experienced in the Eberhardt and Aurora company's tunnel from bad ventilation. A furnace is being constructed which will be completed in a day or two, to supply the workmen with pure air from outside and carry off the vitiated atmosphere caused by blasting.

HENRY TUNNEL.—We are informed that Major Henry is expected back from the East about the first of April, when additional force will be put on the tunnel. Mechanic James Montgomery is now engaged in putting the machinery in proper working order, and the work on the tunnel that the company have determined to push this enterprise forward with all possible speed.

CORNUCOPIA DISTRICT.

WORK.—Cor. Oakland Transcript, March 24: Our winter here has been one of the mildest known for the last number of years; most of all kinds of business during that season continued steadily along without interruption; true, times were and now are called dull, but they can be attributed only to the general depression which pervades all communities on the Pacific coast. The depression has not been charged to the non-productiveness of our mineral resources as far as they have been developed, because it is a notorious fact that of all the mining districts

THE ENGINEER.

The Detroit Tunnel.

The project for a tunnel under the Detroit river seems to be calling out the inventive genius of the engineers and many novel propositions are made. We read in the *Engineering News* that Mr. William Scott and Mr. Henry Collins both propose tunnels in different locations, the former putting the cost at \$2,500,000, and the time two years, and the latter making his figures \$2,268,000, at which sum he offers to contract to excavate it. Mr. Hall, of Mt. Clemens, proposes to sink a boiler-plate tube, coated with tar and gravel to make it impervious to water. Mr. H. M. Cargill, of Grand Rapids, proposes to bore a tunnel with an earth auger, with appliances for removing boulders and other obstructions, working his machinery by compressed air. He estimates the cost at \$2,500,000. Mr. McWilliams, whose scheme we alluded to on February 10th, reckons the expense at \$150 per lineal foot, the tunnel to be 22 feet in diameter. Oliver Drouillard desires to sink iron tubes weighted with masonry on either side, at an estimated cost of about \$200,000. Then there is a plan for an underground hydraulic tunnel, though what that is we fail to guess. Still another ingenious inventor proposes to solve the difficulty by quite another method, that is to bridge to and from Belle Isle, and to build a canal through the island for the benefit of vessels. Mr. Luther Beecher thinks that he can tunnel underground for \$100 per foot.

Mr. John Burt, the chairman of the committee, proposes to start directly from the Michigan Central railroad depot, thence to curve to the foot of Woodward avenue, and thence to cross the river directly, making a length of 5,280 feet. This plan contemplates the construction of a double track tunnel, in caissons from 100 to 200 feet in length, across the entire bed of the river, the tunnel to be made of brick in a timber caisson, with temporary bulkheads, floated out, maneuvered by tugs and sunk in line by means of guide timbers attached to the caissons already down. When bottom is reached, access is to be had to the caissons by iron shafts, the water is to be forced out by compressed air, or to be pumped out in case the caisson has taken the bottom sufficiently to exclude the water and then the excavation is to be carried on beneath until the caisson with its included tunnel is lowered to the required depth in the trench. He proposes to run hydraulic cement into a cavity left in the brick work at the joint in order to make this portion tight. Then, finally, Mr. Coats, of Kalamazoo, has come forward with a scheme of which we have learned no particulars.

The Great Bridge Cables.

The manufacture of the wire for the great cables of the East River bridge is undertaken in the factory of J. Lloyd Hahn, the contractor, at William and Inlay streets, Brooklyn. A Pittsburg firm is under contract to furnish the steel of which the wire is made. Already the contractor has delivered ten tons of wire, but this was under an order received before the contract was executed. It will take about 22 months to draw the 6,800,000 pounds required for the cables. The steel from which the wire is made reaches the factory in the form of rods a quarter of an inch in diameter, made into coils. The coil is at once put into the hands of a smith who heats and points one end, and turns it over to the cleaners. They remove any oxide or foreign matter by dipping the coil into vats containing diluted sulphuric acid. The coil is kept in the vat until the surface of the wire is sufficiently attacked. Then, to assist the further action of the acid, a mixture of lime and water is dashed over the coils as they lie on the floor. The coils next are put into an oven to dry, preparatory to the drawing process. The draw plate is ten inches high and one inch and a half thick.

The greatest care is used in the manufacture of the plates. It is necessary that they should be of the hardest steel, and in this country generally savage steel made of pig metal is used. The French take two lateral parts of a compound bar, one part being of iron and the other of a sort of steel called *potin*, which is obtained by melting the fragments of cast iron pots to a paste with white wood charcoal and then cooling and heating the metal a dozen or more times. The iron and steel pieces are fused and hammered until their union is complete. The plate is several times heated, and then punched with punches of different sizes to secure a tapering hole from one side of the plate to the other. The draw plate is firmly fixed in a bench. There are three or four holes in each plate, conical in shape, and the smaller orifice of each is carefully finished to the size of the wire intended to be drawn through. The holes are made smaller by minute gradations, so that the reduction of the size of the wire and the effort required shall be as nearly uniform as possible in the successive drawings. If very fine wire is needed, the draw plate is made of the hardest precious stones. A silver wire 170 miles long was once drawn through a ruby. It was 0.0033 inch in diameter, and was so nearly uniform that no difference in its size could be detected either by a micrometer or by weighing equal lengths.

The wire is drawn at a bench where there are a number of heavily-built cylinders that are ro-

tated by vertical shafts under the table. Under each cylinder is a cam which acts on a pivoted lever. A chain at the end of the lever is fastened to a heavy pair of nippers or to a dog. The coil of steel is thrown over a reel ten feet from the draw plate on the floor and the pointed end of the rod is put through the largest hole in the draw plate. The workman watches his opportunity, and when the lever is free makes the dog grasp the point of the wire protruding through the plate. The cam, in the revolution of the cylinder, strikes the lever with great force. The wire is drawn through the hole for several inches, and then the nippers are made to take a fresh hold, and it is dragged through until there is enough of it to go around the cylinders, where the end of it is put in the grasp of a vice. The cylinder is put in motion and the wire is drawn out of the steel rod continuously. If it breaks in the operation, the nippers are again used. The wire required for the bridge is No. 8 gauge, or 0.165 inch in size. There are 331 strands of this wire, the full length of the bridge, made into 19 cables, which are united in the great cable. There are in all 6,289 wires in each cable. The wire is drawn twice and perhaps a third time, to reduce it to the proper size.

The contract requires the wire to be galvanized, to protect it from the salt air. This process is accomplished by passing the wire over rollers into a bath of diluted muriatic acid heavily charged with zinc. Then, to comply with the rule that the wire must be straight, with no tendency to spring back into a coiled form when unrolled, it is led a long distance by wooden sheaves to a large wooden drum, around which it is wound. The drum is of such size as to prevent the wire bending. This process of keeping the wire straight is patented by Colonel Payne, one of the Assistant Engineers of the bridge. The wire is carried a sufficient distance to allow it to cool and become set. The wire is tested in the factory by the bridge engineers. The sample is adjusted between jaws connected with a long scale arm, on which hangs heavy weights. It is stretched to test its tensile strength until a breaking point is reached. The contract requires a tensile strength of 3,400 pounds, and a stretch of three and a half per cent. So far the tests have been most satisfactory. The breaking strength of the wire has reached 4,480 pounds, and averages 4,000 pounds. It has a stretch of four per cent. The wire is bent in every direction to determine its behavior under flexional and torsional stretch.

Verdict on the Ashtabula Bridge.

The coroner's jury investigating into the Ashtabula railroad bridge disaster have agreed upon a verdict which notes several points in bridge building. They find that the fall of the bridge was the result of defects and errors made in designing, constructing and erecting it; that a great defect and one which appears in many parts of the structure, was the dependence of every member for its efficient action on the probability that all or nearly all the others would retain their position designed, and do duty for which they were designed, instead of giving to each member a positive connection with the rest which nothing but a direct rupture could sever. The members of each truss were, instead of being fastened together, raised one upon the other, as illustrated by the following particulars: The deficient cross section of portions of chords and some of the main braces, and the insufficient strength and bad arrangement of both the horizontal and vertical transverse bracing; in the construction of the angle blocks, as finally modified, without sufficient lugs or flanges to keep the ends of the main and counterbraces from slipping out of place; in the construction of the packing and yokes used in binding together the main and counter braces at the points where they crossed each other; in the shimming of the top chords to compensate the deficient length of some of their members; in the placing, during the process of erection of thick beams where the plan required thin ones, and thin ones where it required thick ones. That the railroad company used and continued to use the bridge for about 11 years, during all of which time a careful inspection, by a competent engineer, could not have failed to discover these defects. For the neglect of such careful inspection the railroad company alone is responsible. The responsibility of this fearful disaster and its consequent loss of life rests upon the railroad company, which, by its chief executive officer planned and erected this bridge.

POWER.—Man-power is the unit established by the French engineer, Morin, and is equivalent to 50 effect, the power which an ordinary man can exert during a time of eight hours' work. Therefore, the power in effects, divided by 50 gives the *man-power*. Horse-power is the unit established by Watt, and is equivalent to a force of 33,000 pounds moving with a velocity of one foot per minute, which is the same as a force of 550 pounds moving with a velocity of one foot per second, and denoted by the character *HP*.

OPENING OF A RAILWAY IN JAPAN.—In Japan the ceremony of opening a railway between Osaka and Kioto was performed on February 5th, in the presence of a large assemblage of Japanese dignitaries and most of the foreign diplomatists, which latter traveled from Tokio to Kioto by special invitation, as guests of the government.

The Sutro Tunnel.

The following descriptive article on the Sutro tunnel is from the *Gold Hill News*: In 1869 ground was first broken, at the mouth of the Sutro tunnel. For eight long years the work of running the same has been prosecuted at an average expense of \$1,000 per day. As the tunnel is rapidly nearing the Comstock and the completion of the undertaking, at an early day, is already assured, we now proceed to lay before our readers such information in regard to the progress of the great enterprise as we have been able to gain from personal observation. Of the prospective advantages to be derived from the tunnel, as regards mining operations on the Comstock, we leave our readers to judge for themselves. At the present rate of progress the header of the tunnel will reach the eastern corporate limits of Virginia inside of two months, and before the first of January, 1878, will strike the Comstock at a point 100 feet south of the Savage shaft at a depth of 1,750 feet below the surface of the mine. The rate of progress for the month of January was 388 feet and for the month of February 361 feet. The total length of the tunnel, from mouth to header, is 3 1-11 miles, approximately speaking, or 16,310 feet. The men employed in driving the header are skilled workmen, many of whom worked for years in the Hoosac tunnel, Massachusetts. They are pushing forward the work with tremendous energy, an extra stimulus being offered in the way of extra pay for all advancement made over a specified number of feet during the month. The bonus thus distributed among the miners for the month of February amounted to \$1,000. The aggregate number of men employed on each of the three hour shifts is 24.

The Drilling Machinery.

The most effective agency which within the past two or three years has revolutionized and greatly expedited the advancement of the tunnel is the drilling machine, driven by two powerful air compressing engines stationed at shaft No. 2, at present 9,000 feet distant from the header. The drill carriage, 30 feet in length and very substantially built, armed with six 12-foot Ingersoll steel-pointed octagon inch and a quarter drills, widening out two and a half inches, is rammed up to the face of the header and set to work drilling holes to the depth of eight feet, each separate drill making 300 seven-inch strokes per minute with a striking blow amounting to nearly 1,000 pounds, oftentimes twisting the drills out of shape or breaking them like pipe stems. The din of this huge engine of war hammering away at the face of the header with tremendous blows, is such as to render conversation impossible for a distance of a quarter of a mile. The time occupied in drilling the holes to the number of 12, averages about six hours, in hard rock. The harder the rock the faster the rate of progress. A jet of water shot into the holes, alongside of the drills, dislodges and drives out the drill dust. The amount of giant power consumed in 24 hours ranges from 150 to 200 pounds. Great caution is required in firing the blast, which is done by electricity, as there is danger of knocking down two or three sets of timbers if the charge is too heavy. The concussion from the blast is such as to knock a man's hat off at a distance of half a mile from the header. Immediately after the blast is fired, the valves in the compressors and reservoirs are opened and the bad air and powder driven out, about half an hour being required for this purpose. A long train of cars, to the number of twenty or more, drawn by two mules, speedily arrives, when the work of removing the waste rock commences energetically. Half an hour is required in making the trip from the header to the mouth of the tunnel, the waste rock dumped on the outside being used in forming the walls of an artificial lake. Mr. Sutro claims that when the tunnel is completed the trip can be made by steam in 12 minutes.

The Tunnel Itself

Is as straight as an arrow and is a signal triumph of engineering skill. For the entire distance from the entrance to the header it is ten feet in width and eight in height, with ample room for a double car track the whole distance. For 1,000 feet or more from the entrance it is enlarged still more, and is provided with double timbered alleyways. Where the ground passed through is found to be soft and treacherous, the sets of timbers fairly touch each other; in other places the rock is sufficiently hard to make the work of timbering unnecessary. The grade of the tunnel is three inches for each 100 feet. The present flow of water averages 130 miners' inches. The line of the tunnel passes the combination shaft of the Savage, Hale & Norcross and Chollar mining companies, at a point 200 feet north of the same.

A Subterranean Ride.

At the time of our visit to the tunnel, being desirous of making a personal inspection of the same, the "Superintendent's car" was kindly placed at our disposal—not exactly a Pullman, but a modest, low platform car, capable of accommodating two persons besides the mule driver. Divesting ourselves of our every-day apparel and donning an india-rubber coat, with overalls and gum boots, we took our seat on the ke-ar. A frisky mule by the name of "Dandy" was detailed to haul our party into the tunnel. His right eye was blindfolded as he came from the stable, but the blind was removed when he got the word to go. At the given signal he rattled off at a lively gait, and we found ourselves plunging along through the tunnel, leaving daylight rapidly behind us. Riding back-

wards, we watched the entrance daylight growing smaller and smaller until it seemed like a bright shining star; then smaller and smaller still until it assumed the dimensions of a pin-head; at the distance of two and a half miles it went out altogether. Our readers will be surprised, perhaps, to know that the curvature of the earth has something to do with this phenomenon. Of this we may have more to say hereafter. After a ride of ten minutes there was a perceptible increase in the temperature of the tunnel, which was decidedly conducive to perspiration. As we kept on we perspired more and more freely all the way to the header, although the temperature at that point is only 89° Fahrenheit. In passing into the tunnel you travel with the air current. In going out you run against it, the air being cool enough to make an overcoat acceptable. When the tunnel reaches the line of the Savage mine it is estimated that a current of air will sweep through it strong enough almost to lift a man off his feet. Up to the present time a number of heavy streaks of quartz, carrying ore, have been passed through by the tunnel, but no large body of ore. The problem of what benefit the tunnel is to become to the Comstock will be solved ere long. The successful completion of the undertaking may now be regarded as an assured fact. The moving spirit in the enterprise is

Adolph Sutro,

A man of giant constitution and indomitable enterprise. No other man, in all probability, in the face of the opposition he has encountered, could have accomplished what he has. Whether in Washington, New York, London or Paris, he is constantly supervising and directing the prosecution of the work, even to the minutest detail. His whole heart and soul is in the undertaking; in short, it is the one great work to which he has devoted his life. Mr. Sutro is sanguine that the tunnel will greatly benefit the mining interests of the Comstock. He says that when the tunnel is completed he will engage to deliver wood in Virginia at \$8 per cord, and then he can haul low grade ore to mills on the Carson for ten cents per ton. In reply to our question as to what course he would take if the mining companies refused to avail themselves of the proposed advantages of the tunnel, he replied that he would not enter into litigation with them, but that he would bulkhead the tunnel so tightly that not a drop of water from the mines should pass through it.

The Management

Of Sutro tunnel affairs is under the direction of the following named gentlemen: General Superintendent, Adolph Sutro; Assistant Superintendent and Cashier, R. S. Raw, Head Foreman, John Bluet; Foreman at shaft No. 2, Edward Biddle; Shift Bosses, Harry Bishop, John Sullivan, Robert Andrews; Foreman of the machine shop, Peter Savage; Chief Clerk in charge of store-house, Joseph T. Banks, son of Hon. Nathaniel P. Banks, of Massachusetts; Master of Transportation, Geo. Rammelkamp; Sutro's Private Secretary, Frank S. Young, a nephew of General Winfield Scott; Civil Engineers, Messrs. Brown and Hoffman; Surgeon and Physician, Doctor Bolan. One hundred and five men are employed in and about the tunnel, and some 50 mules.

From an editorial in the *News* on the same subject we extract the following:

Summing up the whole matter the following are among the merits and advantages to be accorded to the Sutro tunnel.

First.—It is the most important prospecting enterprise on the Pacific coast, as it is very liable to open up new mines east of the regular Comstock, and is even now entering upon very interesting ground where important developments may be encountered at any time.

Second.—It can be made to assist very materially in the working of the Comstock mines, as affording far better, much less expensive and more thoroughly efficient drainage than can be obtained by any other means.

Third.—It should prove beneficial in the way of ventilation in the mines, and also as a means of escape in case of fire, a cave, or other unforeseen accidents.

Fourth.—It might prove profitably available in the extraction and milling of ore from the Comstock, and especially from mines east of the lode.

Fifth.—In bringing in supplies of wood from Carson river for the mining works and mills of the Comstock at cheaper rates than rule at present. Some other advantages might be enumerated, but the foregoing are sufficient.

We have endeavored in this article to show that while not indispensable to the working and drainage of the Comstock lode, the Sutro tunnel can be made of great advantage and valuable utility in that respect. The greatest and in fact the only objection we have ever urged against the project was the "royalty" of \$2 per ton claimed by the Sutro Tunnel Co. This royalty was honestly forfeited long ago through failure to perform what the royalty was granted as a consideration for—the drainage of the mines of the Comstock. The tunnel will not be completed for several months; yet the mines have been worked for hundreds of feet below the tunnel level without any advantage or assistance whatever from the tunnel.

In conclusion: If Sutro would abandon the "royalty" proposition, cease striving for what he has not earned and does not rightfully belong to him, and depend upon the real merits of his tunnel for success, he would do well enough. Moreover, he would find the mining companies no longer antagonistical, but willing to meet him more than half way on any proposition for mutual advantage.

Nevada's Resources.

The population and wealth of Nevada bear but slight proportion to the value of her product and the extent of her resources. In the first place we are the least of all States in the Union, but in value of products in proportion to population we may claim the highest rank. These are shown by the figures of the statistician, and are proof of a wealth unequalled in any part of the known world. With a population of about 60,000, we produce annually about \$40,000,000 in gold and silver, besides other minerals, manufactures and the products of grazing and agriculture. From the great yield of our mines, this has obtained the sobriquet of the "Silver State," and well does she deserve it. From \$35,000,000 to \$40,000,000 of treasure a year for so small a population is most wonderful and should attract the attention of every one throughout Christendom who can read or hear the statement. With such production and such evidence of wealth, our slow advance in population and development is a subject of inquiry. It has been the popular custom to speak disparagingly of the State, of its sage-brush plains, its barren hills, its alkali deserts and its cold climate, constantly comparing the latter with that of California and all similar comparisons as unfair.

From this pernicious and unpatriotic custom a bad impression has been made abroad that has deterred many from seeking this for a home. Also it has been, and still is, the custom to speak of mining as but a temporary resource that is in danger of exhaustion every succeeding day. They say the State is thoroughly prospected and all parts occupied. The same was said 10 years ago; nevertheless, discouraging as the constant repetition of it is, explorations have gone on, new discoveries have been made, the production increases and a slight advance has been made in the population. From 50,000 in 1865 to 60,000 in 1875 is not such an increase as could have been expected, and by no means has it kept pace with the increased production of the precious metals. We contend that the mineral developments of the present time justify and demand, for their proper exploitation and the business consequent upon them, a population of several hundred thousand. New mines are every day discovered in some section of the State, and still there are thousands everywhere that have been but partly opened and abandoned after giving undoubted proof of great value, and, which, under different circumstances, or if in other countries, would be worked with great success and profit. In every mountain range of Eastern Nevada are silver-bearing veins, and each range constitutes a territory equal in size to the mineral regions of Devonshire and Cornwall, England, and generally of greater wealth of mineral deposits, yet either of those counties contain a larger population than our entire State. The mines have been worked for many hundred years and still give forth their treasures, and there seems to be no danger or expectation of their exhaustion. In other sections of the world are mines equally as lasting, then why should it be expected or said that the mining interest of any locality of this State can be only temporary? Nevada is a new mining country, appears to be one of the richest ever known, and it may be calculated to be as lasting.

The great Comstock ledge seems to be taken as the unit from which all must be reckoned, and if they do not come up to it they are, by the great part of mining operators, treated derisively and with neglect. It is seldom considered that if there was no Comstock ledge we would still have the richest mineral region now known. That being the first discovery and of a size and value previously unequalled, caused a concentration of energies upon it, and there the attention is still riveted. While it is worthy of its fame, we hope to call the attention of the world to the great undeveloped wealth of other sections of the State. Our own great ledge we have previously shown to be a fair rival of the Comstock, but it is so undeveloped that but few understand its grandeur and character. It is traceable for upwards of two miles in length and where explored shows a size and value not inferior to the great vein of the West. In the few years it has been worked \$40,000,000 has been taken from it, and it may be said that as yet, has been scarcely opened. Here is a field for capital and labor of the most inviting character. Here is the basis for a city as large as Virginia, and more pleasant as a place of residence; and here too we expect to see such a city. East and west of us are as important districts, containing ledges in great number and value and almost without occupants. On all hands it is conceded that White Pine mountain is a vast storehouse of base ores, but without development, and capitalists are unreasonably shy of it. The English capitalists, who through many discouraging circumstances, continued the working of the Eberhardt and Aurora, at Treasure Hill, have never had cause to regret their investment. Without doubt many of the mines in the hill will prove as valuable and that district will regain its former good name. Further east is the new district of Ward, where are a number of very large and very rich ledges, each of which claims a bonanza equal to the Con. Virginia or California. There, it is claimed by the enthusiastic mine owners, will be the great city of the State, and we hope their expectation may be gratified. There are districts too numerous to mention throughout the State where large communities would be most profitably engaged. —*Eureka Sentinel.*

USEFUL INFORMATION.

How they Raise a Ship.

The apparatus used for raising one of the heavy iron Atlantic steamers is quite extensive. A correspondent who witnessed the operation writes: Over the entire deck are massive chains, ropes as large as a man's leg, and blocks and falls that seem big and strong enough to move the whole Transatlantic Company's fleet. This network of chains and cables and blocks and falls resolves itself into five immense hawsers, that lead from the stern and the starboard quarter of *L. Amerique* far out into the sea, at the bottom of which they are anchored and held in yet firmer place by other equally large cables, also anchored, which cannot be seen at all. The first of these great hawsers is a 15-inch rope, 206 fathoms in length, and its anchor is made doubly secure by a chain of two and three-eighth inch wire, 15 fathoms long, held by an anchor weighing 4,500 pounds. The second hawser is 200 fathoms long, and is worked by the forward donkey engine. The chain attached to the anchor of this cable drags its own anchor of 4,400 pounds. The third hawser or cable is worked by an after donkey engine, and is 200 fathoms in length and 15 inches in circumference. Bent on above the 4,200-pound anchor that secures this cable is another cable equally large and nearly as long, secured by an anchor weighing two tons. The fourth and fifth cables lead direct from the stern of the steamer, and are each 160 fathoms in length. Each is strengthened by a duplicate of itself, and held by anchors weighing more than 4,000 pounds. The two hawsers leading from the vessel's stern are to pull her straight backward out of the sand she lies in, and the three great cables that are run out from the starboard quarter are to ease her gently outward toward the sea as she is dragged along. At first the cables were all run out from one side and anchored, so that they pulled more from the side than the stern, but the high walls of the sand bed in which she has settled were insurmountable. With the present arrangement, the waves that whirl past her stern keep eating out the sand ahead and open a roadway as she moves. In working, all the cables are tightened until they are stiff and straight. They are so flexible and elastic that, with a steady, even strain upon the vessel, they gradually slacken lower and lower, easing the ship along until they sway with their own weight.

TO MAKE STONE WALLS WATERPROOF.—A correspondent asks the *Journal of Chemistry* for a process which will make stone walls waterproof. What is known as Sylvester's method has been thoroughly tested, and so far as we know has proved effectual. It is said to have been applied to the walls of the gate-house of one of the New York reservoirs, and to have remained impervious to water under a head of 36 feet after a trial of six years and a half. The process is described as follows: Dissolve castile soap in water, three-fourths of a pound to the gallon; dissolve one half pound of alum in four gallons of water; both to be completely dissolved before using. The walls should be clean and dry, and the temperature of the air not below 50° (F.) when the solutions are applied. First, with a flat brush lay on the soap wash boiling hot, taking care not to form a froth on the brick-work. Let this remain 24 hours, to become dry and hard; then apply the alum wash, which may be at a temperature of 60° or 70° and allow it to remain 24 hours before repeating the soap wash. Repeat the washes alternately till the wall is impervious to water.

DEPOSITION OF STEEL ON METALLIC SURFACES.—Prof. Boettger, a pioneer in the solution of this problem, suggested for this purpose, some 30 years ago, the use of the double sulphate of iron and ammonia, as an electro-plating bath. Since that time Pro. B. has greatly improved upon his original observation, and now suggests the following procedure: He dissolves 10 grammes ferro-cyanide of potassium and 20 grammes of tartrate of sodium and potassium in 200 c. c. of water, and adds thereto a solution of sulphate of iron in 50 c. c. of water. The result of this addition is a small deposition of ferro-cyanide of iron (Prussian blue). If now a solution of caustic soda is added, drop by drop, the blue coloration entirely disappears, and a perfectly clear solution results—which is the bath employed. The deposit is affirmed to be extremely hard and durable. If the steel coating should become injured by the bending or protracted use of the plates, it can be easily removed by the use of hydrochloric acid and re-deposited.

FLUX FOR CAST STEEL.—The *Revue Industrielle* describes a flux for cast steel as follows: One of the greatest difficulties to a smith is the welding of cast steel, and this is an operation in which he rarely succeeds. A mass of ingredients and recipes are sold for the purpose of welding cast steel, but the simplest and best method is the one employed by Mr. A. Fiala, of Prague, Bohemia. He uses pulverized white marble for the purpose. The two pieces to be soldered together are heated, and after rolling the same in marble dust, promptly joined together and subjected to a good hammering. By this means we are able to weld the smallest pieces together.

Experiments Upon Cements Used in Gas-Holders.

La Compagnie du Gaz Parisien, previous to constructing some large gasometers near Paris, experimented on the different materials to be used in their construction; among others, on the cement which was to be used for the vertical walls of the reservoirs (*caves*), with the following results: The cement used was Portland cement of Pouilly, in Burgundy. It was found that a brick of pure cement six weeks old, which had been kept in water during that time, broke under a tensile strain of 170 pounds to the square inch, 12 kilos. per square centimeter; but a brick six months old, which had also been under water, broke a strain of 441 pounds per square inch, 31 kilos. per square centimeter; that cement hardens more rapidly, when exposed to the sunlight and fresh air, then when affected by humidity; but that this is at the expense of the tenacity and impermeability of the product; hence masonry walls should be sprinkled regularly until the cement is set; that the degree of fineness has an effect on the setting of cement, and consequently upon the ultimate tenacity, for it is a rule that the tenacity is in inverse proportion to the rapidity of settings; that a mortar made of two parts sand to one of cement broke under a strain of 277 pounds to the square inch, 19 kilos. per square centimeter, while a mortar of equal parts of sand and cement broke under a strain of 427 pounds to the square inch, 30 kilos. per square centimeter. The effect of sand upon the shrinkage was shown by the fact that pure cement was defaced by cracks a little more than a foot apart; when mixed with equal parts of sand, the cracks were little more than a yard apart; when three parts sand to one of cement were used, there were no cracks at all; hence it was this mixture that was used in constructing the reservoirs. —*Van Nostrand's.*

GOOD HEALTH.

Vegetable Diet.

EDITORS PRESS:—The writer has well considered the subject of sickness and health for many years past, and one of the many duties in our daily life is the question of diet, the most proper food, to promote health and longevity in the human race. And now as the question is up for discussion, allow me to join hands and state my experience:

Some 20 years since, I fell in company with gentlemen from Michigan, on a Mississippi boat, bound for St. Paul. I was attracted to the man on account of his freshness, fine health, active and youthful appearance. I did not judge him to be over 40; but when I learned that he was full 20 years above those figures, I had the curiosity to enquire of his mode of life; he informed me, that strictly, he was a vegetarian, with the exception of butter, fish and eggs, and no intoxicating drinks or other narcotics; never had a day of sickness; in fact, he was a perfect picture of health.

I came to the conclusion that whatever a person eats and drinks is done to satisfy the craving of his body, and that as edibles are applied to sustain the constituent parts of the whole system, every function is maintained from the food taken up, from the earth and the elements. It is allowed that this body is rejuvenated once in every seven years or less, that which makes up the bodily frame to-day, passes away, and within the seven years a new one supercedes the old. And supposing that by ill health, or any cause, you lose 30 pounds of flesh, and, again, in a brief period, this falling off has been more than fully restored again unto you. And during this time of gain, what was your principal diet? "Hog and hominy" is the response. Then, of course, you replace this loss by a draft upon cooked corn and hog. One-half of this new flesh is laid on from the consumption of the flesh of the swine, and here is where scrofulous and other loathsome skin diseases take their rise. The pork boils out in a natural way to relieve you from sudden death. How little thought is given to this important subject.

I would simply question the reader, who feels interested in the best method to promote long life and enjoy good health for himself, and his or her family and who is ascending the ladder of life, whether he ever paid any attention to the life and habits of swine? Have you ever witnessed their greed in gobbling up food, scattered carelessly upon a manure heap, or in a pool of filthy mud? or have seen them ravenously devouring some dead animal, which might have been as blue as a fishing-hook? at the same time, perhaps, holding your breath as you pass by, to keep off the stench. Ah! vultures could do no less. Remember those great swine shepherds, "out in the West," who have been losing their porkers by the hundreds, dying with a disease called the "hog cholera," and is it not supposable that all of these swine shepherds are suffering this dead loss to pass without some gain?

The United States Agricultural Commission reports, that in some counties—where great attention is given to the raising and fattening of swine—that 95% have died by cholera. Even if you were living upon the five per cent. saved, how could you feast upon it quietly and with a relish?

The writer who now stands at the foot of his

70th year, apparently in perfect health, claims that he has suffered but little—perhaps one per cent.—from sickness or prevailing epidemics, from his youth up. His simple and regular diet has been of a vegetable nature mostly; one-third of his food, at least, has been bread, milk and fruits. Up to 28 years of age, his living consisted most wholly upon bread and milk, with apples baked or in pies. At this age he was told that he "looked like a great baby," and he takes up this philosophical reasoning thus, that the child-like countenance was the result from living as the child lives, always eating and sleeping at regular hours, doing all his business and labor by sunlight. At 45, he carried as youthful, as healthful and fresh-looking face as others at 30 years of age. He has never been addicted to the common use of tobacco or spirituous liquors and tea or coffee.

It is very uncommon to find a vegetarian's clothing saturated with a tobacco stench, or caught unloading the filthy juice of tobacco upon others carpets and floors.

Why is not that food which comes directly fresh from the products of the earth as palatable, useful and healthful as that which is first modified by the animal creation?

Is it not a mistaken notion, that mankind must daily devour meat to bring him the strength and health to endure labor? The stomach assimilates and accommodates itself to the uses to which it is obliged to yield to satisfy the whims of its master or gormandizer.

Rice has been for ages the principal food of the Chinese. You find them generally looking hale, stout and cheerful, and they subsist upon and require less food than the average American; the cause of which may be solved in this wise: Like any person who lives mostly upon one kind of food, the demands of his stomach are satisfied and require less to satisfy his hunger; and then again, instead of scooping up his rice and forcing downwards, without proper time given to masticate, the Chinese takes up his food with a pinch, between two long sticks, and but very little at a time, which food is mixed with the gastric juices before it leaves his tongue. Nature, in this case, governs the quantity, not the "appetizer," which the epicure has to call in, as "side issues," and this is the secret of the Chinaman's "living so cheaply." They look more fat and fair than our American born people do.

If you care to live a long life, with health as an accompaniment, you will do the best to discard the flesh pots of Egypt, in the main, and choose more from the grains, fruits and vegetables. There is no grain diet more healthful than oat-meal, properly cooked and prepared. When properly served up it is delicious; and even buttermilk has its votaries, its strong, healthful, old and honored friends. Tropical fruits are good and useful in their seasons.

As a rule, those who eat the least meat and drink the least stimulants will be less troubled with the gout, ruptures and skin diseases of every nature. In fact, vegetarians usually escape fevers and other ailments, and with regular outdoor habits, are generally the longest-lived and the most happy people.

SOLOMON W. JEWETT.

Merino Farms, Kern Co., March 20th, 1877.

[There are strong points in favor of Mr. Jewett's position, and he is a grand "living example" of a life of temperance and moderation. The subject is, however, possessed of a negative which can be strongly fortified.—EDS. PRESS.]

Remedies for Phosphorus Poison.

So great use is made of phosphorus in the different industries of this coast that we have thought a list of remedies, in case anyone should take the poison into his system, would be valuable for all to preserve for reference. *The Doctor* says: The treatment of cases of phosphorus-poisoning is not very satisfactory. The stomach should be thoroughly evacuated. The best emetic appears to be sulphate of copper, inasmuch as Eulenberg, Guttmann, and Bamberger have shown that phosphorus quickly combines with the copper to form the less active phosphides. The minute particles of phosphorus adhere very closely to the mucous membrane, and can only be dislodged by chemical means. Hydrated magnesia, lime-water, liquor chlori, and chloride of lime have been recommended as oxidizers, but their action is too slow to be of any use. Turpentine appears to be the best antidote. It unites with the phosphorus to form a spermaceti-like, crystalline mass, which is soluble in ether, alcohol, and alkaline solutions, and can be eliminated unchanged by the kidneys, without injuring them. Perhaps it also promotes the oxidation of a portion.

It seems that the common commercial turpentine is the most effective, probably because it is richest in ozone from having been exposed to the air. Turpentine appears also to prevent fatty degeneration of the tissues. To repair the damage to the blood Jurgensen has employed with success transfusion, and Dr. Roussel's improved apparatus makes this operation more available than before. Schousard and Dybkowsky attribute the poisonous effects of phosphorus to its depriving the tissues of oxygen by being converted into phosphuretted hydrogen, and this into phosphoric acid at the expense of the blood, and then the tissues it feeds. The readiness with which phosphorus combines with all fatty matters renders it imperative that animal fats should be wholly excluded from the food of patients recovering from poisoning by solid phosphorus.

NEW ADVERTISEMENTS.

Notice of Assessment.—Dolores Consolidated Mining Company; Wanted, "Sawyer," N. Y.

THE PLANET VULCAN.—Professor Davidson was at the summit of the Sierras on March 21st to 23d, on the lookout for the possible transit of Vulcan over the sun's disc, reports that the weather was favorable except on the afternoon of the 21st, and late on the afternoon of the 22d, but no signs of a planet were visible, although one spot and disturbed area was seen on the 21st and 22d, and a second disturbed area appeared on the 23d. These were important as indicating what size of spot could be observed, and it is believed that had the planet appeared with a diameter of five seconds of arc it would very readily have been seen. The disc of the sun is reported to have been very sharply defined during the greater part of the time of observation. In this city Mr. Pratt of the Coast Survey made similar search for the planet; and at San Bernardino, W. G. Wright of that place, with less favorable weather, observed through the three days. The former saw the spot on the 21st and the disturbance on the 23d, and the latter saw the spot on the 21st. These observations indicate that, at the time of observation on this coast no planet was visible on the sun's disc.

The persons who committed the outrage of killing four Chinamen on Lemm's ranch at Chico, Butte county, last week, have all been arrested. There are five of them; they have confessed to the outrage and also to others which have been committed in the vicinity. They have been taken to Oroville to await the action of the Grand Jury. There is considerable excitement over the matter, and the citizens of Chico are determined to go to the bottom of it, there being a suspicion that other persons are implicated as well as those already arrested.

ALMOST the entire business portion of Humboldt Wells, Nev., was burned up on the 25th inst. The railroad depot was also burned, but the round-house was saved.

California Mines.

The California mining interests have to shoulder the blame of a good deal more than they ought to. If a mine on any part of the coast proves a failure, or the managers get up a swindling operation, no matter whether the mine itself is in Nevada, Arizona, or Idaho, the people in the Eastern States, when they hear of it, lay the whole thing to California mines. This is one very important reason why California mines are in bad repute in the East, and why it is very hard for any one to enlist the aid of Eastern capital in developing California mining property. Stock transactions also have had their effect in bringing about this state of affairs. It is of course difficult to get people who are so far away to understand the difference between one mining locality and another, or to understand the difference in mines, or the way they are managed or worked. Some of the newspapers which should know better occasionally publish paragraphs which mislead their readers in this matter. Witness the following from a late number of the *Engineering and Mining Journal* of New York, in speaking of transactions at the stock board in that city: "The California stocks are, as a rule, wisely let alone, and are thrown about among the brokers on washed sales in the endeavor to entrap some unwary outsider into parting with his money."

This is a nice reputation for the stocks of California mines to have in the largest city in the United States. It would be bad enough if it were true; but when California mines have to take an evil reputation which belongs to those of other localities, it is worse. The *Journal* probably meant when it spoke of California stocks to include all those which are called at the stock boards in this city; but the phrase is apt to convey a wrong impression, and is one which has done much harm before this to the mining interests of this State. In the same paragraph, however, it is stated that a certain Consolidated mining company, of Colorado, "has sold from \$2.50 up to \$4.00 with fair transactions, and will probably become a prominent stock." Seeing the two ideas we have quoted in the same paragraph, would lead one to suppose that all the California stocks were swindles and that the Colorado stocks were a much better investment.

Without at all intending to detract anything from the Colorado mines, it is but just to say that as between those of that State and this, the Eastern people have lost much more in Colorado mining ventures than in California. This, for the reason that being nearer at home, they invested there in preference to here; and knowing very little of the business, they went into it in an extravagant manner, and many failures were the result. Now they have gained wisdom with years, and mine more carefully, although the early experience of Colorado still has its effect on the mining interests of the new State.

As far as California stocks are concerned, it is a great mistake to suppose that there are many of them even here in the State. Most of the California mining is done by small companies or by individuals. Some of the companies are stock corporations, but very little of the stock is ever sold at the stock boards. Whenever it is sold it is a private transaction, just like any other business. It may surprise some to know that of all the long list of mines called on the San Francisco Stock and Exchange Board only twenty-two of them are California mines. It may be still more a matter of surprise to be told that these twenty-two mines have paid since they were listed the sum of \$2,651,500 in dividends, against \$962,000 in assessments, or \$1,689,500 more than expenses.

California mines are not often listed on the board—they are not favorites with brokers, and individual capitalists can make more out of them legitimately than by stock transactions; it is for these reasons that so few are on the boards. With these figures before them any one can see that the general opinion of California stocks in the East is unjust, and that the mines of the State have to bear a reputation that belongs somewhere else. It is very evident that twenty-two mines comprise a very small proportion of the thousands there are in this State, and still they are all the "California stocks" called at the board; so that even if the flings at such stocks were just and the figures given above prove them not to be, they would not prove anything against the mining industry of California.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from prominent mines have been as follows: Modoc, March 20th, \$4,345—total to date, \$42,642; Tybo Con., 17th, \$16,604.58—total to date, \$53,406.86; Con. Virginia, 21st, \$21,280.43—total to date, \$189,847.03; California, 21st, \$171,990.62—total to date, \$803,268.89; Ophir, 21st, \$7,045.26; Northern Belle, 20th, \$10,154.65; Modoc, 22d, \$8,962—total to date, \$51,604; California, 24th, \$250,695.79—total to date, \$1,053,964.68; Con. Virginia, 24th, \$42,356.80—total to date, \$232,203.83; Grand Prize, 24th, \$7,600; Tybo Con., 21st, \$10,906.37—total to date, \$64,313.23; Grand Prize, 24th, \$7,634.32; Modoc, 24th, \$4,779—total to date, \$56,383; Ophir, 26th, \$8,127.27; Arizona, 25th, \$2,083.61; Northern Belle, \$14,869.41; Con. Virginia, 27th, \$49,158.22—total to date, \$281,362.05; California, 27th, \$163,974.78—total to date, \$1,217,939.46; Manhattan, 26th, \$11,200; Grand Prize, 28th, \$5,400—total to date, \$68,684.46.

Foundry Notes.

There is not very much activity manifested in the foundry business so far this season, although it is rather early yet to expect any increase over that of the winter months. At the

Golden State Iron Works

They are making a large lot of Frue's concentrators for a company working the gold beach sands on the northern coast. These concentrators have been tried on this work and are found to answer the purpose admirably. It is expected that a much larger number will be made as soon as those now being constructed are fairly at work. The owners of the mine for which they are now being made think that this machine has solved the problem of working these sands. An illustration of this concentrator will be found elsewhere in this issue.

They have just shipped from this foundry a complete 20-stamp mill for working gold quartz at Sherman City, Idaho. They are now making 24 drying cylinders for the Sulphur Banks quicksilver mine and some quicksilver retorts for the same place. They are also making an eight-inch mining pump for a mine near Coulterville, Mariposa county, and sending off a lot of small castings to the Comstock.

The Sacramento Boiler Works,

At No. 47 Fremont street, corner of Mission, are busy on several jobs in their line. In the shop now is a new patent boiler which they think will be a first-class thing. It is the invention of Mr. E. H. Thompson of this city, and this is the first one made. It has two fire boxes, hanging one inside of the other and has about three times the heating surface of an ordinary boiler of the same size. The two fire boxes are connected with four pipes for circulation of the water at the bottom, with a combustion chamber at the top. It is claimed for this boiler that it is a great economizer of fuel. It is stated that it will raise steam in about fifteen minutes and keep up steam with about one-third of the coal used by an ordinary boiler. This boiler will be used by Mr. Miller in a grist mill in this city.

They are also making at these works a small boiler to go in a launch to be used on Clear lake. This launch is to be run by jets of water forced from its sides by the steam, against the water in which it floats; no propeller or wheel will be used. This principle has lately been tried in England with more success than when experiments were made with it formerly. The boiler in this case is quite small and is of a new type. The same firm made the boilers for the steamer *Lakeport*, which has lately been provided with new machinery and is now running on Clear lake. Messrs. Hall & Kelshaw, proprietors of these works, inform us that they design, if possible, to have completed for exhibition at the next Mechanics' fair an iron steam launch to show the people of this city that such things can be made here as well as in England. Both of the proprietors have had a great deal of experience in this line in England in the large ship yards, and desire to do something of the kind on this coast. They have no room in the shop for this work just now, but if work admits it they will start a launch and have it done in time for the Fair. They are making also at present a number of iron tanks for an oil refinery in Los Angeles county. They are busiest at present, however, making tanks for the new

Beet Sugar Mill.

This is being built for the California Sugar Manufacturing Company, an enterprise which is about ready to start up. There are 250 of these tanks to be made altogether. The largest are 8 feet by 4x4; the next size 8 feet by 4x4; and the others are smaller. The sugar mill for which these are intended is on Andrus island, beyond Sherman island on the San Joaquin side. F. A. Roe, of Oakland, is the principal owner and President of the company. Most of the other stock, we believe, is owned by farmers in the neighborhood of the mill. The farmers near by have taken a contract to furnish beets for \$4 per ton; there are 600 acres in beets on the island now. The company do not propose to raise any beets themselves but will leave that to the farmers, as the experience of other factories has proven that it costs them about \$10 per ton when the companies attempt to raise them. The mill is rather small, being of 40-ton capacity. It is a second-hand one and was originally put up in Hungary for making melon sugar. It was brought here to make that kind of sugar also, but it was impossible to get any one who understood perfectly how to run it to make melon sugar, so it has been reconstructed and turned into a beet sugar mill. Those who have hold of the enterprise now are represented to be energetic men, and mean to make a success of it if possible. They have a good Superintendent in Mr. Ortman, who was at the Sacramento Beet Sugar Works for three years. With the exception of the tanks now being made the mill is all ready for business.

On the 1650-ft level of the Consolidated Virginia mine the slacking and swelling of the ground in many places has been so great that it has been found necessary to timber in the most secure manner portions of the drift that appeared to be perfectly solid and impregnable before the current of air reached it.

The United States Mining Laws.

We are frequently asked questions concerning the changes in the mining laws of the United States, the inquirers seeming to suppose that the laws relating to mines are frequently changed. This is not so; but when any changes are made by Congress we are always careful to give the amended sections in full and explain the changes. The law of May 10th, 1872, is the mining law of the United States, all previous laws having been repealed by that. No laws affecting mines have been passed up to March 4th, 1877, since the act of May 10th, 1872, except the acts of June 6th, 1874, extending the time for labor to be done on mines located prior to the act of 1872; of February 11th, 1875, providing that money expended on a tunnel run for developing lodes, shall be considered as expended on lodes; and of May 5th, 1876, excluding Missouri and Kansas from the operation of the mining laws.

There are, however, frequently decisions of the Commissioner of the General Land Office concerning questions relating to the mining laws. Decisions are also given by the Secretary of the Interior, either confirming or reversing those rendered by the Commissioner. These decisions are considered merely explanatory of the existing laws; that is the interpretation given them by the officials before whom conflicting rights are settled. Neither the Commissioner of the Land Office nor the Secretary of the Interior have any power to change the laws passed by Congress any more than a private citizen would have. The laws themselves, like most laws, are capable of so many interpretations that the decisions of the officials referred to sometimes seem like changes of the laws. Important changes of practice are sometimes made, but no real changes in the law itself except by act of Congress.

The United States mining laws have been codified in common with all United States laws; that is the act of Congress of May 10th, 1872, has been made part of the code and is now numbered in sections in the code in a little different form than it appeared in the original act, but it has not been changed in the least, except in the instances mentioned above. We published in pamphlet form some time since these laws precisely in the form in which they appear in the code, with the proper numbers to the sections, etc. In the same pamphlet are the laws relating to coal fields, placer mines, mineral sections, etc., so that everything relating to mines and mineral lands is handy for reference, and miners need not consult lawyers to find out what the law is.

Mining Patents.

Since our last list patents have been issued for the following mining claims:

California—El Dorado county: O. D. Lombard, Mount Pleasant quartz mine. Inyo county: Hudson River M. Co., mine of same name; Wm. A. Greenly, Ignacio silver mine. Nevada county: Eureka Con. Co. Eureka copper mine; Omaha Co., Omaha mine. San Bernardino county: Heirs of Isaac Ogier, Jesus Redondo and Ramona quartz mine. Oregon placer mines—Baker county: Gadlair, Grant Co., S. C. Hollis, John Long; Jackson company, William Hoffman, J. A. Wilson. Josephine county: J. H. Reed, James Steel. Nevada—Eureka county: Jackson M. Co., Wilson and Jackson mines; A. Benedict and others, Bald Eagle lode. Nye county: Barcelona M. Co., Barcelona mine No. 1, south extension. White Pine county: Tehama Con. Co., Allen No. 2 and War Eagle lodes. Arizona—Solomon Warner, Eicantine mine; Keystone Nos. 1 and 2 G. and S. M. Co., Keystone mine.

Utah—George A. Lowe and others, Grand Chief; John A. Hughes and others, Hawkeys mine.

NICARAGUA MINES.—Robert Teats, who is mining at San Ramon, Nicaragua, has taken a 10-stamp mill from San Francisco down to the mines. The mill was to have started up the middle of last month. The ore in the mines there pays from three-quarters of an ounce to three ounces per ton in gold. In a private letter to Cincinnati, Mr. Teats says the mines are huge, there being any amount of ore, the only question being that of proper reduction works. Two of the ledges, which are traceable for three miles in length, have been worked by the natives for half a century. Timber and labor are both cheap. Mr. Teats is in 200 feet on a four-foot ledge. The Leonese mine, which is worked by a tunnel, has out 200 or 300 tons of ore, which is worth from \$15 per ton upwards. Most of these mines have been worked by arastras, and we believe the mill referred to above is the first one at the mines. We should be pleased to hear direct from Mr. Teats about this interesting mining field.

In the Hale & Norcross mine the struggle with the flow of water still continues; sometimes the pumps will get the control and the water will be rapidly lowered for several feet, then a delay in the joint operation of the Savage pumps, caused by some breakage or bad working of the machinery, will let in a flood that the Hale & Norcross pumps will not be able to keep down, and the water will again rise rapidly in the shaft. It is now held in check at a point about 22 feet below the 1900-foot station.

First Settlement and Early History of the "Eastern Slope."—No. 1.

The phrase "Eastern Slope," as formerly applied to a section of country, may be supposed to have covered a district corresponding in extent to what is now denominated Washoe, being that part of the State of Nevada comprising the counties of Douglas, Ormsby, Storey and Washoe, with the western portion of Churchill and Lyon counties. This region was so designated because of its position on and beyond the easterly slope or declivity of the Sierra Nevada mountains, and the name was retained in popular use till the discovery of the Comstock lode, when it gradually gave place to Washoe, the new mines being in the territory inhabited by the Washoe tribe of Indians. Prior to that event the people of California always spoke of this region as the "Eastern Slope." Afterwards and for several years it was universally called Washoe, which term is in turn being superseded by Nevada, the name of the State.

The First White Settlements

In this region, then a portion of Utah Territory, were made by the Mormons, a company of whom, while on their way to California in 1848, coming upon the fertile and well watered valleys that stretch along the easterly base of the Sierra, were induced to stop and make their homes there. Some of them settled at and near Genoa, then and for many years after called the Mormon station, while others took up their abodes in Jack's, Eagle, Washoe and Pleasant valleys, further north, selecting in all cases only the choicest spots for their homes. These settlers having been joined by others from Salt Lake, as many as 60 or 70 families had arrived in this part of Utah by the summer of 1857, when the greater portion of them, in obedience to a mandate from the church, abandoned their comfortable homes and made their way back across the deserts to the City of the Saints.

How they Built and Worked and Lived.

The only points at which these people settled in sufficient numbers to constitute anything like a town or even hamlet, were Genoa and Carson and Franktown, in Washoe valley; these places having been laid out with broad, regular streets and built up after the much-to-be-commended Mormon fashion. Along either side of the streets ran small ditches carrying water before the doors and upon the fields and gardens for irrigation, this being necessary to insure a crop of either grain or vegetables in that region, while with it excellent crops of both are quite certain, not only upon the alluvial soil of valleys, but also on the better class of sage lands. Water, pure and cold, is supplied here in the greatest abundance by the many streams that descend from the Sierra, which, tall and steep, lifts itself over these valleys on the west.

Nothing was here cultivated for ornament; no vines or flowers graced the houses or gardens of these Mormons. They were a thoroughly practical people. The fields and the gardens were filled only with useful products, even the door yards being planted with potatoes, squashes, turnips and the like. The houses, which were simplicity itself, stood far apart, each being surrounded by ample grounds devoted to the above uses, including a spacious corral for herding their stock.

The houses, consisting of a single story, and hardly ever containing more than one apartment, or two at most, were constructed of hewn logs, rough lumber, adobe and undressed stones laid up with mud. Windows, owing to a scarcity of glass, they did not always have, the apertures that served for such being closed by wooden shutters at night. Paint, for the same reason, was applied to but few of these dwellings, in some of which the well impacted earth was made to do duty for the usual wood flooring. Coarse and plain as their houses were the home-spun and home-made garments of these modern Ishmaelites. Their persons like their dwellings were strangers to ornament and finery. They neither cultivated nor wore nor did they ever own anything calculated to gratify the aesthetic taste. They were the most utilitarian people under the sun. From infancy nearly all had been brought up to self-denying hardship and toil. Brave, patient, ignorant, industrious, hardy and frugal, they knew only to work and to save, the luxuries and enjoyments that others consider the chief objects of life hardly entering their thoughts. They had as little sense or appreciation of the elegant and beautiful as the animals of the field. To spin and weave much and well was the pride of the girls; to perfect themselves in "bull whacking" and the use of the rifle the greatest accomplishments to which the young men aspired. The women, and the children as soon as sufficiently grown, worked in the fields, plowing, digging, hoeing and harvesting the grain the same as the men. Polite literature and the fine arts had no place in their schools nor their thoughts. To read and write was the *ultima* rule of youthful education, nor did the entire juvenile population reach even this to them advanced stage of instruction. Like their other pleasures

Their Recreations

Were few and simple, the principal of these consisted in dancing, which was practiced by all, being considered as much a religious exercise as a secular amusement. All engaged in it, the old and the young, the preacher and his congregation, the church service being generally wound up with a dance. The fiddle was their favorite instrument of music, and was played with a vigor that made up, in the estimation of those entertained, what might be lacking in artistic skill.

An Epoch in their History.

And so they lived on, these simple people, in their isolated homes, until 1857, when, fearing some great curse threatened to the outside world, they disposed of their lands and other property for what little they could get, and the greater part of these deluded people left for Salt Lake. Here they remained till the time fixed for the impending evil had passed, when the most of them returned to their former homes to find them in the possession of others and themselves forced to take up with such poorer localities as were still to be had.

The Miners Come In.

As early as the fall of 1849, a few of the overland emigrants bound for California stopped and remained permanently in this part of Utah, a company while camped on Carson river near the mouth of Gold canyon having discovered on an extensive bar formed at that point such prospects of gold as induced them to stop and go to work there. As very good wages could be made there these emigrants were afterwards joined by a few others, all of them remaining on the bar over winter. Every year after that, between some small parties who went over from California and such additions as were made to the population by the incoming emigration, the number of the miners was considerably increased, there having been as many as 200 or 300 at work along Gold canyon at one time. Among others who went over to that region from this side were a company of Chinese, num-

The Mountain Meadows Massacre.

One of the events of the past week has been the execution of John D. Lee, in Utah, for his share in the brutal massacre of a train of emigrants which was crossing the plains for California in 1857. The incident calls to mind, not only the terrible crime which was perpetrated on the Mountain Meadows, but brings up a thought of the many hardships and deaths which were almost milestones on that overland trail which the early comers followed. Many of the emigrants were attacked by Indians along the road, and sometimes a whole train would be swept away by the fierce aborigines. The worst of all these occurrences was the terrible Mountain Meadows massacre, which occurred in Utah, twenty years ago. It was all the more horrible because it was participated in by white men, who, under the guise of friendship, treacherously turned the poor emigrants over to the Indians, whom they had previously told their plan, and then joined the red-skins in the brutal murders which took place. The following description of this terrible outrage was written from the testimony brought out at the trial of Lee:

In the summer of 1857, a train of emigrants, hailing from Arkansas, and bound for California, entered Salt Lake City. It was a wealthy and populous train. There were in it 150 persons, men, women and children, 400 head of cattle and 70 or 80 fine horses.

Suddenly at daybreak Monday morning, September 7th, 1857, the emigrants were attacked, and at the first fire seven were killed and 15 wounded. Unprepared, and, while most of them were yet asleep, they fell helplessly before the bullets of their unseen foes. With a promptitude unparalleled in the history of Indian warfare, these emigrants wheeled their wagons into an oblong corral, and with shovels and picks threw the earth from the center of the corral against the wagon wheels. In an incredibly short time they had an excellent barricade. So rapid was their work that the plans of the assassins were turned.

and cut their throats from ear to ear. It is the most heartless, cold-blooded deed that ever disgraced the pages of history. The cowardly assassins could not have performed one single act that would have added to the blackness of their perfidy. They feigned friendship and sympathy, they induced these brave men to lay aside every weapon, and then shot them down like dogs. The venerable gray-headed clergymen, the sturdy farmers, the stalwart young men and the beardless youths, all were cut down, and above their dead bodies waved the stars and stripes.

The Execution of Lee.

The execution of Lee occurred on Friday morning, March 23d, on the spot where the massacre occurred. Arrived within a few yards of the monument, which is shown in the engraving on this page, and which was a huge irregular pile of stones, whereon the cross stood erected to the memory of the butchered emigrants and which the Mormons subsequently tore down and defaced, the Government wagons were placed in line together, and the six men who had been selected for the execution were posted, armed with needle-guns. Lee came forward. After allowing the prisoner to say his last words, Marshal Nelson partly faced the condemned and gave the word "ready!" The guns were dropped. "Take aim!" The guns were leveled on the victim. Then after a silence which seemed an age of duration to the bystanders, the word "fire!" rang fatally on the air. Six simultaneous reports followed and John D. Lee fell backward on his coffin, his feet remaining on the ground. There was no quiver or struggle. Five balls had passed through his body in the region of the heart.

Mechanical Ore Concentration and Separation—No 27.

[Written for the Press by FRANCIS M. F. CAZIN, M. E., Santa Fe, New Mexico.]

The Old Plashen-Hearth.

Of which Bruntner's wash table is a mere imitation, consists of an endless belt (india rubber)

Passing as an inclined plane from below to above, being fed at a proper point with a thin coat of ore-pulp, and above such point with a thin stream of water. The heavier parts are then carried beyond the upper edge and washed from the belt when it submerges below the inclined plane. The lighter parts (waste,) flow with the water over the lower edge. I abstain from closer description because all the essential features of this apparatus are preserved in

Frue's Percussion Plashen-Hearth.

Frue's table was mentioned in Vol. XXXI, No. 4, of this journal, and has since found its way into practice. It is a combination of the old plashen-hearth with the percussion table principle, and a lucky and ingenious combination, without doubt. A good rubber belt, about four feet broad, constantly shaken from side to side with a regular slow motion, is the principal feature of the machine. This belt is about twenty-seven feet long, and has projecting flanges of elastic rubber along its outer edges, to keep the sand and water from splashing over. The progressive motion is communicated to the belt by a driving drum, which is connected by a small rubber belt to the front end roller, thus enabling the apron to be run more loosely and with less strain than if only driven by the drum. The driving drum dips into a tank of water through which the endless apron travels in passing around. On leaving the water tank the belt passes over the tightener and guiding roller.

The ore sized by the described second mode, where the waste is present in larger size than the valuable material, being shaken with a small amount of water will divide evenly on the inclined plane, and the heavier and smaller ore particles will resist the down-flowing water sufficiently to be carried along by the belt over the upper edge into the water tank below; and the waste (lighter and larger particles,) will pass over the lower edge. It is successful only on material classified in funnel boxes and of the size of one-half millimeter or less. That some kinds of slimes require to be passed over the apparatus twice or three times before being exhausted of their valuable parts, should not prevent a recognition of the true merits of the apparatus, as its capacity is, notwithstanding, as great as that of any other apparatus constructed for the same purpose.

LAST week, says the Yreka Union, the Joseph Corry company, while ground sluicing, found a piece of gold in their claim weighing 10 pounds, and worth \$2,000. It contains a small quantity of quartz—experts say about eight or ten ounces. The claim in which it was found is located on McBride's gulch, a short distance north of Hawkinsville. It was found about two feet above the bedrock.

IN the Ophir mine a strong flow of water was struck in the bottom of the main incline a week ago, and the sinking temporarily suspended until the pumps can be put in working order in the incline below the 1600-foot level. That is being done as fast as the work can be accomplished.

FRUE'S CONCENTRATING PERCUSSION TABLE.

bering in all some 50 or 60, the most of whom settled at Chinatown; hence the name of that place, since changed to Dayton. A few of these Mongols also settled at Johnstown, two miles further up the canyon, a name also derived from the presence of these people.

Along about 1858 the number of miners on Gold canyon began to diminish, owing to a partial exhaustion of the diggings, which, by the time the Comstock lode was discovered, were pretty well worked out, that event putting an entire stop to further operations of this kind. For several years at first these diggings yielded on an average about an ounce per day to the man, the dust here obtained being worth only about \$12 per ounce, owing to its being so largely alloyed with silver. Afterwards the daily earnings here declined, their average towards the last not amounting to over half an ounce and finally not even that much.

As early as the summer of 1850 parties from California had been in the habit of going over the Sierra Nevada for the purpose of meeting the incoming immigration, and supplying them with provisions, exchanging the same for stock; many of the animals, by the time they had reached Carson valley, where the most of these traders met the immigrants, having become so poor and weak that they could go no further. In this strait the owners being glad to part with them for a small consideration, the sharp Californians were enabled to get many a good bargain, since, after resting and recruiting them for a few weeks, they were driven into the farming and mining districts west of the mountains, where they were in demand at high prices.

Finding these valleys of western Utah good places for settlement, especially after the vacancies created by the departure of the Mormons, quite a good many of these speculators and traders took up their quarters permanently there, their number having amounted to several hundred by the time the mines were discovered. Joining with the other Gentiles, as the Mormons styled all persons not belonging to their church, these farmers and stock raisers constituted an element antagonistic to these religious bigots, the differences between these two classes having at length culminated in many bitter feuds, some of which were attended with violence and bloodshed; a state of affairs that did not wholly cease until the summer of 1861, when the act organizing this portion of Utah into the Territory of Nevada having gone into effect, the offices, with full political control, passed into the hands of the Gentiles.

They were too strongly fortified to be attacked again without loss of life. The plan resolved upon was to decoy the emigrants out under a white flag protection, and the plea that it was necessary to save them from the Indians. But all this recruiting had taken time, and the emigrants held their ground all the week. Their camp was in a hollow overlooked by low hills, and from there and from behind stone breastworks Lee and his men kept them under constant fire, killing the cattle, wounding and killing emigrants and making the corral a veritable death pen.

Meanwhile the decoy plan at the camp was put into effect. A white flag was displayed,

Monument at Mountain Meadows.

and Lee marched under its cover and met an envoy from the beleaguered camp. He promised the emigrants protection if they would lay down their arms and march out. They could do nothing else, and acquiesced. The arms, the wounded and the children were put into two wagons, driven by Mormons; behind them came the women, marching in single file, and a little back of them came the men, unarmed, starving, many wounded, and utterly despondent. On went the mournful procession. Lee marched between the two wagons. Suddenly he brought his gun to his shoulder and fired at a woman in the forward wagon, killing her instantly. It was the signal for the massacre. Indians rose from behind bushes, painted Mormons stepped from behind concealments, and all along the line the men and women were shot down like cattle in the shambles, while Lee and his aids dragged women and youths from the wagons

A New River Mining Machine.

Some weeks ago, says the Oroville Mercury, we gave a description of the new mining machine built by Messrs. B. Hedge and J. N. Walker, of Augusta, Maine, and at work in Feather river, near the town of Oroville. That description went broadcast over the land, and hundreds of the best miners in the State flocked here to see it work. They examined it carefully and well, and all went away satisfied that it will do more than ever claimed for it. It now lies just below town, in the river, near the north bank, at work on Parks Bros. & Shaeffer's ground. People are constantly going down to see it work. The people of Oroville have all seen it, and thoroughly understand the principle on which it works. Now, people from a distance are coming daily, and they are completely astonished at the simplicity of the thing. It is upon the very same principle that the infant draws its nourishment, the smoker the sweet fragrance of the Havana. Each creates a vacuum, and the milk in the one case, and the smoke in the other, makes haste to fill it. So here, a vacuum is formed in the upper part of the cylinder, and up flies the earth to fill it. If the lower end of the cylinder is on the bed of the river, the earth, gravel and stones, even of the size of a water bucket, rush to the top of the cylinder like shot out of a gun, to fill the vacuum produced by condensing the steam in that part of it. But we will again tell our readers of its manner of working, and our statement is absolutely correct in every particular, as hundreds of men can affirm. In our other report some inaccuracies occurred, owing to the fact that we wrote without knowing the measurements of the boat, etc.

The boat is 90 feet in length and 20 in width. The deck is probably three feet above the surface of the water. On this deck is a house in which the workmen eat and sleep, a 12-horse power steam engine which hoists and lowers the cylinder by means of pulleys fixed to a common derrick, and a lot of such implements as are needed for every day use. By the side of the boat, and affixed to its deck, is a common mining flume, 100 feet in length and 20 inches in width, provided with the same blocks and apparatus for catching gold as any other flume. At the upper end is a pump worked by steam that pours a constant stream of 100 inches, miners' measure, of water into the flume. Now, suppose a fire is built and steam got up and the machinery set to work. The first seen is the 100-inch stream of water pouring into the sluice; then the long arm of the derrick lowers until the cylinder hanging from the end of it by a bale, the same as any common kettle has, rests on the bottom of the river. The engineer, by turning a faucet, sends the steam into the upper part of the cylinder (the lower end of course being filled with water which stands inside nearly as high as the outside) until the air is displaced; this is instantly followed by a deluge of cold water which condenses the steam, and then up comes the bed of the river immediately below the bottom of the cylinder, to the amount of from one to three tons. Next up rises the long derrick arm, bringing with it the cylinder, with its load of earth, stones and gold, and swinging around to the sluices into which it is discharged, and is washed away by the 100 inches of water that are constantly running. It takes a minute and a half to do all this, that is, from the time the arm of the derrick begins to lower until it again reaches the same position. The amount of earth taken up is from one to three tons. If they had a 25-horse power engine they could easily haul up five tons. As it is now the lifting capacity of the engine is their limit. A day's work of ten hours, so far, has been to bring up and wash 300 tons. More could be brought up, but no more can be washed in the present sluices with the amount of water used. They have been at work in water running from six to 16 feet in depth. Of course the depth of water makes no difference, only that the deeper it is the longer must be the cylinder. Will not the machine revolutionize river mining? There is no longer any need of drying the river. In fact it can be mined best when the water is in its bed. The gravel is so thoroughly pulverized that all the gold is washed in a very short sluice. No longer any difficulties exist about dumps or tale races. Turn the lower end of the boat a little and you have all the dump you need for a time, and another change will give you more. With an engine and derrick on the shore, the bed of the river can be mined as far as the arm of the derrick will reach. A few days ago Mr. Hedge found a new piece of gravel that it became necessary to remove. But little water was flowing over it. It consisted of boulders as large as a water bucket, gravel and cement from the mining claims above. Picks and bars were tried in vain upon this substance. It seemed to be almost as hard as asphaltum. The cylinder was lowered upon it, a vacuum produced, and up came this hard substance to the depth of 18 inches, thoroughly pulverized. A large number of these machines will be put upon the river as soon as they can be made. A number will also be set at work in the lava beds. It will be recollected that the Chinamen were always driven out by water after reaching such a depth, and just when the richest streaks of earth were found. This same water is just what is wanted to aid this new machine in working a lower strata here.

The Dangers of the Town.

Much has been written about the condition of the agricultural laborer in this State. We do not deny that in some respects it is hard, as a general rule, and that some things which are his customary prerogatives in the older States are not given him here, but on the other hand there is the superior opportunity which he enjoys here of getting a start for himself if he be wise and saves his wages. It is not the general subject which we design to discuss at this time. We rather would say a word to the young men who are now working for wages on the farm and whose future for good or evil depends altogether upon the acts of the next few years.

So far as our observation goes the earnest young man who is true to the interests of his employer meets with as much encouragement in California as in any other State. Being a young man ourself we have taken occasion to speak to many farmers who have favored us with visits, asking them what they thought the chance was for a young man to build up in their service. They have all answered with one accord: "I am disposed to help a young man if he be true to my interests and to his own. I like to see the young men grow up to do well. I like to see them save their money, for I know they can soon be owners of their own homes if they will do it. I give them my papers to read and help them all I can. But there is one thing which ruins young men and that is the desire to waste their substance in the towns. Here they lose their money, their health, their ambition and the next step is to become one of the army of blanket strappers who work during harvest and wander the balance of the year."

This is just the point which we wish to enforce at this time. The young man who has a chance to hire out for the year, say for \$300, can save \$200 of it and still have all a moderate desire will call for. If he have the genius of saving and can enjoy the satisfaction which every step toward being his own master gives such a one, he can save more than the amount we have named. At the beginning of the second year if his master is doing well he can increase his wages by \$50 or more and without any great deprivation of himself he can have \$500 in ready cash for his two years' work. If to his spirit of economy he adds fair business sagacity, he can get a start for himself with this amount. Mr. J. C. Smith, of Sutter county, who made us a call last week told us of a case of this kind which occurred within his own experience. A young German worked for him for two years and saved about the amount we have named. He then went to work for a neighbor by the year and took his pay in horses and farm tools. At the end of the third year there was a ranch for sale cheap in the neighborhood and the young man bought it, paying down what he had saved and having his horses and tools to begin with. This young man began in 1864, coming fresh from the old country and having none of the advantages which most young Americans possess. The last time Mr. Smith saw him he had his ranch paid for and \$7,000 in the bank. There was nothing peculiar in this young man's method except his desire to save his money and his resolute turning from those influences which destroy our young laboring men. He cared nothing for the allurements of the town. He rode to the village with his employer and was always ready to return with him. He saved his money and he saved himself.

Mr. Smith has had cases of directly the opposite character during his experience as an employer. He had one bright young man, for instance, who began his year well and worked until harvest time, then when harvest hands were getting twice his wages he deserted. He soon became associated with "certain lewd fellows of the baser sort." He passed his nights and Sundays in carousals in the town. He lost his self-respect; his health gave way to shameful diseases and he sank to utter worthlessness.

These two cases are real as the life of the two young men. There is nothing uncommon about them. Both experiences are repeated many times within the observation of many of our readers we doubt not. Are words necessary to enforce the lessons which the cases teach? If so let us make them brief: First, stick to steady employment, because its rewards are always accruing and because no time is at hand for the demons which rule in idleness. Second, hold yourself above the waste of money and of health which nights and Sundays of town dissipation will certainly demand from you. Third, begin at once to lay up capital by the zealous saving of your earnings. Hundreds of young men are doing this on our farms to-day and thousands more ought to be doing it. The way is open. The State demands thousands of good citizens of the kind which these young men can make of themselves if they will. What young man who reads this article will begin at once and enter upon a career which will ensure him a home of his own and the respect of his fellow-men?—*Pacific Rural Press.*

"TESTING ORES."—A. B. Roberts, of Boise City, says: "am very much pleased with Chas. H. Aaron's work on 'Testing and Working of Silver Ores.' It will be the cause of new life and great advancement in silver ore prospecting if miners and prospectors would procure a copy and put in their pockets when they start for the mountains."

THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at \$8.	\$12.00
Two firemen at \$4.	8.00
1,500 lbs of salt at 1 1/2c.	22.50
Wear of shoes and power.	1.50

Cost for 15 tons.	\$44.00
Cost for one ton.	2.93 1/3

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

ARITHMETIC MADE EASY.

ROPP'S

EASY CALCULATOR

Is a new publication that must prove of incalculable benefit to Farmers, Mechanics and Business Men. It is so rapid and original as to startle the most scholarly, and yet so simple and practical that the most illiterate in figures can instantaneously become his own accountant. It enables thousands to accomplish in a minute what they could not learn to calculate in many months.

The first part contains an entirely new system of tables, which show at a glance the exact value of all kinds of Grain, Stock, Hay, Coal, Lumber, Merchandise, etc., from one pound up to a car load, and for any price that the market is likely to reach; the interest on any sum for any time at 6, 7, 8 and 10 per cent.; correct measurement of all kinds of Lumber, Saw Logs, Cisterns, Tanks, Grainaries, Bins, Wagon Beds, Corn Crib; a Time, Wages and many other valuable tables.

The second part is a practical arithmetic, and embodies a simple mathematical principle which enables any one familiar with the fundamental rules to become a lightning calculator; and by which over two-thirds of the figures and labor required by the ordinary methods, and fractions with their intricacies, are entirely avoided.

The work is nicely printed on fine tinted paper, is well and elegantly bound in pocket-book shape and is accompanied by a Silicate Slate, Memorandum and Pocket for papers. It is by far the most complete, comprehensive and convenient pocket manual ever published.

Price, bound in Fine English Cloth, \$1.00.

Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter, or receipted by express. Address

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

Continued from page 197.

which have been opened up in Nevada, this and Tuscarora, 25 miles from here, are the only ones which have produced mines that have paid from the beginning. This fact has been demonstrated in this district by the results obtained by the workings of the celebrated Leopard mine, which you often hear about. Their mill has been in continuous operation all winter and there is no prospect of its shutting down only temporarily for repairs during the coming season. At the mine there are now working about 100 miners, who ought to get out ore enough to supply their 20-stamp mill. Of the other mines in this district, some have worked all winter. The Hussey keeps up its progress and are now working down to the depth of 500 feet. I think they are not extracting much ore, the work done there being mostly of a prospecting nature. They have no mill, but some of their ore worked this winter at the Leopard mill yielded handsomely, I believe about \$220 per ton. There has been continuous work done all winter on the O. K., and there is every indication that it will be one of the best mines in the district. The Panther and Fisher are being worked with every prospect of their turning out well. All these mines which I have mentioned, also the South Leopard, are in the vicinity on the same range, and contiguous to the Alameda. There is no reason in the world why, if the last named mine or location was developed, would not prove as good as the Leopard.

Arizona.

VULTURE—*Arizona Miner*, March 16: Work is being pushed forward on the Vulture mine most successfully, the latest development being the striking of a rich lead north of the front vein, the ore averaging over \$60 per ton. They are now crushing 18 to 20 tons per day. Thirteen tons of ore from the Tip Top mine, in Humburg district, yielded the highest value of \$4.00. Mr. P. W. Smith started from Wickenburg to San Francisco the other day with \$7,000 worth of silver bullion from Humburg district, and about \$15,000 worth of bullion from the Vulture.

MINERAL PARK—The mill at this place is well supplied with ore from the Keystone, Lone Star and other mines, and the amount of bullion which will be forwarded from the Park will be immense. The Index, La Porte, Lone Star, Keystone and various other mines in this vicinity are developing well.

Idaho.

THE MINES—*Idaho Avalanche*, March 24: The mining outlook continues to be regarded as favorable. From all sections of the Territory there are reports of promising developments in the mines, and the operations in quartz the coming season will undoubtedly be on a larger scale than those of the past. In Owyhee it is generally conceded that we have got down to low water mark. Business will steadily improve as the season advances. The great want is outside capital. Good management, prompt payment of workingsmen and an honest development of our mines would pave the way for a new era in mining operations here. The dawn of a brighter day is not far distant.

GOLDEN CHARIOT—The developments at the 1300-ft level continue to be the great central point of interest in the mine and the progress of work there is characterized by a continuance of the most favorable indications. The water is increasing, and the quantity removed from the mine daily exceeds 100,000 gallons. The ledge continues to improve and there are unmistakable evidences of a large ore body in the vicinity. The work on the level has now progressed inward a distance of about 240 feet. At a distance of 60 feet further, which will be reached some time in April, the work will be directly under what is known as the Linkton shute, and several hundred feet further down than that of any point previously worked in that section of the mine. Abundance of rich ore will be taken from that point in a short time, and the bullion product of the mine for the coming summer will, it is confidently believed, be equal to the yield of the Chariot in its palmy days. The machinery of the Golden Chariot mill is being renovated, repaired and put in thorough condition.

POORMAN—The shaft is down about 700 feet, and the bullion products of the mine since the period of its discovery, amounting to little less than three million dollars, afford a guarantee of the richness of the ledge, while the past development furnishes indications that the vein increases in richness as it goes down, and must, under judicious management, yield a greater amount of treasure than has ever been produced from this mine before.

BELLE PECK—The main shaft has been completed and tunnels have been started both north and south. Stoping will commence next week. There is abundance of good rock in sight, and Mr. Peck anticipates that the bullion yield of the coming season will be much larger than ever.

There is a splendid ledge in the Folsom, and a handsome yield of treasure is expected the coming season.

The Douglas mine, near town, is said to be exhibiting marvelous wealth. The rock has been getting richer and richer for several weeks.

The South Chariot, it is rumored, will be worked on a large scale in a few weeks.

Montana.

ELKHORN DISTRICT—*Butte Miner*, March 13: A new six-stamp mill is at once to be erected at the Elkhorn mine, a hopper, Elkhorn district, about 30 miles west of Bannack. The mill is intended for the reduction of silver-bearing quartz, by wet crushing. A supply of ore will be obtained from the Storm lode. This mine has been quite well developed and shows a large body of ore which is free from bases and yields on an average 80 ounces of silver to the ton. Business is dull about Bannack at present, but it is expected that when the season opens work will be prosecuted on all the mines in the locality.

BULLION—A shipment of crude bullion, valued at \$5,000, was made to-day from the Davis mill to the Helena assay office. The returns from the former shipment received from the assay office show a larger percentage of gold in the bullion than was previously estimated, as it contained 47½% of gold. This is a heavy yield of gold and is very encouraging to the Lexington mine.

The Centennial mill has just completed a run upon a small lot of ore from the Walker Bros. claim, on the Rainbow. The high grade character of the ores taken from the Rainbow lode has been fully established by the reduction of several tons taken from various mines along the vein. Messrs. McKinn & Co. are now having 20 tons of ore from the Rainbow crushed at the Centennial mill.

Messrs. Donnellie Clark & Larrabee purchased last week and will ship East in a few days 50 tons of copper ore, which is the best by a small amount of any heretofore taken from this mine. The Parks mine has the deepest shaft upon it of any in the camp, and the ore has continued to improve in sinking, until it is now found to contain more than one-half of its weight in copper.

Utah.

LEEDS—*Cor. Salt Lake Tribune*, March 20: Silver Reef is about two miles from Leeds, and is a flourishing mining camp. It has about 100 houses, and about 1,000 inhabitants. Three months ago this place was covered with sage brush and granite boulders, but now life and activity are visible on every hand. The ledges in this district are of a most promising character. The ore averages from \$1 to \$500 per ton silver, and some has been known to go as high as \$16,000 to \$20,000 per ton. The great want of this camp have been mills to mill the ore which is lying on the dumps in large quantities, but we think this difficulty will soon be overcome. The Leeds M. Co. has started their 10-stamp mill, and are turning out about \$2,000 worth of bullion per day. This mine works about 60 men. Two miles south on the same ledge, the Harrisburg M. Co. have incorporated a very valuable mine. Two miles southeast of Leeds, on the Grapevine Pass, things are looking away up. The Toquerville S. M. Co. has incorporated a rich mine on the Morning Star reef. There have been large quantities of rich ore shipped from this mine. Close to this mine there is a large spring of water, and there is also a town site located here. Within a few hundred feet is a 20-stamp mill in course of erection, which, when completed, will considerably increase this valuable mining property.

Curious Ore.

A few months since we published in the PRESS an item clipped from the *Arizona Miner*, headed A Queer Discovery, giving a statement of the discovery of a vein of micaceous iron, carrying silver and gold in paying quantities, with the assays of the same. During the winter the Sumner company have been working the vein, and a careful statement of what has been done is published in the *Miner*. A correspondent of ours in Arizona has sent us a piece of the ore, which assayers and mining men consider an anomaly; the specimen is from the pay streak of the mine. It has had both ends broken off, and was burned in a blacksmith's forge, causing the silver to show freely. The mine from which it came is better known as the plumbago, stove-polish or micaceous iron mine, than by its proper name—the Sumner. It is about 15 miles from Prescott, on the very head of the east fork of the Hassayampa. Messrs. Deroche and Bigelow have been working on the mine for two months past and have run an open cut into the vein, to cross-cut it at right-angles, 50 odd feet in length, the last 26 feet being in the vein, five feet wide and 24 feet deep, and they have not yet reached the hanging wall of the ledge. The whole of the vein matter is permeated with streaks and threads of the mineral, all carrying more or less gold and silver, which all run into one well defined pay streak, which is encased in soft, green soapstone, and varies in thickness from the surface to the bottom of the cut mentioned from two to 11 inches—the thickest portion of the ore being the richest.

The surface ore ran as high as \$800 per ton in gold and \$1,500 in silver. The *Miner* now gives the following assays from average samples of the ore as assayed on the dump, calculated per ton:

No. 1. Silver, \$290.57; traces of gold. No. 2. Silver, \$122.51; gold, \$1.25. No. 3. Silver, \$72.90; gold, \$5.02. No. 4. Silver, \$43.95; no gold. No. 4. Silver, \$4.70. No. 6. Silver, \$3.14.

The above assays were from Mr. Blake, the Nos. 5 and 6 being ore taken from the threads mentioned outside of the pay streak, and the four first from the ore stacked up for reduction, as are the two following by Mr. Kelley:

No. 1. Silver, \$113.13. No. 2. Silver, \$181. A choice lot of ore was sent to the Pinal company's smelting works, at Walnut Grove, from which Mr. George T. Hogle made an assay, which yielded in silver \$2,252, gold \$25; total, \$2,277, which is the highest we have heard of from this very peculiar ore.

Tests made have proven that the ore is not milling, and the nearest smelting works are 30 miles from the mine; the charge for smelting being \$75 per ton. The specimen which was sent us we have at the editorial rooms of the PRESS, where it may be seen by any one desiring to examine it. Some of the ore is being examined by Mr. Henry G. Hanks, and as soon as the analysis is completed we shall publish it. It is more than likely that the mineral is new.

Drift Mining.

In our last we gave an article from the Nevada Transcript on the above subject, and now take the following from the same source: It does seem to us that this is the direction and here the opportunity for capital to invest with a certainty of success. The more shallow and easily developed parts of the channel are already worked, but there are yet miles and miles of the same material undisturbed. In many places it is covered with lava and pipe clay, too deep for profitable hydraulic mining; and for the want of capital (with the exception of a few instances) to open out and drift, it has remained all these years untouched, when the ground is positively known to be very rich. A few years ago we knew nothing of drift mining, but still these mines were worked with great profit. Now, with improved machinery, 20 years of experience and the aid of a little capital this can be made the most certain and profitable mining of any in the State. Most of these miners are, as a rule, unable to reach capital. We are pleased to know, however, that we have some men of means and enterprise in this country, who are now commencing operations on a large scale. From the character, energy and long mining experience of these men, we shall expect to see the work pushed forward with all the vim characteristic of these gentlemen. Their location is on the channel between North Bloomfield and Moore's Flat. We feel that their success is already assured.

The Moore's Flat blue gravel mining company are steadily and energetically pushing their work forward. The drain tunnel to the main shaft, which will conduct the surface water, is now more than half completed. The main shaft has been sunk 100 feet, and finding too much surface water to contend with, they were forced to stop the sinking and complete the drain tunnel, which they are running day and night. All of their machinery is in place and, as soon as the surface water has been drained, sinking will be resumed with vigor, so that the bedrock will be reached by the first of June. Then we expect to hear of large results, as that portion of the channel is known to be very rich. The Moore's Flat company have as fine ground as there is in the State. Their location is convenient, with plenty of wood and water for

economical working. The ability displayed in the management and the perseverance in overcoming every obstacle has given the community confidence in the company's final success. The Bald Mountain mining company have just cleaned up their dump of gravel which had accumulated during the dry weather, and taken over \$200,000 in gold out of it. They have over 150 men drifting in the mine. They are in on the channel about one mile, and have a small locomotive to draw the gravel out. The locomotive has proven to be very efficient. The mine is in splendid shape, and we look for large returns from there this year.

The North Bloomfield hydraulic mining company have just made their monthly clean-up. From the quantity of gold in the sluices, it must have been large, although we do not know the exact amount. This company has a very large claim, and it is now well opened and in good condition for work. We presume that they will clean up not less than \$800,000 this year. We are pleased to note the recent purchase of hydraulic property on the channel at Hunt's hill, by San Francisco and Eastern capitalists. From our knowledge of the ground they have made a good selection.

Coast Railroad Items.

The Southern Pacific railroad is advancing very rapidly. It is stated on the authority of Governor Stanford himself, that the Southern Pacific railway managers have made arrangements to build 140 miles of road across the Colorado, into Arizona, before the next regular session of Congress. The company are empowered to do this under the general law passed at the last session of that body. This will have the effect of inducing rapid immigration to Arizona, and will effectually open up that country, where there is probably some of the best mineral ground in the United States.

The Northern Pacific is just now engaging the energies of the Central Pacific Railroad Company. This branch railroad is to connect Oakland and (by ferry) San Francisco with Bantast station and the main line, and so shorten the time and distance to Sacramento and the midland and southern counties. It will skirt the bay, penetrate some of the most isolated but pleasant towns in Contra Costa, turn Mt. Diablo upon its northern flank, and tap the coal mines near Antioch. It will tap the San Ramon and other rich valleys opening on San Francisco, San Pablo and Suisun bays, and ought to be, from its local traffic, a paying concern. It is said, too, that it will shorten the time by the way of Stockton to Sacramento by three hours; for, in addition to the great distance saved, it will avoid the heavy grade through the Diablo range, and run over comparatively level ground. Should this shortage of time be realized, the new route will take San Francisco passengers to the State capital more than an hour quicker than the average passage by way of Vallejo. The road is being built around the bay rapidly, and the men we believe are at work at San Pablo laying track.

The San Francisco and North Pacific Railroad Company have agreed to put in a branch track from the road, to terminate at or near White Sulphur Springs.

The contract for building the narrow-gauge railroad bridge across the Russian river, at Moscow, has been let to Martin & Co. for \$35,000. The contractors gave bonds to have the work completed so that trains may pass over it on or before the 1st of June.

In January and February of this year the Central Pacific railroad earned in gross the sum of \$2,076,000. This is largely in excess of its earnings for the corresponding period of any previous year of its existence. But the through freight for the East this year was only 6,751,000 pounds, against 10,208,300 pounds last year, and larger quantities in each of the preceding years.

County Assessor Burroughs, of San Diego, has received the statement of the assessable property of the Southern Pacific railroad for San Diego county. According to this statement, there are 100 15-100 miles of the road completed in San Diego county, valued at \$400,600.50. The pro rata of rolling stock for San Diego county is \$105,941.70. Improvements, \$4,000; personal property, \$1,000; making an aggregate of \$511,541, or about \$5,015.40 per mile.

Meetings and Elections.

AMERICAN FLAG M. Co.—March 23d. Directors—L. S. Adams, Robt. Sherwood, O. F. Griffin, H. E. Griffin, W. E. Hale, B. F. Sides, A. H. Bogden.

WARD M. Co.—March 22d. The old Board of Trustees and officers were re-elected.

EQUITABLE TUNNEL & M. Co.—March 23d. Directors—John Esten, N. A. Hardy, Henry F. Grinnell, E. S. Farnsworth, Chas. H. Marble, Chas. S. Healy. President, John Esten; Treasurer, N. A. Hardy; Secretary, Charles S. Healy.

BALTIMORE CON. M. Co.—March 23d. Judge Heydenfeldt has been elected President and Coll Deane succeeds A. K. Grimm as Trustee of the company.

MINT M. Co.—March 25th. Directors—H. L. King, S. P. Taylor, Isaac Cook, Wm. Harney, Alexander Lowthwaite, H. C. Partridge, John Landers.

DANBY M. Co.—March 25th. Directors—J. P. Canton, A. E. Everett, O. F. Griffin, H. E. Griffin, Robert Sherwood.

MELONS CON. M. Co.—March 27th. Directors—G. K. Stevenot, E. K. Stevenot, George W. Dent, J. Care and Jas. Hamilton.

Two charges of forgery and one of misdemeanor, for obtaining goods under false pretences, are recorded at the city prison against A. Blacklock, alias McCaw, President of the Gulf of California Oyster and Canning Co.

General News Items.

THE proposed building for the deaf, dumb and blind asylum is to cost \$79,652.

THE geographical limits of the military divisions and departments of the United States are about to be rearranged.

A PENNSYLVANIA correspondent of the New York Herald says that 400 collieries and 60,000 men are idle in that State.

LARGE Catholic colleges will be erected at Omaha, funds for the same having been bequeathed by the late Edward Creighton.

GOVERNOR HENDRICKS, of Indiana, the defeated candidate for Vice-President at the late election, has been in San Francisco for several days.

MESSRS. ROTHSCHILD telegraph from London that the Syndicate are ready for another call of \$10,000,000 for the redemption of United States six per cent. bonds of 1865.

A DISPATCH from Red Cloud agency says: Spotted Tail has been heard from. He was going on to complete his mission of peace to the hostiles. He had been delayed by the bad weather and poor condition of his horses.

A DISPATCH from Rome announces the arrival of congregations to counsel the Pope to fulminate the great excommunication against Victor Emmanuel, should the clerical abuses bill pass.

THE President has appointed Samuel B. McLean Associate Justice of the Supreme Court of New Mexico, and Wellington Bird, of Iowa, agent for the Indians of the White River Agency, Montana.

ABOUT 800 tons or 16,000 bunches of bananas are now shipped monthly from Aspinwall to New York, worth, when delivered there in good order, at the rate of \$600,000 a year. This industry is constantly increasing.

WASHERWOMAN's bay, that nucleus of pestilence back of the city, is to be cleansed at last. To perform this Augean task 100 prisoners will be chosen from the county prison, and will be kept busily at work until the bay is filled up. The residents of the neighborhood have subscribed \$1,200 for the purchase of the necessary tools.

ADVICES from Congo, west coast of Africa, state that the British war steamer *Avon* had destroyed seven villages on the Congo river and killed three natives as a punishment for plundering the American schooner *Thomas Nickerson*, of New York. This vessel had been captured by the natives and about 30 tons of coffee were carried off. She was fired by the *Avon* in order to prevent further plunder.

ANOTHER disaster through the breakage of a dam is reported. This occurred this week at Staffordville, Conn. There was plenty of time for the removal of property before the dam burst, as it had leaked and every effort was taken to mend it. The dams of the Phoenix company, the Howe company and the Valley company were destroyed. The damage is estimated at \$350,000. About 1,000 hands are thrown out of work.

THE Spring Valley Water Company intend to follow the example of the gas companies here and elsewhere, and measure the quantity of water used by its purchasers. They contemplate attaching meters to all the connections with their pipes, and if more than 3,000 gallons are used during any month the consumer will be obliged to pay for the excess at the rate of \$1 per 1,000 gallons. Manufacturing houses and hotels now receiving water at the rate of 50 cents per 1,000 gallons will continue to pay so much a month for that privilege, and if they use in excess of their allowance will pay for the quantity so used, at the rate of 50 cents per 1,000 gallons.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco.

COMET COAL M. Co.—March 24th. Location, Amador county. Directors—C. B. Hand, E. Heydenfeldt, E. R. Palmer, John Landers and T. P. Hittle.

MINEERS' BANK OF SAVINGS—March 24th. Object: To do a general savings bank business. Capital stock, \$5,000,000. Directors—Geo. H. Wheeler, Chas. E. Scranton, H. C. Barnes, T. A. Waterhouse and Wm. Hood.

NEVADA CON. COPPER & S. M. Co.—March 26th. Location: Nevada. Capital stock, \$10,000,000. Directors, D. McDougal, E. de F. Curtis, T. H. Alexander, John Cornwell and F. A. McGee.

FRANCO-AMERICAN SAVINGS BANK—March 26th. Capital stock, \$300,000. Directors—Geo. C. Perkins, A. Comte, Jr., A. Brand, F. Chevalier, L. Peres, M. Kane, P. Hasson, F. de St. Germain and Charles B. Brigham.

EMMETT CON. M. Co.—March 26th. Location: Nevada. Capital stock, \$6,000,000. Directors—S. P. Dewey, G. T. Lawton, G. F. Bragg, J. A. Paxson and C. D. O'Sullivan.

OAK RIDGE HYDRAULIC M. Co.—March 26th. Location: Placer county. Capital stock, \$1,000,000. Directors—W. Wilson, J. H. Crossman, C. Nelson, H. G. Maynard and John Apple.

EUREKA BONANZA M. Co.—March 26th. Location: Nevada. Capital stock, \$10,000,000. Directors—A. S. Robbins, F. E. Atkinson, C. Convis, J. M. Starkweather and D. McLauren.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

Don't trifle with a poor watch when you can buy a good one of Dewey & Jordan, 433 Montgomery street, San Francisco, at prices according to the times.

Cost of Mining in Deep Mines.

Every ton of ore extracted from the Con. Virginia and California mines leaves a corresponding vacuum. That space is filled with solid 14 and 16-inch timbers, leaving only a sufficient space between the huge bulkheads for the passage of men and cars. The timbers used for this purpose are cut at the summit of the Sierra Nevada mountains, floated in flumes to the line of the Virginia and Truckee railroad and then brought by rail to Virginia City. The cost of these timbers at the mines are about \$21 per thousand feet.

At even those figures it is much cheaper to fill the vacancies occasioned in the mines by the extraction of ores with timber than to employ men to excavate and fill in the same deficiencies with waste rock.

Aside from the cheapness and convenience of this method of securing a mine, there is yet another very important feature to be considered. It is a fact that the ore bodies above, below, on every side, are continually working—literally alive.

This is not noticeable to any great extent while the miners are at work, for the noise and confusion drowns the sounds, and the continual change of operations hides, in a measure, the signs. But let a man unused to mining tarry for a few hours on the lower levels after the departure of the workmen, and listen to the snapping of the timbers, watch the pebbles break loose and roll down the face of the ore stopes; see huge rocks and slips of clay leave their places and drop from the sides of the drifts, and hear the grinding, crunching sounds that greet his ear on every hand, and the hair will almost rise on his head, and a dread, shrinking feeling of awe and fear take possession of his soul.

In the California mine the ore body is worked in sections. In one place where the second section was carried up, and while rising a distance of 50 feet, the length and number of sets of timbers being exactly the same, they would not match by three feet or more. On the south line of the Ophir where there had been no extraction of ore, the timbers have sunk until the tops of a set seven feet in length are now just on a level with the car track.

The necessity of filling a mine with such material creates a fearful responsibility on the part of both the managers and foremen. These immense blocks and piles of pine wood soon become dry as tinder, and in many places are ground and crushed by the fearful forces at work to a mass of splinters, ready to ignite at the slightest touch.

Should a fire occur, aside from the loss of life which might ensue, the lapse of years would not make it safe for a miner to attempt to again work his way into the ruins.

In the Consolidated Virginia and California mines nine watchmen are employed with each shift of men, whose sole duties are to follow and watch the men, and see that no candle or light is left carelessly in any portion of the mines.

Smoking is strictly prohibited by either employees or visitors, and a man caught breaking any of the regulations in that respect is instantly sent on top. Wherever it is necessary to place a stationary light at a turn in a drift, shallow tin dishes filled with water are used, so that if the light burns down no accident can possibly occur. To the miner eternal vigilance is alone the price of safety.—*Gold Hill News.*

INDIA RUBBER TREES.—The Para india-rubber tree (*Hovea Braziliensis*) is so superior to the kinds which produce the gum in other parts of the world that the English government are raising large quantities at Kew, to be sent to British India. In the raising of these it was found that their rate of growth was remarkable. In a few days after sowing the plants were many of them 18 inches high.

RUMOR has it at Lagrange that three Celestials, who have been mining at Don Pedro's Bar, struck it last week, taking \$5,000 out of a small crevice in a few hours.

SENATOR SHARON denies that he has purchased, with James Keene, a controlling interest in the Sutro tunnel.

Dewey & Jordan have been at 433 Montgomery street, S. F., for 13 years. They are reliable—like the "New York watches" they sell.

THE GRAND PACIFIC.—This fine hotel, in the city of Chicago, cost \$1,300,000, and occupies an entire block. It is 130 feet high and has 500 rooms. It is a very elegant structure, and is a favorite resort for people from the Pacific coast, as everything is in the best style and all the arrangements are as complete as an efficient management and great experience can suggest. The building is specially secure against fire, as it was constructed with this object prominently in view, and every appliance known for the prevention of fire is at hand. In all its features the Grand Pacific has been guarded against the chief enemy of all large structures.

We can recommend the New York watch, of Springfield, Mass., as A. 1.

Choose a good companion only—one of Dewey & Jordan's "New York watches."

Mining and Scientific Press Patent Agency.

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free.

DEWEY & CO.,

Publishers MINING AND SCIENTIFIC PRESS AND PACIFIC RURAL PRESS, 224 Sansome Street, S. F.
A. T. DEWEY, GEO. H. STRONG,

The Rates of Postage.

Postal cards, one cent each, go without further charge to all parts of the United States and Canada; with an additional one-cent stamp they go to all parts of Europe. All letters, to all parts of the United States and Canada, 3 cents per half ounce.

Local or "drop" letters, that is, for the city or town where deposited, 2 cents if delivered by carriers, and 1 cent where there is no carrier system. Newspapers, daily, semi-weekly, tri-weekly and weeklies, regularly issued and sent to regular subscribers, 2 cents per pound, payable at the office of publication; newspapers and magazines published less frequently than once a week, 3 cents per pound. Transient newspapers, magazines, pamphlets and handbills, 1 cent for each two ounces or fraction thereof. Single copies of the PRESS weighing less than two ounces, the postage upon irregular numbers is 1 cent each. All other miscellaneous matter, including unsealed circulars, books, book manuscripts, proof-sheets, photographs, etc., and also seeds, cuttings, bulbs and roots, and merchandise not exceeding four pounds in weight, 1 cent for each ounce or fraction thereof.

The following are the postal rates with Europe. The rates for letters are for the half ounce or fraction thereof, and those for newspapers for four ounces or fraction thereof:

Iron and Machine Works.

PACIFIC ROLLING MILL COMPANY,
SAN FRANCISCO, CAL.

Established for the Manufacture of
RAILROAD AND OTHER IRON

—AND—
Every Variety of Shafting,

Embracing ALL SIZES of

Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames,

—ALSO—

Hammered Iron of Every Description and Size.

Orders addressed to PACIFIC ROLLING MILL COMPANY, P. O. Box 2032, San Francisco, Cal., will receive prompt attention. OFFICE: 16 First Street.
The highest price paid for Scrap Iron.

THE RISDON

Iron and Locomotive Works,

INCORPORATED.....APRIL 30, 1868
CAPITAL.....\$1,000,000.

LOCATION OF WORKS:

Corner of Beale and Howard Streets,
SAN FRANCISCO.

Manufacturers of Steam Engines, Quartz and Flour Mill Machinery, Steam Boilers (Marine, Locomotive and Stationary), Marine Engines (High and Low Pressure). All kinds of light and heavy Castings at lowest prices. Cams and Tappets, with chilled faces, guaranteed 40 per cent. more durable than ordinary iron.

Directors:

Joseph Moore, Jesse Holladay, C. E. McLane,
Wm. Norris, Wm. H. Taylor, J. B. Haggin,
James D. Walker.

Between Sansome and Leidesdorff Sts., San Francisco.

SHEET IRON PIPE.

Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special patterns for Mining Cars. These small wheels are made of the best Car Wheel Iron, properly chilled, and can be fitted up with the improved axle and box—introduced by this company, and guaranteed to outlast any other wheels made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

THE ASBESTOS PATENT FIBER COMPANY,

TWO MEDALS OF HONOR.

HIGHEST MERIT.

Of Philadelphia, offer for sale through their agent in San Francisco,

Asbestos Steam Packing, Asbestos Boards and Asbestos Steam Joints,

All manufactured from the pure utilized Asbestos Patent Fiber, and under patents granted to J. S. Rosenthal. The packing is in all sizes from one-quarter to three inches in diameter, round, and free from all grit or mineral matter. The non-utilized or crude Asbestos, manufactured by some parties into packing, is impure and gritty, liable to injure the piston rod and should not be used. The packing made under the Rosenthal patents is of pure utilized Asbestos fiber, and a very superior article and entirely different from the so-called Asbestos packing heretofore offered for sale. It is compact in form, will not fuzz or disintegrate, and will wear much longer than any other kind of packing. The indestructible, expanding, contracting and lubricating qualities of Asbestos are now universally recognized, and packing made from it is peculiarly adapted for steam engines and pumps.

ASBESTOS PATENT FIBER BOARD.

This is the champion non-conductor, to prevent radiation of heat and condensation of steam, as covering for marine, stationary, or locomotive boilers and pipes, and for lining wood-work, where exposed to great heat. It is light, flexible, is not disturbed by vibration, and will not char or crumble. The sheets are 30 by 44 inches, of any desired thickness, and are easily applied.

ASBESTOS PATENT FIBER STEAM JOINTS.

Indestructible by fire or water, expands and contracts in a desirable manner, adjusts itself to any rough point, is cheaper than rubber, and in all respects a superior article. PURE ASBESTOS FIBER for packing steam governors and other purposes. All these goods are extensively used in the Atlantic States and give general satisfaction.

Also, For Sale by

DUNHAM, CARRIGAN & CO.,
107 & 111 Front Street.

PHILIP HINKLE,

SOLE AGENT FOR THE PACIFIC COAST,

118 & 120 Main Street, San Francisco,
At the Hydraulic Elevator Works.

PATENTED CAST STEEL SHOES AND DIES.

Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of iron from which our Steel is manufactured, and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at twelve cents per pound, delivered at San Francisco or Sacramento, instead of sixteen cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc., etc.

Address all orders, with dimensions or drawings, to

CAST STEEL SHOE & DIE CO.,

59 Nevada Block, S. F.

ASBESTOS COATING

For Steam Boilers, Pipes, etc. Best non-conductor of heat in use. It effects a LARGE SAVING OF FUEL, LASTS AS LONG AS THE IRON to which it is applied, and is reasonable in cost.

PICKERING ENGINE GOVERNOR.

VALLEJO FOUNDRY, October 17th, 1876.

Messrs. NEYLAN & YOUNG, San Francisco, Agents for "PICKERING GOVERNORS."

Gents:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this year for my patent Straw Burning Threshing Engines give splendid satisfaction. They far surpass for regularity of speed any Governor that I have ever seen, and I have seen all the best kinds; I have seen the main belt fly off the pulley several times this season while threshing, and the engineer did not discover it, so perfectly was the speed maintained, until he was told of it; this I consider something wonderful; I consider the Governor absolutely perfect, so far as speed is concerned. I bought and put on to one of my engines a Shive Governor, to see which was the best, and after one season's trial I have no hesitation in saying they are far superior to any other Governor that I have seen or used. I wish you would send me the lowest price that you can furnish 25 Governors for next season's engines. Yours respectfully, J. L. HEALD.

The only Governor that has received awards at each of the International Exhibitions. American Institute Fair, New York, 1865, Two Medals; Mechanics' Institute Fair, Baltimore, 1865, Silver Medal; American Institute Fair, New York, 1869, Two Medals; International Exposition, Paris, 1867, One Bronze and Two Special Medals; International Exposition, Vienna, 1873, Medal of Progress and Decoration; International Exhibition, Philadelphia, 1876, Medal and Diploma.

CAMERON'S CELEBRATED STEAM PUMPS

For Feeding Boilers and Draining Mines. MACHINISTS' TOOLS AND WOOD WORKING MACHINERY.

NEYLAN & YOUNG, SOLE AGENTS FOR THE PACIFIC COAST, 18 and 20 Spear Street, S. F.

\$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

REFERENCES.

A letter received from the Julian Mill, Newcastle, says of the Carrier Feeder: "It is the most perfect Feeder we have ever seen; don't see how any mill can do without them."—A letter from Mr. C. C. Belding, of Amador County, speaks in the highest terms of them. Two of the machines were shipped to the Bunker Hill Mill, also Governor Mill, Amador County. Mr. Stevenson, of Boston Mill, Gold Hill, Nevada, says they are the best Feeder he has ever seen. Soulsby Mill, Tuolumne County. California Company, Nevada City. Omaha Gold Mining Company, Grass Valley. St. Patrick Mill, Placer County.

\$1,000 CHALLENGE.

Backward in Coming Forward.

C. P. Stanford Fails to Come to Time on the Challenge of \$1,000 to Test the Merits of His Ore Feeder as Against Mine. The Challenge is Still Open to Him or any one else. GENTLEMEN, Put up or Shut up.

A letter has been received from the Crescent mine, Plumas County, in which it states that the Tulloch is a failure as against the \$1,000 Challenge Feeder of Hendy's.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

Patent Agency.

Publishers, Patent Agents and Engravers
224 SANSOME STREET, SAN FRANCISCO.

Mining and Scientific Press.

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents. As an

ADVERTISING

Medium for the Pacific Coast, it is superior to any other journal for all kinds of mining and hydraulic machinery and other mechanical work, building materials, new manufactures and inventions. Our rates are very reasonable compared with those of other first-class journals.

DEWEY & CO., Publishers.

Campo, San Diego Co., Cal., July 3d, 1874.

Messrs. Dewey & Co.—Gentlemen: To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands. I remain yours truly,

A. M. GASS.

Dewey & Co. { 224 Sansome St } Patent Agt's.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Kroenke's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel, trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners' and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., Mining and Scientific Press, 224 Sansome Street, San Francisco.

UNITED STATES

Mineral Land Laws, Revised Statutes,
AND INSTRUCTIONS AND FORMS

UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, 1875—No. 163,940. Thanks to you for your prompt attention to the case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific coast to give you a call, which I think they will never have any cause to regret. Very truly yours,
GEO. G. BUCKLAND,
Stockton, Cal.

Thanks for Prompt Attention.

Stockton, June 26th, 1875.

Messrs. Dewey & Co., S. F.—
I have received the patent for my invention in wagon brakes, which you prosecuted for me; patented May 11th, 1875—No. 163,940. Thanks to you for your prompt attention to the case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific coast to give you a call, which I think they will never have any cause to regret. Very truly yours,
GEO. G. BUCKLAND,
Stockton, Cal.

"SPEAKS WELL," ETC.—We would return thanks for an exchange and back numbers of the MINING AND SCIENTIFIC PRESS, published by Dewey & Co., of San Francisco, Cal. It is a well edited, interesting, and valuable journal and speaks well for our Pacific neighbors.—U. S. Mining and Manufacturing Journal.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick-silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1877.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration,

Mining, Engineering, Assaying,

and Metallurgy,

Containing 672 Pages and 83 Engravings,

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE—bound in cloth, \$10.50; in leather, \$12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by DEWEY & CO.

PACIFIC RURAL PRESS.

A first-class 16-page Agricultural Home Journal, filled with fresh, valuable and interesting reading. Every farmer and ruralist should take it. It is immensely popular. Subscription, \$4 a year.

Boiler Incrustation and Corrosion.

There is, perhaps, no subject connected with engineering science, which at the present time commands more attention or causes more perplexity than this. In marine engine practice its difficulties are most keenly felt; and of itself that is a field of operation large enough, as it involves interests sufficiently extensive to give great importance to the subject, and to demand the utmost exertions of engineers towards the solution of its problems, and the providing of remedies or preventive measures against the ravages of what is an active and powerful agent in the destruction of their work. But the range of action which this destructive agent has is bounded only by that which puts a limit to the use of steam, and hence many other interests besides those of engineers are involved in the matter.

The state of general information about this subject is very unsatisfactory, because it amounts only to the fact that obscurity, or at least uncertainty, prevails. Yet many facts of the greatest importance and interest have been noted, and, as is usual in such cases, there are some men who have considered these in the light of their own experience, with the intelligence which is needed in order to turn all to good account. As the subject is partly a chemical and partly a mechanical one, it demands, in order that it may be successfully grappled with, a combination of scientific and practical information which, in consequence of defective educational methods, has not been frequently found among many engineers. These scattered facts and observations have been brought together in a paper by F. J. Rowan, which forms No. 27 of Van Nostrand's Science Series (for sale in this city by Payot, Upham & Co.). This writer states that the course of investigation and inquiry called forth has been marked by the suggestion of various remedies. The earlier stages have produced the recommendation of a variety of empirical remedies or nostrums—substances which have been proposed for apparently every conceivable reason except an intelligent perception of the nature of the action to be counteracted, and consequently of the qualities requisite in their remedy. A list of these applying to incrustation is given in a paper by Mr. Jas. Napier, in the proceedings of the Philosophical Society of Glasgow, who gives also some account of the more rational methods proposed in his day. For corrosion a similar list has recently appeared—too large, however, to quote at length, and some methods have been proposed which have been more or less successful under special circumstances, but all partial in their application. Of these comes the endeavor to form a scale of salt by the use of a proportion of sea water, the use of zinc in the boilers, the filtering of the feed water, etc.

Incrustation and corrosion, although they both result in the destruction of boilers, are not one and the same action. The two actions are very dissimilar, yet they are often united in effecting the destruction of boilers and are often present successively in the same boiler (a crust being formed and then decomposed or partially decomposed), and are therefore often confounded. In the little treatise to which we refer this whole subject is treated at length and all the facts available have been condensed and the remedies suggested. Persons interested in the subject will find it of use to them.

W. A. GOODYEAR has issued a circular announcing that he will publish a comprehensive treatise on the coal mines of California, Oregon and Washington Territory, if he should obtain sufficient encouragement. As a mining engineer and member of the late Geological Survey of this State, he has had an excellent opportunity to study the subject thoroughly, more especially as he has within the past few years paid especial attention to this class of mines. Mr. Goodyear is a ready writer and the work will be of great value to the State. There is now no literature on the coal mines of this coast, although miners are sadly in need of it, and Mr. Goodyear's proposed work should meet with every encouragement.

Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening last. The following donations were received:

Yucca draconis, from Mohave desert, by J. T. Murphy; lynx, by R. H. Stretch; minerals from Oregon, by Prof. Davidson, from Arizona, by J. T. Jerome, and from Kern county, by J. P. Moore; crustacea, by Mr. Lockington.

Prof. Joseph LeConte, of the University of California, read a paper entitled "On Critical Periods in the History of the Earth, and Their Relation to Evolution."

Mr. J. R. Seupham read a paper on the introduction of foreign plants that are very rapid in

An Improved Metal Punch.

The invention herewith illustrated, besides being of novel mechanical construction, includes a simple and efficient arrangement for putting in and removing interchangeable dies and punches of different sizes. It is sufficiently powerful to punch readily a five-eighth inch hole in plow steel, and it has been practically tested with excellent success during the year which has elapsed since it was patented.

The operation is as follows: At *A* are the housings, near the top of which a cam lever, *B*, which forces down the punches, is pivoted. *C* is the die block, which slides freely in between the housings and is locked by a suitable spring pin. *D* are guide plates for the punch over the

Fish Breeding.

We are doing very well in this State in the way of introducing desirable kinds of fish and stocking our public waters with them. Last week we mentioned an appropriation which had been obtained from the general Government to forward this desirable work. We are also doing a good deal in the way of stocking private waters, and many a land owner will draw a cheap and nutritious breakfast from his ponds and streams as well as from his hennery, his garden or his herd. We hear of many cases of farmers who have introduced the carp from the ponds of Mr. Poppe, of Sonoma, and are obtaining satisfactory growth. Others are putting in trout. Reservoirs and streams are peopled in this way, and the latest note which we have upon the subject is that a man in Santa Cruz is going to stock his large tanks with this fish. We presume his water is cool and living, and, if so, we see no reason why he should not succeed. Some of the fattest trout we ever saw were in a tank or "pool," built in a New York dairy house, in which cans of milk were set for cooling. The water was constantly running in and out, and the fish were very thrifty. We have no doubt our farmers could do a great deal more in the way of making their water as productive as their fields if they were to give the subject attention.

In some parts of the mining districts, also, where water is plentiful, fish could easily be raised, which would afford an agreeable variety in the usual miner's food. Small ponds are easily made and if pipes were laid to a convenient flume or ditch, the fish could have fresh running water at all times without decreasing the supply of water. We have seen many places where this could be done with little trouble, and some of our friends in the mines might easily carry out our suggestion with benefit to themselves.

The last time we saw the late Mr. Quinby, the celebrated bee-keeper, he was busily engaged in hatching trout to fill a group of ponds, which he had contrived on the side-hill which rose behind his house, filling his ponds with the water from springs which issued forth above. Indeed, the Eastern farmers are awakening to the opportunity which lies in their water resources. In the report, January 1st, 1877, of the Connecticut Fish Commissioners, we read: "There are few enterprises enjoying public attention at the present time that promise more profitable results than the multiplying of food fishes in fresh water ponds. It is the belief of all who have studied the subject, that fresh water fishes of all kinds can be multiplied almost indefinitely, and so cultivated as to be improved not only in quantity but in quality, and made to be the cheapest of cheap food. This fact should be repeated over and over again, until every one who has a patch of water on his premises large enough for tadpoles and shiners, can make it yield an abundance of wholesome fish food, at not half the trouble and expense with which he cultivates a like patch of ground. The food thus produced is too much neglected by the whole community; it affords elements of nourishment necessary to a healthy condition of the body, for which no cheaper available substitute can be found." The report describes 256 ponds of five to 2,000 acres each, aggregating 31,604 acres in Connecticut alone—"These contain a considerable number and variety of food fishes—although probably not a thousandth part of what this may be made to produce at a little expense of time and money. Besides these (256) large ponds there are a greater number of ponds of less than five acres each, that are in like manner capable of development." From this it appears that the undertaking does not require any great stretches of water, and doubtless in our own State, as in Connecticut, there are chances for profitable work on a small scale.

HUMBOLDT district, Arizona, has about 20 miners, who are all doing well, working ores by the old Mexican process, *arrastras*.

The law taxing the net proceeds of mines is hereafter to be enforced in Yavapai county, Arizona.

BUSH'S METAL PUNCHING MACHINE.

growth and destructive to agriculture and gardening. He specially passed censure upon two grasses—the knot grass, introduced from the West Indies, where it grows very rank and is a deadly nuisance to the plantation, and the Bermuda grass, imported from India, and known in Sacramento as the witch grass. Animals eat it readily, but it has little sustenance, and if allowed to grow freely is almost ineradicable. In the Southern States it is used as a protection to the levees, but is found objectionable on the plantations. The first nip of frost changes this grass to a brown color, and it remains brown all the summer.

QUICKSILVER.—There were 4,312 flasks of quicksilver exported last month, valued at \$143,570. The above shows an average of 43¢ per pound, which is the lowest this year. During the previous month we shipped 6,779 flasks by sea, the largest quantity ever exported hence. For the month of March, 1876, we exported 3,923 flasks, valued at \$178,500, against 2,027 flasks, valued at \$169,700, for the same month in 1875.

die. A head block, *E*, serves to connect the punches to the cam lever, the attachment being effected by lugs which engage the lever by its grooves. The punch is secured in place by sliding the head into a channel above the slotted plate through which the shank hangs, the lower end being in the guide plates, *D*.

It will be observed that the mechanical power is very advantageously applied, that the punch and die, although easily removable, are tightly held, and that the general construction of the device is strong and durable. Two sizes of the machine are made, weighing respectively 175 and 275 pounds. They are excellently adapted for use in ironing wagons and blacksmiths' ordinary jobbing work.

All that is necessary to change to a different sized punch, is to loosen two burrs, change the die-plate and punch, and return the die-block to its place and tighten the burrs. For further particulars address Clayton Bush, Sextonville, Richland county, Wisconsin.

THE PRESOTT *Miner* records the discovery of a garnet mine near that city.

CORRESPONDENCE.

Silver Mines in Sandstone.

[From our Traveling Correspondent.]

It has been but a few years since the investment of capital in limestone was deemed hazardous in the extreme. It is now a well established fact that some of the most productive mines of Montana, Utah and Nevada are encased in this formation. The idea is perhaps almost universally prevalent that silver is not to be found in paying quantities in the sandstone. Instances of its occurrence in this kind of rock are by no means frequent, it is admitted, judging from the discoveries already made. It has, therefore, been thought advisable, in view of the present chronic skepticism upon the subject, to make the following short citations from Prof. Dana's "Manual of Mineralogy"—an authority in such matters that none will call in question:

"Silver occurs in rocks of various ages; in gneiss and allied rocks, in porphyry and limestone, as also in sandstone and shale, as recent, even, as the middle secondary, as in Prussia, and probably in the mining region of our own Michigan."

Again: "The Chilean mines on the western slope of the Cordilleras, in South America, are connected mostly with stratified deposits of a shaly sandstone, and occasionally of a conglomerate character."

This much seemed to the writer required by way of introduction to the comparatively recent discovery of what gives promise, so far as can be judged from present developments, of becoming

An Exceedingly Inviting Field

For mining enterprise. With the exception of some prospects, which will receive attention in proper order, the active operations are confined to Silver Reef and Leeds, or to the immediate vicinity of these villages, which are situated in Washington county, southern Utah, 18 miles north of St. George, and 300 miles south of Salt Lake City.

The Sandstone,

However, covers a large area compared with that of the silver deposits, as these have thus far been found mostly in the white species, which is highly impregnated with lime—the formation, as a whole, of every shade and hue, having an extent north and south of at least 70 miles, with nearly as many in width. It occupies, apparently, a great basin, bounded on all sides by lofty ridges of granite and limestone, against which the waters of the ocean must have dashed for ages almost countless before such vast

Mountains of Stratified Rock

Could have been built up inch by inch as they must have been, carrying us in all probability far beyond the "middle secondary;" some facts not fully verified pointing as far back even as the carboniferous era of the earth's great past history. In the immediate vicinity of the mines, old craters are visible and other evidences of great volcanic activity are everywhere marked; trap, basalt and similar metamorphic rock being seen strewn on hillside and plain or capping the highest summits of the sandstone.

The White Reefs

Containing the mineral tilted up in opposite directions from a common center, as it were, by volcanic and other internal forces; and to be seen (the two great eastern and western reefs in particular) stretching southward as far as the eye could reach.

The Main West Reef

Forms something of a horse-shoe at its northern extremity, and dips west and north under a massive red reef—whether or not the old red sandstone of Hugh Miller is too difficult a problem to solve with the data at hand—but found in turn underlying or closely bordering upon lofty granite-ribbed and limestone-capped mountains in the background.

The East Reef

Has a dip in the opposite direction under a similar red and yellow hued formation, looming up towards the rising sun in reef after reef, now in abrupt water-worn, precipitous cliffs, now carved into strange, grotesque, sometimes beautiful forms, requiring no great effort of the imagination to transform them into domes of magnificent temples, tall cathedral spires, lofty antique turrets or castles, or some grand old ruin of a once impregnable fortification, such only as the Titans or giants of olden times may be supposed to have built.

Questions Needing a Solution.

In brief, the whole scene, inclusive of formation, veins, and mode of mineral deposit, is a weird, wonderful and deeply interesting picture of nature's own painting—a book with many unsolved problems—written, too, in a language long since dead—requiring all the skill and acumen of the best scientists of the age to translate and unravel.

From which you will rightly infer that your correspondent has arrived at no very clear and positive conclusions of his own. Hypothesis

after hypothesis has been tried and as quickly abandoned, such as infiltration, sublimation, and the old, generally received theory for the formation of quartz lodes.

The Most Plausible Assumption

For the time being, was that the silver had been deposited at the same time with the sandstone during a period of great volcanic activity, in the form of a solution, being carried up in a vapor condition and more generally diffused, at that time through the waters of the sea. Some facts were presented by one of the observing miners that lead to the conclusion that the mineral, instead of settling on the sand from above, had come up from below, and that the vein was filled at the time of the upheaval of the strata, or perhaps long subsequently. Let us first have the facts as far as they could be gathered on so short an examination.

Some of these will doubtless need further confirmation.

1st. The silver is found in veins following the stratification, in no instance, as far as observed, cutting across the formation, except possibly in small seams connecting two veins.

2d. There are usually several parallel veins on the same reef, and at no very great distance apart.

3d. A species of talc or steatite is generally found as an accompaniment of the veins, lying on one side of the ore and in some cases comprising a portion of the gangue which frequently gives high assays.

4th. Another peculiarity is, that decayed vegetable mold, nodules and petrifications sometimes form a portion of the vein matter, running from \$100 per ton, high up in the thousands.

As the fact of finding petrified wood, except near the surface, has been questioned, a fine specimen, four inches in length, was secured, represented by Mr. Barbee, of the Barbee & Walker vein, to have come from the incline at the depth of 175 feet from its mouth. Even small specimens of stone-coal are said to be discovered.

5th. Quartz is nowhere seen and forms no part of the gangue.

6th. Sandstone cannot be regarded in any true sense as the matrix, the mineral not being generally diffused through it, but found deposited principally on the sides of the strata as a chloride, frequently very rich and abundant in that form of it known as horn silver. Where it is seen penetrating the rock, it takes the form of dark spots, or nuggets—spaces probably occupied by vegetable matter—which become a receptacle for the mineral, possibly an attractive home. As the unusually high assays from the ore in this quarter point strongly to the existence of a warm affinity on the part of the mineral for the vegetable.

A Final Hypothesis.

It is difficult to determine whether the talc in such intimate connection with the principal veins is itself a stratified deposit, having been previously erupted, or whether, as is possible, (not to say probable), it may not have been intruded between the strata of sandstone by the same force from some great smelting furnace near the great mineral belt below, that rent the rocks sufficiently to allow the fumes to escape and find their way into every seam and crevice on their passage to the surface, filling the cavities made by the decayed or decaying vegetable matter—the fissures forming so many long underground flues and condensing chambers where the richly laden fumes, dust and mineralized vapors found a lodgement.

The last hypothesis, modestly suggested, seems to correspond as well with the facts as any other, besides having the merit of being an encouraging one for the miner, for it must be almost self-evident from the assumption that the deeper he sinks, the wider and richer will be his flues, till he reaches the pure, solid plates of glittering silver, fresh from the anvil and hammer of Vulcan.

Some Detailed Statements.

Having theorized to some extent, and described in a general way the appearance of this novel and interesting region with its reefs and mineral veins, some facts and statements will be given in detail, going to show that

Ore, Both Rich and Abundant,

Is found here near the surface, (the greatest perpendicular depth being less than 150 feet), and thus far manifesting not the least tendency to a decrease in either value or quantity, but on the contrary, furnishing every evidence from week to week, as greater depth is attained, of improvement, both in the quantity and quality of ore, besides giving greater promise for permanence. Much of the ore, as will appear in the sequel, has been sufficiently rich to ship to Pioche or to Salt Lake, and at the same time pay a fine profit. But the prosperity of the district depends probably far more upon the thousands upon thousands of tons of a grade too low for shipment, running from \$20 to \$50, which can and will be extracted as soon as mills can be erected. On the authority of Col. D. E. Buell, who is familiar with the veins and character of the rock, the whole cost for mining, hauling and milling need not exceed \$17 per ton, while others make even lower estimates. Commencing at the north end of the west reef where it forms a semi-circle, just above Silver reef,

The Luna Mine.

(Lawson & Bush), at the depth of 45 feet shows a width of four and a half feet; the course of the vein east and west at this point and dip to the north. Here the talc crops out on each side of the sandstone ledge from 10 to 12 feet in thickness,

The Barbee & Walker,

Situated immediately west of the village, extends north and south 2,000 feet. It is owned and worked by Mr. W. T. Barbee. An incline 175 feet and drifts of 40 each way from the 150-foot level, show a vein five feet wide, with dip to the west at an angle of 40°. Character of ore, horn silver. The whole of the ore is mined and worked, yielding from \$75 to \$100 per ton. A few tons, selected for shipment, brought at the rate of \$160.

The Bonanza Mine,

of 1,500 feet, lying further south on this same reef, has been opened by a shaft 85 feet, cutting one vein at 45 feet in depth, with ore averaging \$110 per ton, and reaching another at the depth of 65 feet, from which point a drift is run for 35 feet in a solid vein of fine ore, said to be from four to six feet thick.

Hanly & Co.'s shaft, located in the valley some distance west of the Bonanza, is down 80 feet, and will probably reach the main vein at a further depth of 40 feet, with the chance of cutting another in its course.

The Leeds Mining Company

Occupy the next ground south, of 2,000 feet. Besides laying open their vein at three different points on the reef, a double compartment shaft has been sunk on the flat to the depth of 130 feet, where the dip of the vein was reached, cutting a small vein 40 feet above their main lode.

The company deserve much credit for the energy displayed in their operations. Their fine 10-stamp mill was put up and in readiness for running within less than 30 days from the laying of the first timbers. About 25 tons are crushed per day worth from \$90 to \$100 per ton, the whole of the ore being milled just as it comes from the mine, and is paying a fine profit.

The mill has been running about six weeks, and, notwithstanding some necessary delay in the meantime, some 40 bars of bullion, valued at from \$900 to \$1,000 each, have been turned out. Facts such as these need no comment. A few of such companies would soon work a wonderful change in the district. The remaining claims on this reef need not be described, as they are all much of the same character.

The Tecumseh Mine,

Located on a hill of the same name to the east, the property of Messrs. Barbee & Maynard, is worked mostly by chlorides, who receive a stipulated per cent. of the ore extracted. The veins on this part of the ledge are usually small, varying from four to 18 inches, but generally carrying ore of high grade. They differ from most of the other veins in the district in the slight inclination of their dip, some of them, in fact, being nearly horizontal. In the neighborhood of 400 tons of ore have been shipped from the hill during the past six months, giving a working value of from \$150 to \$1,000 per ton. The Maggie, owned by M. V. Coschina further south on the middle reef, is four feet in width, carrying ore from \$60 to \$90 per ton. From this point to the junction of this ledge with the main west reef, there are several fine locations, the most promising being

The Stormant,

Belonging to Messrs. Smith & Hardy, which is opening up beautifully, showing at the foot of an incline, 45 feet, a six-foot vein of solid ore. It runs from \$34, the lowest assay ever had, all the way to \$5,000 or upwards. It is pretty safe to conclude that the whole of the rock, from wall to wall, will work from \$100 to \$120 per ton. It is thought that every foot sunk on the incline will yield its two tons of ore, worth from \$200 to \$240 in the aggregate. The prospects here for a large and valuable mine could not be better.

Mr. R. T. Smith, of the Stormant, claims not less than 10 veins for the reef, at this point, running parallel, and from 12 to 15 feet. The proprietors of the Stormant also own the Emily Jane, the next claim adjoining on the south, which has four feet of high-grade ore, first-class averaging \$150, and second running from \$60 to \$80 per ton.

The Great Western,

On the east side of Kessell hill, has been laid bare for 150 feet along the reef, and also by incline on the vein. It varies in width from two to four feet. Some of the assays of ore have been as high as \$13,000. It samples \$75 per ton. It is the property of Kessell Bros., Ed. Kessell and B. M. Pearlman. The Crown Point, on the same hill, opened by incline 30 feet, shows a five-foot vein of ore, that is said to give average sample assays throughout of \$75 per ton.

The Vanderbilt Segregated,

Belonging to Messrs. E. Kessell, F. Brown and others, is situated on the main east reef, two miles from Leeds. An open cut of 20 feet has been run down on the vein, which widens in that distance from a few inches of good ore to three feet, the ledge matter running from five to six feet in width, the whole of which is represented as giving average samples of \$300 per ton. Sample assays for three classes show a value for the poorest grade of \$144; for second class, \$244; and for the highest grade, \$1,294, as per certificate of assayer—first class being probably pretty closely selected.

Friends Brown and Kessell, both acquaintances of long standing, may be congratulated as the fortunate possessors of what is believed to be a valuable piece of property, even if the ore should not work up to one-fourth the above figures, and they will, no doubt, pardon a little skepticism manifested on the part of the writer

when they expressed the belief that the whole of the ore had an average working value of \$600 per ton. The Steele & Lamb, south of last described and somewhat better developed, shows a four-foot vein of similar ore.

The Maud Mine,

Situated also on the east reef, from two to three miles south of the Vanderbilt, has been opened at several points by open cuts and inclines, as also by a perpendicular shaft that cuts the vein at the depth of 85 feet. It is probably 20 feet from wall to wall, and exhibits to the view an immense body of ore. The whole, from 18 to 20 feet in thickness, was estimated by Col. Buell, a fellow visitor at the time, to mill \$90 per ton on an average. Four lots of a few tons each, worked as a test, yielded as follows: First lot of four tons, \$389 per ton; second lot, \$406; third, \$609; fourth, \$1,002. Messrs. Gifford & Brisacher are the lucky owners.

The Toquerville Mining Company

(Mr. John R. James, Superintendent,) are working the Morning Star, the next claim adjoining, I believe, on the north, which is, in most respects, similar to the Maud, and probably fully as valuable. Some 12 to 15 tons, taken out near the surface on the top of the reef, averaged \$300, or upwards, per ton. There is a considerable amount of ore on the dump. The Superintendent is confident that enough can be extracted to keep a 20-stamp mill constantly supplied. The foundation for a custom mill of this number of stamps is already laid on the bank of the Virgin river, not more than 1,000 yards from this property, which will greatly enhance its value as well as that of other claims near this locality. The company are running a tunnel with the expectation of tapping the lode at the depth of 365 feet, besides cutting several veins in its course.

The Harrisburg, one mile below the village of the same name, was not visited, but is represented by Superintendent James as showing a continuous vein its entire length of 6,000 feet; the ore body four feet wide at the bottom of a 25-foot shaft, and giving average assays of \$85 per ton.

The Duffin,

Taking its name from its owner, is located some distance north of the Morning Star and the Maud on the east sandstone ledge, and, like its neighbors is giving every indication, external and internal, of soon developing into a first-class mine. Selected ore has milled at Pioche as high as \$333 per ton, a lower grade working from \$80 to \$100. There are 15 tons second grade on hand, valued at \$175, and a few tons first-class at \$350. The mine has been laid bare at different points for 1,400 feet, and has produced from \$10,000 to \$15,000 worth of ore.

The Butte No. 2,

In the suburbs of Leeds, belonging to Messrs. Williams, O'Dougherty & Aguayo, has a good strong vein of ore, four feet wide. There are 300 tons at present on dump, valued at \$80 per ton. The Loughery and Butte No. 1, the former adjoining on the south and the latter on the north, are, in all respects, similar to the above, some ore from the Loughery sampling \$200 per ton.

Advance Guard in Motion.

The Duffin, Butte No. 2, the Loughery and 750 feet of ground adjoining the Leeds company's claim on the south, together with the four-stamp water mill of seven tons capacity, belonging to Mr. Dupax, with water rights and lands adjacent, have all been contracted for by Col. David E. Buell and Mr. J. C. Clark, with the view of incorporating immediately. The Colonel, with his wonted energy, has already entered on the work of development. Mr. Clark is to have charge of the completion and running of the mill, to be increased to the capacity of 20 tons by the addition of stamps. The different claims embracing the property were personally inspected, and are looked upon as promising and valuable. The best guarantee of the success of the enterprise lies, however, in the well-known experience and ability of the gentlemen in charge.

A New District

Has been formed 22 miles north of Leeds, and is at present attracting some attention, the formation and the character of the ore being the same as those already described. The Columbia, Mountain Boy, Eureka, Centennial, Longberg and Maynard were discovered July last, by Mr. Chinn, and are said to assay from \$20 to \$800. The Columbia has been bonded to Mr. Jacob Ornstein, recently from Salt Lake City, and is represented as a 10-foot vein, assaying \$78 per ton, silver.

In conclusion, and as the reader has doubtless already inferred, there is an abundance of ore, particularly around Leeds, easily mined and milled, that will pay a handsome profit, with cheap facilities at hand for working. The very nature and singularity of the formation will, as a necessary consequence, lead to prudence and caution in the erection of mills, until the question as to the permanence of the mines is fully demonstrated by sinking, so that while crushing facilities are essential in opening up the district there is little danger of mill building going in advance of the developments. A. C. K.

MINING DECISION.—A dispatch from Eureka, Nevada, says: In the District Court, Judge F. W. Cole decided the case of Gleeson vs. The Martin White mining company in favor of the defendant. The property is situated in Ward district, and the case was tried in Hamilton in November last. The case will be taken to the Supreme Court.

MECHANICAL PROGRESS.

Effect of Quality of Steel on Tempering.

Doubtless many smiths among our readers are puzzled sometimes because the tools which they temper with the greatest care do not suit the workmen who use them. They will be pleased to know that the failure is not in their skill in tempering, but in the unfitness of the steel, although generally good for the especial purposes desired. The way in which this occurs and how it may be obviated is clearly stated in the following statement by Miller, Metcalf & Parkin, of Pittsburgh:

A piece of steel properly tempered should always be finer in grain than the bar from which it was made. If it is necessary, in order to make the piece as hard as required, to heat it so hot that after hardening it will be as coarse or coarser in grain than the bar, then the steel itself is of too low temper for the work desired. In a case of this kind the steel maker should be at once notified of the fact, who should immediately correct the error by furnishing higher tempered steel.

If a great degree of hardness is not desired, as in the case of taps and most tools of complicated form, and it is found that at a moderate heat the tools are too hard and are liable to crack, the smith should first use a lower heat in order to save the tools already made, and then notify the steel maker that his steel was too high, in order to prevent a recurrence of the trouble. In all cases where large quantities for the same purpose, as in the making of axes, springs, forks, etc., there is very little difficulty about temper, because, after one or two trials, the steel maker learns what his customer requires, and then can always furnish it to him.

In large, general works, however, such as a rolling mill and nail factory or large machine works or railroad shops, both the maker and worker of the steel labor under great disadvantages from want of a mutual understanding.

The steel maker receives his order and fills the sizes of tempers best adapted to general work, and the smith usually tries to harden all tools at about the same heat. The steel maker is right, because he is afraid to make the steel too high or too low for fear it will not suit, and so he gives an average adapted to the size of the bar.

The smith is right, because he is generally the most burried and crowded man about the establishment. He must forge a tap for this man, a cold nail knife for that one, and a lathe cutter for another, and so on; and each man is in a hurry.

Under these circumstances he cannot be expected to stop and test every piece of steel he uses, and find out exactly at what heat it will best harden and refine properly.

He needs steel that will all harden properly at the same heat, and this he usually gets from the general practice among steel makers of making each bar of a certain temper according to its size.

But if it should happen that he were caught with only one bar of, say, inch and a quarter octagon, and three men should come in a hurry, one for a tap, another for a punch, and another for a chilled roll plug, he would find it very difficult to make one bar of steel answer for all these purposes, even if it were of the very best quality.

The chances are that he will make one good and two bad tools; and when the steel maker came round to inquire he would find one friend and two enemies, and the smith puzzled and in doubt whether he ought to get mad or not.

There is a perfectly easy and simple way of avoiding all this trouble, and that is to write after each size the purpose for which it is wanted, as for instance: track tools, smith tools, lathe tools, taps, dies, cold nail knives, cold nail dies, hot nails, hot or cold punches, shear knives, etc. This gives very little trouble in making the order, and it is the greatest relief to the steel maker. It is his delight to get hold of such an order, for he knows when it is filled he will hardly ever hear a complaint.

INVENTING.—Inventing to-day, says the *Iron Age*, can be classed among the exact sciences. It is no longer a matter of happy accident or even sound mechanical judgment. The world has progressed rapidly during the last 30 years, and to-day we find that the merely ingenious man can do but little that is of value to the world. In other words, something more than ingenuity is necessary to the production of a successful invention. Thirty years ago and a good mechanic could hardly spend an hour in a shop without seeing an opportunity for improvement in something, and at that time what was true in one shop was true everywhere. Since then a whole generation has been steadily at work improving and inventing; mere ingenuity has exhausted its powers, and even originality has but a limited field in which to seek profit in inventing. The first task of the inventor now is to discover a want. He must then find out whether any attempts have been made to meet this want; if so, how, when and by whom. In other words, he must learn the state of the art, so that he may avoid traversing the footsteps of others who have failed. These are not waters which can be guessed at. They call for careful study, and when he has learned all he can about the subject he is ready to attack the problem intelligently—not before.

The Use of the File.

Most intelligent journeymen machinists, says Jesse Lord, in the *Polytechnic Review*, do not require any advice, direction or caution in the use of the file; but for apprentices and inexperienced workmen, a few words of suggestion may not be amiss.

First, as to setting the vise; the top of the jaws should not be higher than the elbow of the filler. This allows the forearm and hand to travel back and forth in a horizontal plane, a condition necessary to exact work. If the jaws of the vise are lower, the tendency of the filler will be to file most with the point, and if too high, the bearing will be on the portion nearest the handle; in neither case allowing a straight, or rather a level draw from front to rear. No good work can be done with the light of the vise jaws unadapted to the height of the workman.

No warped or sprung file should be used on work requiring straight filing. If such defective files are chosen by the "boss," they should be used simply in dressing off castings or forgings, but not to reduce work to a plane. No dependence can be placed on a spring file. The truth of a file, even in the bastard style, which has both faces and both edges curved, can be readily detected by the mechanical eye without a trial at the vise.

The file handle is important. No workman can do a good job with a file stuck into a piece of pine wood or a section of broom handle, nor even in a chisel handle. A file handle is *auis generis*—it is a file handle and nothing else. It is folly to attempt good work with a tool incompletely fitted; the handle is part of the file.

It is waste and extravagance to put a new file on cast iron until the scale has been removed either by grinding or by the use of a half-worn file. Neither is it economy to use a new, sharp file on wrought iron or steel. Give the new file to brass, then cast iron, then wrought iron.

To clean a file that is clogged with particles of wrought iron, there is but one way. The card is insufficient; it cannot remove the tenacious clinging particles. Take a piece of tough wire—No. 8 will do—and turning one end into a ring to form a handle, beat the other while cold into a flat chisel-shaped edge. The implement, when finished, is perhaps eight or 10 inches long. To use it, rest the file, point down, on a bench, and strike with the flattened edge of the wire across the teeth of the file in the direction of the cross-out. The cleaner will soon be toothed and will be found to be easily and rapidly cleaned. For ordinary clogging, wetting the file with oil, holding it over the forge fire or in a gas light for a moment, and then brushing with the card, will clean it effectually.

MECHANICAL FIRING OF STEAM BOILERS.—We lately noted the attempts which were being made in England to perform stoker's work by machinery. The following notes on the subject are from an address by Mr. J. W. Pearce: The author first pointed out some of the disadvantages of hand-stoking, and observed that so far back as 1813 mechanical firing was proposed. In 1822, Mr. J. Stanley invented a stoker with crushing rollers and a single horizontal fan, to which, in 1834, he added rocking fire-bars. In 1838 Mr. Juckes patented his first stoker, and in 1841 he invented the endless chain of fire-bars, modifying it again in 1842. In 1863 Messrs. Wilson & Smith brought out their furnace, in which the fire-bars were made to travel backwards, carrying the fuel from a hopper to the back of the grate, an arrangement which was improved upon by Messrs. Vicars & Smith in 1867. In 1870 Mr. Dillwyn Smith patented his stoker, in which the fuel is fed on to distributing fans revolving horizontally. This arrangement was improved upon, in 1870, by Mr. J. F. Deacon. Further additions were subsequently made by Mr. T. Henderson. The Henderson stoker was then described by the author. In it the supply of fuel is affected in the same way as in the Dillwyn Smith machine, but the fire-bars are made to move by simple gear connected with the stoker. Every other bar rises and falls, while the rest slide to and fro, the effect of this action being to clear off the clinker. The Frisbie feeder, improved by Mr. J. M. Holmes, is for slow combustion and intermittent feed. The coal is thrust up underneath, and in the middle of the fire, so that the gases evolved are consumed on passing through the incandescent mass. This stirs the fire and propels all clinker to the circumference of the circular revolving grate. Mr. Holroyd Smith's "Helix" fire-feeder gives a continuous feed from below by means of a screw working in a casing connected at its upper side with a trough which takes the place of one or two fire-bars. The saving effected by these stokers was stated to be two-fold, first in the quality of the fuel used, and next in the quantity consumed, a reduced first cost being also incurred, owing to smaller boilers and fire-grates serving for a given power, with more perfect combustion.

WEIGHING RECORD.—A new weighing machine, which gives a written indication of the load, has been invented by M. Chameroy, and is described in the *Bulletin de la Société d'Encouragement* for January. The impression is made on a thickish card, arranged so as to receive successively two impressions, indicating separately the gross weight of the load and the tare.

SCIENTIFIC PROGRESS.

How the Earth Might be Burned Up.

Professor Proctor, writing to *Belgravia*, notes the cases of star conflagration and "the effect which would result to the earth if our sun should thus be acted upon: These star conflagrations, it is believed, are caused by contact with other heavenly bodies—meteoric flights traveling on eccentric paths, or those in attendance of the comets. The meteors attendant on a comet continue to follow in its path years after the comet has disappeared. The effect of a comet, bearing in its flight many millions of meteoric masses falling upon the sun—should that take place—can be understood. Our sun seen from some remote star whence ordinarily he is invisible would shine out as a new sun for a few days, while all things living on our earth and whatever other members of the solar system are the abode of life would inevitably be destroyed. If a comet came out of that part of the constellation Taurus, arriving in such a time as to fall upon the sun in May or June, the light of the sun would act as a veil, and we should be instantly destroyed without knowing it. If it fell in November or December we should see it for weeks, and astronomers would be able to tell us when it would fall upon the sun. The disturbance upon the sun would be temporary, but there would be no students of science left to record the facts. The chances are largely against such an accident. Our sun is one among millions, any one of which would become visible to the eye under such an accident, yet during the last 2,000 years less than 20 such catastrophes have been recorded. Mr. Proctor moreover reassures us in another way. He says in effect that all but one of these conflagrations have appeared in the zone of the Milky Way, and that one in a region connected with the Milky Way by a well-marked stream of stars; that the process of development is still going on in that region, but that if there be among the comets traveling in regular attendance upon the sun one whose orbit intersects the sun's globe, it must have struck before the era of man, and that in our solar system we may fairly believe that all comets of the destructive sort have been eliminated, and that for many ages still to come the sun will continue to discharge his duties as fire, light and life of the solar system.

EXCRETION OF CARBONIC ACID.—A German chemist has, according to the *Journal of the Chemical Society*, made a long series of careful experiments to ascertain the quantity of carbonic acid given off in respiration and perspiration by different animals. In proportion to their weight, the largest quantity of carbonic acid is given off by birds—mammals come next—and worms, amphibia, fishes and snails form another group in which the excretion of carbonic acid is smaller; of these, worms give off the most and snails the least. Those that live in water give off more carbonic acid to the air than they do to the water; and young animals more than old ones. Experiments with colored light show that under the green and yellow more carbonic acid is excreted than in ordinary daylight; and on comparing light and darkness, it is found that much less carbonic acid is given off during the night than during the day. Among the rays of differently colored light, the milk-white and blue rays come next to the green and yellow in activity; and the red and violet are the least active of all the hues of the spectrum.

THE ELECTRIC LIGHT.—Some attempts have been lately made, says the *English Mechanic*, to improve the electric light by mixture of certain substances with the carbon, magnesium, etc., which, according to M. Achereau, greatly increases the luminous intensity. M. Gandrin has experimented with a variety of matters thus added. Phosphate of lime (from bones) thus mixed with the carbons doubled the intensity of the light; the calcium going to the negative carbon burned with a reddish flame, and abundant smoke was produced by the phosphoric acid and lime. Chloride of calcium and borate and silicate of lime give less light than phosphate of lime. They are decomposed, however. Silicon fuses, and is volatilized, and diminishes the light. (Several other substances were tried, with results which the author describes.) The flame and smoke accompanying these electro-chemical lights appear a serious obstacle to their utilization. The introduction of the substances, however, into the carbons is a useful way of studying the action of electricity on them.

TELEPHONES IN MINES.—The *Mining Journal* calls the attention of mine-owners to this wonderful instrument, which was lately described in these columns as a means of signaling in the mines. A telegraph wire can be laid through the mine, and with telephones at a few important stations, conversation can be carried on between those in different parts of the mine and those on the surface. Should an accident occur, the prompt notification of it and its nature might save many lives and much property; and the possibility of conversing freely between distant points without the necessity of skilled operators will unquestionably prove an incalculable advantage in mining, as it will be in other departments of industry.

OPTOGRAMS.—We have all heard, says the *London Medical Record*, with incredulity, of images seen at the moment of death being left imprinted on the eye. Current stories of such images being utilized for the purposes of justice in search of a murderer have been ridiculed by scientific critics. "The impossible" has, however, here once more been proved to be not far from the truth. Dr. Gamgee, F. R. S., of Birmingham, has described and verified the following experiment. Kuhne took a colored rabbit and fixed its head and one of its eye-balls at a distance of one and a half meters from an opening, 80 centimeters square, in a window shutter. The head was covered for five minutes by a black cloth and then exposed for three minutes to a somewhat cloudy midday sky. The head was then instantly decapitated, the eye-ball which had been exposed was rapidly extirpated by the aid of yellow light, then opened, and instantly plunged in five per cent. solution of alum. Two minutes after death the second eye-ball, without removal from the head, was subjected to exactly the same processes as the first, viz., to a similar exposure to the same object, then extirpation, etc. On the following morning the milk-white and now toughened retine of both eyes were carefully isolated, separated from the optic nerve and turned; they then exhibited on a beautiful rose-red ground a nearly square-shaped image with sharply-defined edges; the image in the first eye was somewhat roseate in hue and less sharply defined than that in the second, which was perfectly white. The size of the image was somewhat greater than one square millimeter. Prof. Bunsen was among the witnesses of this beautiful experiment. This permanent retinal photograph it is proposed to call an "optogram."

GLASS SILK.—The usefulness of glass silk to chemists and druggists has lately been brought to the notice of the French Société de Pharmacie by M. Limousin. The product is little known in France, but is now largely used in Germany, and especially in Austria, for filtering liquids in laboratories. (The mode of preparation, by winding fine threads of glass in fusion on rapidly rotating and heated cylinders, is probably familiar to our readers.) In the microscope the threads are as fine as those of silk or fibrillæ of cotton. They break more easily than the latter, but are excessively supple. From the inalterability of the substance, it is very well suited for filtering acid or alkaline solutions, even concentrated, and various other substances, such as nitrate of silver, albumen, collodion, Fehling's liquor, etc. It affords great rapidity of flow, with good filtration. It does not, like filters of paper or tissue, communicate organic matters to the liquids, altering and perhaps giving them a disagreeable taste. It is much preferable to amianthus, which from the arrangement of its parallel fibers cannot be formed into a flexible ball and which lets fragments pass that float in the liquid. For analysis it is very advantageous, allowing of a ready determination of insoluble matters deposited; also, by calcination and fusion of the glass may be found the volatile principles fixed in the passage of the liquid, unmixed with empyreumatic products. The price of glass silk is at present pretty high; but its excessive lightness admits of a considerable number of filtrations being made with a small weight of it. Besides, it may serve an indefinite time, if only after each operation it is abundantly washed with water and dried in air.

MAKE SOMETHING, PRODUCE SOMETHING!—Half the people of the world are idle for want of some over-seeing eye to set them to work. The advice which Haydon gave to the erratic poet Keats, to settle down to some definite purpose, needs to be given to almost one-half of mankind. There are very few persons but would find themselves comfortably well off if they would take hold of any one of a hundred pursuits and stick to it. Industry and economy will make a most wonderful change in many households. Make something. If those already at work making do not want your assistance start for yourself, make something. If you do not know how, then begin at once to serve an apprenticeship.

RUSKIN'S IDEA OF A SCIENTIFIC LECTURE.—Mr. Ruskin is a chronic growler. He says of a modern hall and a lecture in it: "Your present system of education is to get a rascal of an architect to order a rascal of a clerk of the works to order a parcel of rascally bricklayers to build you a bestially stupid building in the middle of the town, poisoned with gas, and with an iron floor that will drop you all through some frosty evening; wherein you will bring a puppet of a Cockney lecturer, in a dress coat and a white tie, to tell you smugly there's no God, and how many messes he can make of a lump of sugar. Much the better you are for all that when you get home again, aren't you?"

FOSSIL ANTS.—Mr. S. H. Scudder has been working upon a collection of fossil ants from South Park, Colorado. Heer, in his work on the fossil insects of Eningen and Radoboj, had found that most of the fossil ants discovered were winged females. It seems reasonable that this should be so, as the winged insects were most likely to fall into the water and be drowned, and especially the females, who are much more heavy-bodied than the males. Mr. Scudder had found about 40 species of ants in the collection, most of which were winged females. In amber fossils most of the specimens of ants are workers.

RINDERPEST has appeared among sheep in another London suburb. The Treasury Department at Washington recommends vigilance on part of Customs officers in the matter of importation of horses, cattle, sheep and swine, so as to provide against the introduction of the rinderpest, which is pronounced infectious as well as contagious.

The Eureka Lode.

Definite proof of the existence of a mineral-bearing lode, continued explorations on which have demonstrated to a certain extent its value, the best evidence of which is the continued and persistent bullion-producing qualities which gives the locality in which it is found an enviable status in the mining world. It has been the misfortune of Eastern Nevada to have for its neighbor a lode which has had no rival among ore-bearing veins, and the fact was so patent that it has constituted itself a gauge by which the more humble but meritorious districts have been measured, and anything that did not approach the standard of the great Comstock has been regarded as almost unworthy of notice. This state of things is the more to be regretted from the fact that silver mining is a business that requires the help of capital intelligently employed before the most valuable discoveries can be utilized, and without its aid the richest mines lie idle. The struggle during the early years of the district was a prolonged and toilsome one, rendered so in a measure by the exceptional character of the ore, which demanded processes that the early pioneers were not familiar with and the poverty of those engaged in the developments of its resources. It is hardly worth while to trace the progress of the work, as it is a subject that our readers are familiar with, but it is pleasant to record the result and know that, although we have only had a brief existence of eight years, sufficient has been demonstrated to prove that we are beyond the era of experiment, and settled in life as a permanent community beyond the reach of decay.

The Eureka Lode.

A vein that has been explored to the depth of 1,000 feet and a length of 5,000 feet, in which ore bodies are met with at all points within the vein formation, certainly deserves to take rank as beyond the reach of doubt as to its value and reliability. We have pointed out certain resemblances between the Eureka lode and the Comstock, in which we believe we demonstrated a close analogy, but, as mentioned above, unscientific persons have reasoned that because the exact conditions of that lode were not fulfilled on Ruby hill there could be no comparison between the two. Perhaps not, but every one at all familiar with mines and who has gained that knowledge in different localities, is aware that in no sense is there any universal law governing the dimensions, directions, changes and metalliferous contents of veins. Every system or group and, to some extent, every vein is a problem by itself; but there are certain conditions which must be fulfilled before the term lode can be applied and other conditions as to what kind of a lode it may be. All authorities agree that the definition of a contact lode is the existence of mineral-bearing matter in a fissure occurring between country rock of different formations. What the formation of the country rock may be does not enter into the question, as the veins occur in rocks of different ages and geological periods; thus the ores of Freiberg are in gneiss, of Bohemia in sandstone and quartzite, of Hungary in greenstone, of Cumberland in argillaceous shale; on the Comstock in porphyry and syenite, and finally

Our Own Lode

Between stratified limestone and quartzite. The list might be carried out to an indefinite extent and would prove that silver-bearing veins occur in different country rocks, the origin of which are referable to distinct geological periods, and that each district in which a true contact vein is found has its own characteristics, and if it complies with the broad definition, may still be found to slightly differ from others of the same class. In the developments of what we shall term the Eureka lode, from the Richmond on the northwest to the Jackson on the southeast, clearly defined walls have been laid bare at various points throughout the workings, at the croppings on the surface and in the levels of the different mines. These are so fully exposed that we will not enumerate the different points, but if any of our readers are curious on the subject we will refer them to the testimony of Clarence King, Mr. Luckhardt, Mr. Keyes, and other experts in the mining suits. The filling of the vein differs from the outside or country wall rock in being metamorphosed or silicified by the action of heat or vapors probably due to the thermal deposition of the vein. There are many curious and

Entertaining Theories

In regard to the filling of fissures, but the one

generally accepted at the present time is that they are filled from below by means of solutions held in vapors and gases. This action would metamorphose the sedimentary limestone in which the fissure existed, and in dissolving the carbonic acid widen and enlarge the fissure. Wherever the silicious vapors were the strongest there we might expect to find the greatest evidences of action, and the fact is borne out in this lode, for the nearer we approach the ore bodies the softer and more broken does it become, and the more impregnated with oxide of iron. Between the vein matter and country rock there interposes a selvage of clay, plainly showing the line of demarkation. Within the limits defined by the clay seam and the quartzite foot-wall, the ore up to the present time has always been found, and never beyond these limits. In places these ore bodies extend from wall to wall, and their general dip is uniform with the plane of the foot-wall. The walls present striated and polished surfaces, which in itself is proof of movement.

The General Course

Of the walls are regular and correspond throughout the workings. There are faults and dislocations, and in parts of the vein bodies of the country have intruded, but these are characteristics of all veins and disprove nothing. Such are a few of the evidences of the existence of a true fissure vein on Ruby hill; any one who will examine all the data connected with the subject will be forced to admit the fact. We consider its existence as a guarantee to the permanence of all interests in the town, for it is reasonable

The Mining Industry in Amador County.

Mining, as a means for the investment of capital, is generally looked upon as attended with more than ordinary risks. All commercial transactions of a speculative character are more or less hazardous. The possibility of loss as well as the hope of gain are inseparable from the very nature of a speculation. The amount of possible loss is determined by the largeness of the anticipated gains. This is the rule which applies to all industrial and commercial pursuits. A man is willing to risk much where the prospective profits are correspondingly large. Viewing the subject from this standpoint, it cannot justly be said that mining is a riskier business than other enterprises. It is gauged by the same laws that govern commerce the world over. It may truthfully be said of any occupation that the majority of those engaged therein draw blanks instead of prizes. Apart from the manipulations of stock-jobbers, the reason why capital has gravitated toward the Comstock is not because mining is less risky there than elsewhere, but because of the few magnificent prizes which have been unearthed in that vicinity. Considering the amount of capital invested, the Comstock has nothing to boast of over many mineral regions of lesser note. It has given us mines which can outrank all others in the surrender of precious metals and profitableness to share-holders; but it must also be borne in mind that it has distanced all competitors in swallowing up money in a fruitless hunt for treasure.

Mining in Amador has been prosecuted more

of our mineral resources is the fact that nearly all the promising prospects in the county are held by poor men. It is no disparaging commentary upon their value to say that it needs capital to develop them. It rarely happens that a mine will pay expenses from the surface down. Not a mine in the county has done this. Scores of likely claims are lying idle to-day, simply because the claimants have no means to test their value. They can be purchased on reasonable terms. Amador county stands with outstretched arms inviting capital to enter her borders. The past and the present attest the reality of the wealth yet to be disintombed; but it takes wealth to reach it, and that's what we now want.

Great Red-breasted Rail.

The *Rallus elegans*, of Audubon, has been confounded with the *R. crepitans*, by other authors. The former, shown in our illustration, is altogether a fresh-water bird, and breeds and lives throughout the year far inland in the Southern States, only a few stragglers having been observed east of Pennsylvania; while the latter never removes from the salt marshes on the Atlantic, from New Jersey to the Mexican gulf.

This bird resides in the fresh-water marshes and ponds in the interior of South Carolina, Georgia, Florida and Louisiana. In the extensive marshes of the Southern States contiguous to sluggish streams, they may be seen gliding swiftly among the tangled rank grasses and aquatic weeds, or standing on the broad leaves of the yellow cymus and fragrant water-lily, or forcing their way through the dense foliage of pickerel weed and arrow-head. Twenty pairs have been found breeding within an area of 30 yards diameter in such places. The nests are built upon the ground, shallow at first, but as the nine or ten eggs are successively deposited, their walls are elevated to the height of six or eight inches by means of withered weeds and grass. The middle of April is usually the beginning of the breeding season, though some of them commence even a month earlier. They return to the same nests in successive years, and often repair or improve them. The young, which are at first black, leave the nest as soon as they burst the shell and follow their mothers along the borders of the streams and pools, where they find abundance of grass seeds, insects, tadpoles, leeches and small crawfish. At this season they may be easily mistaken for meadow mice.

In seasons of extreme drouth these birds wholly disappear from their accustomed haunts, and doubtless resort to the shores of larger and deeper ponds until after a heavy fall of rain. The young acquire the redness of their plumage the first summer and increase in size and beauty for several years, without experiencing any change in their coloring after the spring following that of their birth. The sexes differ in appearance only with respect to size, the males being considerably larger than the females. It is believed that this species raise but one brood a year, although the eggs may be replaced when destroyed during the period of incubation. Their flight is stronger and more protracted than that of the salt water species. When flushed they rise and go off with a chuck, their legs dangling beneath them, and alighting in the grass at a considerable distance they run off with surprising speed. Indeed, they depend for safety even more upon their fleetness and adroitness on foot than on the wing. They are less apt to take to the water than the *Rallus crepitans*, and are by no means so expert at diving. Their flesh is very good, especially in the autumn, when they feed on grass seeds. Their size, as well as their flavor, renders them desirable to the sportsman and epicure. Their eggs are also excellent, being preferable to those of the common fowl.

RAPID GROWTH.—When we imagine rapidity of growth we are apt to think of the lowest orders of vegetation, and to say of anything that it springs up like a mushroom is meant to be expressive of the most worthless rapidity. There are, however, some very useful plants of the higher types that grow very fast, and of these bamboo is an illustration. How very useful the bamboo is was seen in the Japanese department of the Centennial. Japan would hardly be the Japan we know without it. By some experiments recently made in Algeria, one species (*Bambusa viridi-glaucescens*), has been found to grow over 16 feet high in six weeks. This is over four inches and a half a day and beats our maize even in the warmest weather.

GREAT RED-BREASTED RAIL.

to suppose that further explorations will develop its grand resources in as marked a manner as that portion already worked. This, taken in connection with the fact that all along the lode there are uncovered ore bodies of larger magnitude than have ever been met with previously, and that these are found at the lowest point in all the mines, gives us proof that while litigation may check the development for a short time, nothing is surer than the promise of a prosperous and brighter future for those who have the faith and courage to await the fulfillment of these predictions.

MILLS AT WORK.—All the mills on Gold canyon are in full blast from the Divide to Dayton, with the exception of the Sapphire and Rhode Island. The Atlas, Douglas, Petaluma, Papoose, Pacific, Woodville, Boston, Devil's Gate, Pioneer, Sherman, Kelsey and Excelsior—12 in all—are crushing from the Justice. The Bacon and Trench are crushing ore from the Consolidated Virginia. The Hope is running on ore from the Buckeye; the Succor on ore from the Trojan; and the Humphries on tailings. The Ophir mill on the Carson, three miles above Dayton, will be started up on tailings from the Trench and Bacon mills.

MINT COINAGE.—The coinage at the mint in this city for March was as follows: Double eagles, value, \$5,420,000; number of pieces, 271,000. Trade dollars, value, \$337,000; number of pieces, 837,000. Half-dollars, value, \$233,000; number of pieces, 466,000. Quarter-dollars, value, \$366,000; number of pieces, 1,464,000. Dimes, \$22,000; number of pieces, 220,000. Total value, \$6,875,000; total number of pieces, 3,258,000. The largest number coined here in any previous month was in August, 1876, when it amounted to \$4,800,000.

with a view of securing a profit from dividends than speculating in the stock. The results go to prove that here at least mining is not such a hazardous game after all. We can point to our bonanzas, pouring their treasures into the pockets of shareholders year after year, and showing no signs of exhaustion. The Keystone makes no figure in the Stock Board, but the amount of bullion it has placed in circulation is astonishing. Among the oldest quartz mines in the county and speedily reaching a paying basis, its batteries have continued to crush out from \$30,000 to \$40,000 per month with a monotony that must be refreshing to its owners. The Consolidated Amador has had a checkered career, but altogether has achieved a name scarcely inferior to the Keystone. In the face of adversity, in spite of its double baptism by fire and flood, it holds on its way, declaring its dividends monthly with clockwork regularity. These are the solid mines of the county, for the reason perhaps that they are the oldest and most thoroughly developed.

Other mines are coming into note, and bid fair in the course of a few years to become firmly fixed in the list of paying claims. The Phenix of Plymouth is in an ore chamber of immense size; probably not equaled in the State. As far as we can learn it has proved remunerative to its owners. The Gover, near Amador City, is operating a vein of great richness, its monthly yield approximating \$30,000. It can be safely assigned a place among the dividend paying mines. Both these are comparatively new mines. Scattered along the mother lode are a number of other locations pushing to the front, and knocking for admission to the category of productive mines. Altogether we have no reason to blush at the results of mining enterprise here. They will challenge comparison with any mining region on the globe.

The great trouble that retards the opening up

The Redington Quicksilver Mine.

The *Napa Register* says: There is not much to attract the attention of a stranger in the surroundings of Knoxville. It looks like one of the waste places, vegetation having been killed by the sulphur smoke from the smelting furnaces. But she can boast of having the second largest quicksilver mine in the State. We have all heard of the Redington quicksilver mining company, and no doubt many have thought it a small affair, or it would take a place on the daily stock report. The capital stock, owned by a few persons, most of whom reside in San Francisco, amounts to \$1,025,000. They have a tract of land seven miles long by four wide, on which they keep 600 head of cattle and 100 head of horses and mules.

All the buildings are owned by this company. They have a working force of 280 men, all more or less directly connected with the mine. The Redington mine has eight levels, the ore in each showing well; there are three shafts, the main shaft having a depth of 550 feet, and is being continually deepened, the work being much retarded by water, though the pumps ordinarily raise about 80,000 gallons every 24 hours. The two air shafts have a united depth of 1,000 feet. In the hosting works are three engines, two of 40-horse power each, for hoisting and pumping, and one 20-horse power running two No. 8 Sturtevant blowers, for furnishing fresh air to the lower levels. The mine is run night and day, having two shifts of 10 hours each; about 150 tons of ore is raised daily.

There are eight furnaces, four for coarse ore and four for fine ore; they have a capacity to reduce 200 tons in 24 hours. Formerly the ores were all hand picked, requiring a large amount of extra labor, which is now done away with by what is called the fine ore furnace, a recent invention of the Superintendent, Mr. C. E. Livermore. Three important features of the furnaces are; first, they require only four men to attend them—two for each shift; second, they have a natural draft, requiring no blower; third, they reduce the ore much faster, the largest furnace reducing about 32 tons daily, with a consumption of only two cords of wood. The fine ore or screenings are placed on drying floors, which are iron plates placed over brick condensers. After being dried it is put into a hopper on top of the furnace and adjoining the drying floor. From the hopper the ore slides over an incline floor arranged in channels, through which the flames from the fire pass, and are deflected on to the ore. The ore is supported in the channels by riddle bricks two and a half inches from the floor. After being burned it is drawn out into a chamber at the bottom of the furnace, where it is allowed to cool before being withdrawn from the furnace. The fine ore furnaces have six brick, 10 iron and five wooden condensers. When all the furnaces are in running order, 1,000 flasks of quicksilver are made per month; at the present time only 500. The extremely low price of quicksilver has a very depressing effect, so much so that this company has thought strongly of stopping the mine, it costing about as much to manufacture it as they get for it. Six tons of ore yields about one flask of quicksilver. The lumber used by the company comes from Lake county; all other supplies from San Francisco. Ten thousand cords of wood are annually consumed.

The Manhattan Quicksilver Mine.

The *Lower Lake Bulletin* says: This splendid quicksilver mine is located in the northern extreme end of Napa county, a little over one mile and a half from the Redington or Knoxville mine, in a northwesterly direction, and is owned by Messrs. Knox & Osborne, the original discoverers and locators of the Redington, now one of the most complete in machinery and appurtenances on the Pacific coast. The Manhattan has but one furnace, of the Knox & Osborne patent, the capacity of which is 20 tons of ore in 24 hours. Sixty hands are employed, and are worked by shifts of 30 men each, which alternate every ten hours. The owners expend about \$2,500 per month, and the mine produces from 18 to 25 flasks of silver per week. The value of works and personal property is estimated at about \$500,000, and, with the mine included, at \$1,000,000. The owners have been offered the above sum frequently, but have as frequently refused to sell. Mr. J. M. C. Walker, the Superintendent, is a miner of large experience and an expert withal. Having but one furnace for coarse ores, the Superintendent had to devise means to reduce the fine ores, and the way he does it is novel and original with him. Instead of making adobes and drying them, as other miners do, he does just the opposite. The coarse and the fine are never separated—all the ore is piled together, and then water is thrown upon it until it is sufficiently wet for the fine ore to stick to the coarse. In this condition it is put into the furnace. One might suppose that more sulphuric acid would be formed by this process, but it is not the case—the formation in which the cinabar is found is mostly lime rock and entirely destitute of sulphur. The company own about 3,000 acres of pasture and farming lands and a large number of fine stock.

The engineers appointed to examine the suspension bridge, Niagara Falls, report it entirely safe.

USEFUL INFORMATION.

White House Whitewash.

The *American Manufacturer* publishes the recipe for the whitewash used on the east end of the Presidential mansion—the White House: Take one-half bushel of nice unslacked lime, slack it with boiling water; cover it during the process to keep in the steam. Strain the liquor through a fine sieve or strainer, and add to it a peck of salt, previously well dissolved in warm water; three pounds of ground rice, boiled to a thin paste; one-half pound of powdered Spanish whiting, and one pound of clean glue, which has been previously dissolved by soaking it well, and then hang it over a slow fire in a small kettle within a larger one filled with water. Add five gallons of hot water to the mixture, stir it well, and let it stand a few days covered from dust. It should be put on hot, and for this purpose it can be kept in a kettle on a portable furnace. It is said that about a pint of this mixture will cover a square yard upon the outside of a house, if properly applied. Fine or coarse brushes may be used, according to the neatness of the job required. It answers as well as oil paint for wood, brick, or stone, and is cheaper. It retains its brilliancy for many years. There is nothing of the kind that will compare with it, either for inside or outside walls. Buildings covered with it will take a much longer time to burn than if they were painted with oil paint. Coloring matter may be put in and made of any shade desired. Spanish brown will make reddish pink when stirred in, more or less deep according to quantity. A delicate tinge of this is very pretty for inside walls. Finely pulverized common clay, well mixed with Spanish brown, makes a reddish stone color; yellow ochre stirred in makes yellow wash, but chrome goes further, and makes a color generally esteemed prettier. It is difficult to make rules, because tastes are different; it would be best to try experiments on a shingle and let it dry. Green must not be mixed with lime; it destroys the color, and the color has an effect on the whitewash which makes it crack and peel.

THE COMMON SALT GLAZE.—To the purest accident are many of the utilizations of common substances due. One of the producing causes of prosperity of the Staffordshire pottery manufacture was the discovery of a cheap, durable glaze. The discovery was due purely to accident. At Stanley Farm, a few miles from Burslem, a maid servant was one day heating a strong solution of common salt, to be used in curing pork. During her absence from the kitchen, the liquid boiled over. Being in an unglazed earthen vessel, the solution, spreading over the outside, produced a chemical action which she little understood, and which did not compensate her for the scolding she received. Some of the elements of the liquid combined with those of the highly heated brown clay surface to produce a vitreous coating, or enamel, which did not peel off when the vessel was cold. The humble brownware vessel acquired historical celebrity. A Burslem potter, learning what had taken place, saw that glazed-ware might possibly hit the taste of the public; he introduced the system of glazing by means of common salt, a system at once cheap, easy and durable; and England has made many a million pounds sterling by the accidental discovery.

ASBESTOS PAPER.—*La France Nouvelle* gives the following account of the manufacture of an incombustible paper from asbestos. The new paper costs four francs per kilogramme. The paper mills are in the city of Tirol, where Victoria made his successful attempt to manufacture this paper, which is specially adapted for valuable documents, etc. It has recently undergone most conclusive tests by the Marquis de Barriere, at an exhibition of objects made of this substance, now being held in the Corso at Rome. Two card-board boxes containing papers, one made of ordinary material and the other of asbestos, were thrown into the fire. The former was entirely consumed, while the latter remained intact, together with the papers it contained. The most useful employment that has been made of this substance up to the present has been the manufacturing of it into theatrical hangings. This is an excellent use of it, and it is evident that if what is said of it be true, its sphere of usefulness is likely to be greatly extended.

IMITATIONS OF MALACHITE AND OTHER STONES.—A process of decoration which is calculated largely to extend the use of terra-cotta has been invented by Mr. Charles Brock, of the Watcombe Works, St. Mary Church, Devon. He mixes various earths and oxides, the colors and proportions of which will depend upon the special class of object to be imitated, and blends them at such a consistency as to prevent their mingling too much together. He then covers the surface of the article to be decorated with a veneer or thin layer of the blended materials. He next glazes the surface with a lucid glaze, and submits the article to burning, the result being an exact imitation of the description of stone or marble desired, and which is more durable than the real stone itself. This process can not only be used for ordinary pottery, but is also applicable to a great variety of purposes, such as architectural columns, bosses, panels, inlays for furniture, columns for busts, vases and other kindred purposes.

TESTING PETROLEUM.—In a recent lecture in regard to testing safe and dangerous oil, Dr. Chandler showed some interesting experiments. Some oil was placed in an open tester and gradually heated on a water bath with a thermometer. It was found to flash, or give off combustible vapors, at about 110° Fah.; and it burned at 118°, being what is called very safe oil. He then placed some of this same oil in a closed vessel resembling a metal lamp, but provided with a cork instead of the common head or burner, and having electric wires attached. On heating the oil to 85°, and sending a spark through the vapors, an explosion took place which blew out the cork with a loud report, showing that oil which has been considered safe gives out explosive vapor at ordinary summer heat.

PAVEMENT BLOCKS FROM SLAG.—A new process of casting and annealing paving blocks of furnace cinder, says the *Iron Age*, has been suggested, which is claimed to furnish a good and uniform material that resists wear and gives a good footing for horses. This process consists in taking the slag as it flows from the furnace and running it into molds placed upon a circular table. As fast as the molds are filled, they are moved away, and left to cool down to a dull red color. The molds are then opened, and the blocks are taken out and annealed in a furnace kept at a particular temperature for 24 hours. They are then finished, and may be used at once. The chief novelty of this process seems to be the annealing of the blocks of slag.

PATINA.—An imitation of patina for bronze objects of all kinds can be produced, according to the *Ind. Blatter*, by preparing a paint of carbonate of copper and any light alcoholic varnish, and applying it to the object with a brush. This green color penetrates the smallest recesses, and has, when dry, the appearance of patina. Carbonate of copper gives a blue patina, verdigris a light green, and intermediate shades of color can be obtained by mixing the two.

TO KEEP TOOLS CLEAN.—When tools are clean and bright, they may be kept so by wiping, before putting them away, with a cloth dipped in melted paraffine. If they are rusted they may be cleaned by soaking in kerosene oil, and then rubbing with an oily rag dipped in fine emery powder.

TO MAKE ROPES DURABLE.—To prolong the duration of ropes and retard their decay, steep them in a solution of sulphate of copper, an ounce to a quart of water, and then either tar them or immerse them in soap suds, four ounces of soap per quart of water. In the latter case there is no smell.

GOOD HEALTH.

Croup.

Croup is an inflammation of the inner surface of the windpipe. Inflammation implies heat, and that heat must be subdued or the patient will invariably die. If prompt efforts are made to cool the parts in case of an attack of croup, relief will be as prompt as it is surprising and delightful. All know that cold applied to a hot skin cools it, but all do not as well know and understand, that hot water applied to an inflamed skin will as certainly cool it off. Hence the application of ice-cold water with linen cloths, or of almost boiling water with woolen flannel, are very efficient in the cure of croup. Take two or three pieces of woolen flannel of two folds large enough to cover the whole throat and upper part of the chest, put these in a pan of water as hot as the hand can bear, and keep it thus hot by adding water from a boiling tea-kettle at hand; let two of the flannels be in the hot water all the time and one on the throat all the time with a dry flannel covering the wet one, so as to keep the steam in to some extent; the flannels should not be so wet when put on as to dribble the water; for it is important to keep the clothing as dry as possible, and the body and feet of the child comfortable and warm. As soon as one flannel gets a little cool put on another hot one, with as little interval of exposure as possible, and keep up this process until the doctor comes, or until the phlegm is loose, the child easier, and begins to fall asleep; then gently wrap a dry flannel over the wet one which is on, so as to cover it up thoroughly, and the child is saved. When it wakes up both flannels will be dry. The same result will follow if cold water is used, the colder the better; the cloths should be of muslin or linen and of several folds thickness, large enough to cover the whole throat and the upper part of the breast.—*Idem.*

NERVOUS COUGHING.—Dr. Brown-Sequard once gave the following directions, which may prove serviceable to persons troubled with a nervous cough: "Coughing can be stopped by pressing on the nerves of the lips in the neighborhood of the nose. A pressure there may prevent a cough when it is beginning. Sneezing may be stopped by the same means. Pressing, also, in the neighborhood of the ear may stop coughing. Pressing very hard on the top of the mouth inside is also a means of stopping coughing. And I may say the will has an immense power, too. There was a French surgeon who used to say, whenever he entered the walls of his hospital, 'The first patient who coughs will be deprived of food to-day.' It was exceedingly rare that a patient coughed then."

Coffee-Drinking.

How strong should coffee be taken? is an inquiry of much practical importance. How much should be taken at a meal? is scarcely of less moment. Coffee, like any other beverage, may wholly ruin the health; the very use of it tends to this ruin, as certainly as does the use of wine, cider, beer or any other unnatural, stimulating drink. There is only one safe plan of using coffee, and that is never, under any circumstances, except of an extraordinary character, exceed in quantity, frequency or strength; take only one cup at the regular meal, and of a given, unvarying strength. In this way it may be used every day for a lifetime, not only without injury but with greater advantage than an equal amount of cold water, and for the simple reason that nothing cold should be drunk at a regular meal, except by persons in vigorous health.

One pound of the bean should make 60 cups of the very best coffee. If a man takes coffee for breakfast only, one pound should last him two months, or six pounds a year.

One pound of coffee should be made to last a family of 10 persons, young and old, one week. Put about two ounces of ground coffee in a quart of water, or rather divide the pound into seven portions, one for each breakfast in the week, and make a quart of coffee out of it, which will be 64 tablespoons. Give the youngest two tablespoonfuls and the oldest a dozen; the remainder of the one cup being filled up with boiled milk. This will give a cup of coffee sufficiently strong for all healthful purposes, for the respective ages; and for various reasons, pecuniary as well as physical, some such systematic plan as this should be adopted in every family in the land. How to make the cup of good coffee? is a third question. It is perhaps as good and as easy a plan as any to buy the coffee in the grain, pick out those that are imperfect, wash it, parch as much as will last a day or two, with your eye upon it all the time until it is of a rich brown, with no approach of black about it. Grind only enough for the day's use; grind it fine, for the greater the surface exposed to the hot water the more of the essence you will have; pour the boiling water on the coffee, close it up, boil it 10 minutes, let it stand to clear 10 minutes, then use.—*Hall's Journal of Health.*

OVER-EATING.—If the food is wisely chosen there is not much danger of over-eating. Dr. Beard says: It is a fallacy to suppose that people, as a rule, eat too much, and that most of the diseases of the world come from over-feeding. The truth is that among all decent or civilized people the tendency is directly the reverse. In our country, and especially in our large cities, far more are underfed than overfed. Throughout our land thousands and thousands die every year from actual starvation. Some of these unfortunates are little children whose parents are too ignorant or too poor to give them what is necessary to sustain life. But many of them are adults, whom hard poverty or sad ignorance has forced into a habit of systematic though undesigned starvation. Day after day the vital powers slowly fade, the strength grows less, the spirit becomes morbid and the face wan and dejected. Disease now steps in, attacks and carries by force some important citadel of the body, and death follows: The process is a slow one—sometimes very slow—extending, perhaps, over many years, but it is oftentimes as sure as it is slow.

SUGAR OF MILK FOR DIARRHEA.—Dr. Talmay prescribes for the diarrhea of hot countries, from 20 to 300 grammes of sugar of milk daily. He administers it in the simplest way: the sugar, dissolved in a little water or as a draft in the course of the day. An excellent mode of administration consists in putting the dose of sugar of milk to be taken, into a half a liter or two liters of milk, according to the habits and the digestive capacities of the patient. The treatment is spread over several months, diminishing the dose as nutrition becomes more considerable and easier. According to M. Talmay's little work (published by Coccoz, Paris), the endemic diarrhea of hot climates is the result of a functional lesion of the liver, which results in the diminution and even the suppression of the glycogenic function of the liver. The sugar of milk may thus replace the glucose which is wanting in the blood.

CHOOSING A PHYSICIAN.—"To choose a physician," as Lady Mountcashel has well remarked, "one should be half a physician one's self; but as this is not the case with many, the best plan which a mother of a family can adopt, is to select a man whose education has been suitable to his profession, whose habits of life are such as prove that he continues to acquire both practical and theoretical knowledge, who is neither a bigot in old opinions nor an enthusiast in new; and, for many reasons, not the fashionable doctor of the day. A little attention in making the necessary inquiries will suffice to ascertain the requisites here specified; to which should be added what are usually found in medical men of real worth—those qualities which may serve to render him an agreeable companion; for the family physician should always be the family friend."

The mid-day meal should be light or delayed till the work is done. Intense brain work can not go on at the same time the stomach is strongly taxed in digesting food.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:

Saturday Morning, April 7, 1877.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Boiler Incrustation and Corrosion; Academy of Sciences; An Improved Metal Punch; Fish Breeding, 209. Economy in Working; California Copper; Lecture by Dio Lewis; The Pacific Power Company's New Building; Notices of Recent Patents, 216. First Settlement and Early History of the "Eastern Slope," No. 2; Items of Interest from the Mines; What California Has Not, 216. Patents and Inventions, 220.

ILLUSTRATIONS.—Bush's Metal Pumping Machine, 209. Great Red-Breasted Rail, 214. Rittinger's Double Concussion Table, 217.

CORRESPONDENCE.—Silver Mines in Sandstone, 210. From Our New York Correspondent, 220.

MECHANICAL PROGRESS.—Effect of Quality of Steel on Tempering; Inventing; The Use of the File; Mechanical Firing of Steam Boilers; Weighing Record, 211.

SCIENTIFIC PROGRESS.—How the Earth Might be Burned Up; Excretion of Carbonic Acid; The Electric Light; Telephones in Mines; Optograms; Glass Silk; Make Something, Produce Something; Ruskin's Idea of a Scientific Lecture; Fossil Ants, 211.

USEFUL INFORMATION.—White House White Wash; The Common Salt Glaze; Asbestos Paper; Imitations of Malachite and Other Stones; Testing Petroleum; Pavement Blocks from Slag; Patina; To Keep Tools Clean; To Make Ropes Durable, 215.

GOOD HEALTH.—Croup; Nervous Coughing; Coffee-Drinking; Over-Eating; Sugar of Milk for Diarrhea; Choosing a Physician, 215.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends; Review of the Stock Market for the Week, 212.

MINING SUMMARY for the counties in California, Nevada, Utah, Arizona, Colorado and Montana, 213-220.

GENERAL NEWS ITEMS on page 220 and other pages.

MISCELLANEOUS.—Mining Decision; The Eureka Lode; Mills at Work; Mint Coinage; The Mining Industry in Amador County; Great Red-Breasted Rail; Rapid Growth, 214. The Redington Quicksilver Mine; The Manhattan Quicksilver Mine, 215. El Dorado Gravel Mines; Mining Outlook in Kern County; A Ship Canal Through Florida, 218.

NEW ADVERTISEMENTS.

Assessment Notices—California and Arizona Mining Company; Taylor Mill and Mining Company; Mariposa Land and Mining Company; Reduction Works, Deeken & Kruse, Grass Valley, Cal.

LECTURE BY DR. DIO LEWIS.—The gentleman whose name is mentioned in the caption of this article delivered a lecture in the First Congregational church last evening on "Our Girls." It was given for the benefit of the new free library association. The church edifice was well filled. It would have been crowded to repletion had one-tenth of the citizens of Oakland known what kind of an address would have been delivered. No reporter could do justice to the speech of Dr. Lewis. It was inimitable. In its character it was serio-comic. In his personation wherein he eulogized his sainted mother, the lecturer threw himself up among the immortals. From the first paragraph to the closing sentence the remarks of Dr. Lewis were concise, incisive and thoroughly enjoyable to the large audience who had the satisfaction of listening to his address.—*Oakland Transcript.*

The whole lecture was good in every respect. By request of some of the prominent citizens, Dr. Lewis will repeat the lecture, with changes, at the same place on Monday evening next.

IMPORTED SHAD.—A shad weighing one and a half pounds was taken the other morning in the bay. This is the second one captured recently, and proves that the Pacific coast waters are perfectly adapted to the fish. The time will come, through the labors of the State Fish Commissioners, when shad will be found as abundantly in our markets as in those of the Eastern cities.

LLOYD B. BAXTER, of Scott's Flat, was killed on the 31st ult., in a hydraulic mining claim. The derrick with which he was at work fell, and forced his leg against a rock in such a manner as to cut off most of the flesh and muscles, and crush the bone between the knee and hip joints. A large blood vessel was severed, and it bled so profusely that the man died.

Economy in Working.

It is not the amount of money that a man makes that renders him wealthy, but rather the sum which he saves. He may have a very large income, but if he lets it slip through his fingers as fast as it comes it will take him a long time to get rich. It is the same in quartz mining. The mills which reduce the most rich rock are not always the ones which are most profitable. If a millman works rich rock rapidly and carelessly he is not so apt to make money as the one who works poorer rock in a skillful manner and saves everything he can. A great trouble in many of our mills is, that the Superintendent is anxious to make the mill give a good showing as regards the number of tons worked, and trusts too much to luck with relation to the percentage saved from the ore.

Some persons imagine it is an indication of ability to make a mill of certain size crush more tons of quartz in a day than another mill of the same theoretical capacity; but this does not by any means follow. By putting in coarse screens and crowding the mill it may be made to pass through a good deal of quartz in 24 hours, but that is no reason that the milling will be profitable. Another man may work less quartz but take the proper trouble to save all there is in it and he is the one that will make the most money.

In practice, of course, it makes a great deal of difference whether the mill belongs to the mine or whether it is doing custom work. If the latter, as the tailings belong to the mill (or are kept by it, which amounts to the same thing), the Superintendent can afford to use pretty coarse screens and rush the rock through, as he is paid so much per ton and it is the miners' lookout that the rock will pay; but in a private mill this same course is often carried out to the detriment of the owners. A great fault in all the metallurgical operations among us has been, and is yet, that our Superintendents do not keep accurate records of operations in the systematic manner which will serve as a guide to them in future operations. We do things in too great a hurry and pay too little attention to details. There are a great many small leaks in our metallurgical operations, which, in the aggregate, amount to more than one would suppose, but the mining community, as a class, has not put into practice the theory that economy in small things is as important as economy in large ones.

Of course there are men in charge of mines and mills among us who realize the importance of more careful work than the generality of those in the business, but as a usual thing we cannot praise our managers for the practice of economy. There is little more excuse for this in large than there is in small mills and mines; but large undertakings usually have more abundant means at hand and there seems less necessity for economy in little things. Still, on a large scale, expenses ought to be proportionately less, though, as a general thing in the business of mining, we do not find this the case. The remedy for this want of care rests with individuals more than with the class, so that all those in positions of trust and responsibility should try and set an example to their fellows, by doing as close work as possible and being economical in small things as well as in large.

California Copper.

The value of the copper interests of this coast is known to very few in the community, yet in looking over the country we find that nearly every county in California and Nevada has more or less veins of copper. The mines and ores are here in abundance but the question is what to do with the ore. New mines of this metal are discovered nearly every day, but as a general thing nothing is done with them, as we have no facilities here for reducing the ores and have to be content with shipping them all away. These shipments will no doubt continue as long as buyers at Baltimore or in Europe give a fair price for the ore, or until practical men with experience and capital take hold of the copper smelting business here.

Several efforts have been made in California to smelt the low grade ores, but the undertakings have not been successful or profitable. Miners are in about as much doubt now as to the real value of these mines as they were ten years ago, and unless the ores are of a very good grade they are worth nothing at all. When freights are high of course the freight has to come out of the miner, as then buyers pay a smaller percentage per unit in order to make up the increased charge for freights. As there are only two or three firms in this city who buy copper ores for shipment, and there is no other way of disposing of it, the copper miners, of course, have to take what they will give. They, having the pick of the market, naturally select such as suits them best, so that unless the ore is of the best quality there is no sale for it. We hope that before very long the immense copper resources of the coast will be more thoroughly utilized and that those persons who have been waiting so long will realize a proper reward. But at present, when so much attention is being paid to mining for the precious metals, it is difficult to engage the attention of capitalists sufficiently to induce them to do anything to help out the copper mining interests.

The Pacific Power Company's New Building.

Within the past few weeks the fine, large and new building of the Pacific Power Company, Nos. 19 to 27 Stevenson street, between First and Second has, been opened and a number of enterprising firms have taken advantage of the facilities offered and located themselves there. The building is of brick, four stories high, with a frontage of 100 feet and a depth of 72 feet. It is put up in a substantial manner to stand the jar of machinery, and shafting has been run in every direction so as to be convenient for the requirements of any kind of business needing power. Persons renting space are entitled to a specified amount of power without paying extra for it. The engine and boilers are very handsome, and are from the Newburg Steam Engine Works, Newburg, N. Y. The engine has three foot stroke with cylinder 18x36. It is supplied with an automatic cut-off and runs very smoothly and noiselessly. The boilers, two in number, are 16 feet long by 54 inches. They are very handsomely finished. At present only one is used, so there is considerable unoccupied space in the building. An artesian well 240 feet deep has been sunk on the lot to furnish a supply of water.

The Averill Chemical Paint Company have taken advantage of the opportunity offered by this building to concentrate their business in one place, instead of, as heretofore, having a factory and sales-room in different parts of the city. They now occupy the northwest corner of the lower floor of this new building, having the office in front and the manufactory and store-rooms in the rear. They also have a large room in the second story which is used to store materials used in the manufacture of the paint. In this room is the large mixer run by steam; from this the paint flows in pipes to the room below, where it is tinted and prepared for market. Another of these mills will soon be added to the machinery. In the lower room is a double row of large barrels, one for each of the colors made, and in these the colors are mixed and the paint properly tinted. Heretofore the stirring necessary in these barrels has been done by hand, but the barrels are to be replaced by metal tanks, and the stirring done by machinery. This will greatly simplify the work and will enable them to make the paint entirely by machinery.

The company now make their own boxes which are used to ship the tins of paint in. The lumber is purchased from the Truckee Lumber Company delivered cut in shape, so that the boxes are put together as occasion requires. We are informed that the boxes cost one-third less made in this way. The cans, of which a large number are required, are made by Locke & Montague. The paint is furnished in packages of any desired quantity, small or large. Some persons supposed that the Averill Chemical Paint Company would lose trade by moving on a back street like Stevenson, but such has not been the case. There is a short alley opening into Stevenson street from Market street, at what would be No. 527 1/2 Market, which gives direct access to the building without having to go either to First or Second street. This makes it open on the most central street in the city, and in a first-rate locality for business. The Paint Company state that their cash sales are one-third higher than when they had both the factory and store to sell from. The general sales have been one-third larger in the last month than is usual in the month of March, which indicates a good trade, especially when most business is so dull. The company paid about \$9,000 in dividends last year, and expect to do much better this. Then they had two places to keep running and furnished their own power and they save now about \$500 per month in the present locality, by having power furnished and having the business all together, with improved machinery and better facilities.

Although the whole building is not occupied there are several other firms which have taken space there already. H. E. Bothin, manufacturer of Chartres Coffee and Spices, has steam coffee and spice mills in the lower floor. The Standard Grain Sack Company, J. H. Cove, Superintendent, employs 75 girls and 10 men. W. & J. Steinhart have an overall factory and employ 30 hands. T. C. Hoffman, in the Steam Candy Works, gives employment to 16 hands. M. A. Graham, machinist, has a room up stairs. He makes a specialty of experimental machinery in wood or metal work, and pays special attention to manufacturing light articles and notions of all kinds. John F. Uhlhorn, a printer, also has space in the upper story, which is made easily accessible by an elevator. The remainder of the space in the building has not been partitioned off as yet and will be divided up to suit the requirements of those applying for space.

The North Fork mining company, at Forest City, are progressing finely with their works. They are in with their tunnel, as the San Juan Times has been informed, over 3,000 feet, and anticipate reaching the old channel before they run 100 feet further. That mining company deserves success if ever a set of men was worthy of it. The work thus far has cost a mint of money, and yet the stockholders are not discouraged.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

SUBMARINE BORING AND DREDGING APPARATUS.—William B. Hyde, Oakland. Mr. Hyde's invention is a new method of making submarine excavations. It comprises, first, an improvement in the hydraulic system of dredging, in which he uses two pumps, instead of one as heretofore. One pump forces the water through a tube against the material to be dredged, while the other is a suction pump and serves to withdraw the loosened material through an entirely separate and independent tube. Second, an improvement in the system of dredging, consisting in sinking numerous separate holes in close proximity to each other, so that the action of the water upon the bottom of the river will fill the holes with the loose material and thus reduce the general level of the bottom in a corresponding degree. The apparatus employed is peculiar in construction. The boring apparatus consists of a barrel or cylinder of the required length, through which are made two distinct and independent passages. The lower end of this tube or pipe is made flaring or bell-shaped, so that it will press upon the bottom of the bore and exclude the surrounding water. To the upper end of each passage in the cylinder is attached a pump, one of which acts as a force pump to force a stream through one of the passages against the earth in the bottom of the bell-shaped chamber for the purpose of cutting and loosening it up, while the other acts as a suction pump to withdraw the water and loosened material.

IRRIGATING ATTACHMENT FOR FRACTURE BEDS.—J. P. Beaman, S. F. This invention relates to an extension or part of a bedstead, the object of which is to provide a support and means for irrigating or supplying a constant bath of water to fractured and dislocated limbs, for the purpose of preventing inflammation of the wounded parts. This is a very convenient and comfortable arrangement, as it permits the limb being dressed without disturbing the patient or the position of the fractured parts. All the necessary conveniences for accommodating the patient are supplied.

MORE DISSATISFIED STOCKHOLDERS.—The stockholders of the Original Gold Hill mine have joined the great army of dissatisfied. A number of them, representing 1,330 shares out of the 30,000 of the old stock, which has been subdivided into 100,000 new shares, held a meeting this week to rehearse their grievances, which are manifold and hard to bear. It appears from the statements made by some of the gentlemen that an assessment of 75 cents per share was levied upon the stock a year ago, but the whole \$22,500 was not collected, it being alleged that some parties had their stock marked "paid," when, in reality, they had not put up the coin. The mine was closed shortly afterwards, and no work has been done since. The management now comes to the front again with a call for \$9,000 more, and the stockholders want to know the reason. They also desire to become informed of what became of that \$22,500, or such part of it as was paid. In order to satisfy their minds upon these points, they organized a meeting, elected J. H. Stebbins Chairman and Mr. Marvin, Secretary, and proceeded to business. After the condition of the company had been pretty thoroughly canvassed, Messrs. Stebbins, Captain Jessup, Burritt and Marvin were appointed a Committee of Investigation to examine the books of the concern and see where the money goes to.

THE GOLD HILL CHASM.—There has been but little perceptible change of late in the situation of affairs as regards the settling of the ground which occurred over a year ago a short distance east of Gold Hill, Nev. The News says that the ground on the west side of the fissure is on an average about five feet lower than on the other side. In many places along the line of the rent the solid rock is broken open to a great depth. The crevice at the present time is nearly filled up with loose earth. It extends southward from the flagstaff on Fort Homestead across a ravine a distance of about three-quarters of a mile. The monuments which were placed on the west side of the crevice by the U. S. topographical engineers some time since, have shifted in position until they are no longer reliable as furnishing data for future surveys. The body of earth which has settled to the westward in consequence of the break or opening in the ground is simply immense, and its cubical contents can hardly be estimated. In a geological or mineralogical point of view, the phenomenon referred to is well worth the study of some practical scientist.

INCREASE IN PATENTS.—A marked increase in the number of applications for patents is noted at the Patent Office, and is considered indicative of a general renewal of business throughout the country. The receipts of the office for the last month were nearly \$750,000, being \$12,000 more than the total receipts during February, and \$20,000 more than the receipts for January.

The total rainfall this season at Sacramento, has been 7.99 inches. At this time last year fully 25 inches had fallen there.

First Settlement and Early History of the "Eastern Slope."—No. 2.

Carson County—Its First Settlers and Officials—Antagonism Between the Gentiles and Mormons.

The whole of western Utah had been by the Mormon authorities at Salt Lake erected into a single county named Carson, which, as before remarked, covered the region that was afterwards organized into the Territory and is now the State of Nevada. The civil officers here provided for were few, consisting of three Commissioners, who exercised control over the general affairs of the county, a Probate Judge, in whom were reposed all judicial functions, with a Sheriff, Treasurer, Recorder, Surveyor, etc. Being appointed by Brigham Young, then and for many years after Governor of Utah, good heed was taken, as may well be supposed, that these positions should be filled by none but the plant tools of the central hierarchy and faithful adherents of the church; albeit, these Washoe Mormons who had left Salt Lake before the doctrine of blood atonement had been promulgated or polygamy come to be generally practiced, neither adopted the one nor approved of the other.

Nevertheless, they remained fast believers in the tenets of the new religion as delivered to them by Joseph Smith, its founder. To these they clung with a fanatic's zeal and a martyr's faith; being, in fact, a most desperate set of bigots, wherefore it was not at all strange that these county officials should have shown in their public acts a disposition to favor their own people to the prejudice of the detested Gentiles; or that the people themselves should on all occasions have treated the latter as if they considered them intruders, cherishing towards them a sullen dislike when it was dangerous or impolitic to manifest their hatred in a more open manner.

As the new-comers were not slow to reciprocate something of this feeling, there gradually grew up a strong antagonism between these two sets of inhabitants, which, confined at first to social jealousies and business rivalries, took at last the shape of an open feud and a determined strife for political predominance. Meantime, people of all kinds continued to arrive from California, there coming over besides the cattlemen and traders of the first epoch, a new and, to the Mormons, more troublesome class of settlers. Sharp business men, merchants and farmers, journalists, prospectors and miners, politicians, lawyers, gamblers and fugitives from justice all made their way over the Sierra, intent on sharing the business, the offices, the lands and whatever else there might be worth going after on the "Eastern slope."

With these new elements of disturbance it was not long till affairs over there culminated in serious difficulties, some of which were attended with bloodshed and loss of life.

Lucky Bill and His Confederates.

Among the earlier Gentile settlers, there were some who had sought a domicile in these far-off and secluded valleys for reasons they did not care to have inquired into, and were therefore not disposed to complain of or very sharply criticize the conduct of their Mormon neighbors, nor yet to actively sympathize with those who did so. To this class belonged William Thornington, or, as he was universally called among his neighbors, "Lucky Bill," a sobriquet conferred upon him because of the good fortune that seemed to attend all he undertook. This man owned at the head of Carson valley one of the best pieces of land in the whole country. Here he lived with his wife and son, a lad of 16 years or so, the owner of much stock, obtained, as was supposed, from traffic with the immigrants and in other legitimate ways, he being always on the alert for a trade and notoriously shrewd at a bargain. And thus he lived on, increasing in wealth, at peace with all, a favorite with the "Saints" and not unpopular with the Gentiles, because of his obliging ways and friendly disposition, until the summer of 1858, when in a fearful and unexpected manner his good luck deserted him.

Murderers and Robbers Meet with their Just Deserts.

In the spring of that year a Frenchman, owning a band of fine cattle, drove them over the mountains on the Truckee meadows, where he remained herding and looking after them. There were living at this time in Honey Lake valley, 90 miles north of Truckee, two men named Snow and Edwards, engaged in raising, buying, selling or otherwise dealing in stock. Passing back and forth, as was their wont, during the summer; between Honey lake and Carson valley, these men were led to notice this band of cattle, which being fat and well fitted for the shambles, so excited their cupidity that they determined to murder the owner and take possession of his property. Before proceeding to carry out this purpose, however, they deemed it best to take Thornington into their confidence, trusting to his shrewdness and proverbial good luck to help them successfully through with the business.

Seeing profit in the enterprise, which, under the circumstances, seemed to present few elements of danger, he agreed for a stipulated share of the spoils to help carry the nefarious scheme into execution. Having arranged matters, Snow and Edwards, associating with them another desperado, repaired to the Truckee and

dispatched their unsuspecting victim, who was living alone, and having concealed the body drove off his stock, a part of it to Honey lake, but the greater portion to Carson valley, as per contract, where it was delivered to "Lucky Bill," who, as a precautionary measure, distributed it about on his ranches, of which he owned several in the valley.

The Avengers on their Track.

Meantime, the friends of the murdered man living in California, hearing nothing from him for several months, came over the mountains to see what was the matter. Being unable on their arrival at Truckee meadows to find anything of either the owner or his cattle, they became satisfied that he had been foully dealt with, and getting on their trail soon after traced some of the animals to the possession of Snow and Edwards, at Honey lake. Snow was at once arrested, and having been tried by a jury of citizens, there being then no regular courts in that part of the country, was found guilty of murder and condemned to be hung, which sentence was forthwith carried into effect.

Lucky Bill Arrested and a Little Strategy Resorted to.

Edwards, getting timely notice of the threatened danger, escaped to Carson valley, where he was for a time kept concealed by Thornington. But the people there, whose suspicions had long been aroused, on hearing what had transpired at Honey lake proceeded to arrest "Lucky Bill," and, having extemporized a court, tried and convicted him of murder and sentenced him to be hung. Believing that Edwards was secreted somewhere in the valley and that Thornington and his son knew his place of concealment, the condemned was granted a respite and recourse had to a little strategy to aid in effecting his discovery. Addressing themselves to the hopes and fears of the boy, he was given to understand that the life of his parent might be spared if his accomplice could be found. The instinct of paternal love prevailing, he imparted to those having the matter in hand the desired information.

The Fugitive Entrapped and Sent to His Doom.

Now, Edwards, being a powerful young fellow, well armed, and rendered desperate by the

tuted authorities. To this course the most of the Gentile population strenuously objected, well knowing that a trial by a Mormon court would amount to nothing. To set him free altogether was not to be thought of, as there were grounds for suspecting that the culprit had been engaged in robberies, if not also in murders before; as there were no jails in the country, wherein to confine him, it was deemed best that the sentence of death, already passed upon him, should be carried into effect. This settled, the unfortunate man having been granted sufficient time to dispose of his earthly affairs, was taken to Clear Creek ranch, at the foot of Carson valley, and there executed in the presence of a large concourse of people. Thornington bore himself throughout these trying events and even to the last, with a coolness and nerve that denoted the possession of very superior qualities and excited the admiration of those who had been most active in procuring his condemnation and punishment. Indeed, every one of this guilty trio, the fourth having made good his escape, manifested a self-possession and courage that won for them the respect of a community so largely composed of rough and daring men, and even gained for them the commiseration of many. In fact, the execution of Thornington, instead of harmonizing tended to further divide public sentiment, many of the Gentiles considering his execution such a breach of good faith as warranted them in withdrawing their support from what was termed the "Vigilance" party, and thus new issues and factions sprang up, keeping the inhabitants in such an unsettled and excited condition that they began to think seriously of a separation from Utah and the organization of a new Territory out of that portion thereof embraced within the limits of Carson county.

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective superintendents on file at the offices in this city.

In the California mine the double track and switches are all completed on the 1650-foot

RITTINGER'S DOUBLE CONCUSSION TABLE

situation, his capture, unless he could be thrown off his guard, or in some manner attacked at a disadvantage, would necessarily be attended with a good deal of peril to those undertaking it; wherefore the lad was further required to lure him from his lurking place under the pretence that the father wished to meet and confer with him at another spot, Edwards not as yet being aware of Thornington's arrest. To this also the poor boy agreed and proceeded alone in the night to a solitary place in the mountains, from which a good outlook could be had of all that was going on in the valley below, and there meeting the fugitive, told such a plausible story that, after much hesitation, the latter consented to accompany him to the spot designated, telling him that if he found anything wrong he would kill him on the instant. With this understanding the two came down into the valley, crossing which they repaired to a ranch owned by "Lucky Bill," at the forks of Carson river, Edwards, who it seems entertained a fear all the while that this might be a ruse to decoy him into the hands of his enemies, keeping the boy before him covered with his revolver. In this order they advanced up a narrow lane and approached a hut standing among the willows, and in which a party of well-armed men had already been concealed. Having reached the hut Edwards paused and listened for a time, when, hearing nothing calculated to excite his fears, he pushed open the door and entered. The instant he crossed the threshold he was struck down with a club, and before he could make any use of his knife or pistol, one held in each hand, he was overpowered, secured and at once delivered into the custody of a guard from Honey lake, who, hurrying him off to that place, he was tried, convicted and hung by a vigilance committee, as his guilty companion had been before him.

And his Consort in Crime Follows After.

What to do with "Lucky Bill" was a question that now puzzled his custodians and captors. Many believed that after this implied promise of leniency he should not suffer extreme punishment. A few, among whom were his Mormon neighbors, thought he should be allowed to go altogether; or, if anything further was to be done, that he should be handed over for trial and punishment by the legally consti-

What California Has Not.

Sometimes it is easier to describe a thing by what it is not rather than by what it is. Thus when a man is possessed of many virtues it is easier to enumerate his few faults. This must be the philosophy of the gossips and fault-finders, although we never thought of their behavior in that light before. We have had such a long task in telling the many good things which have thus far been discovered in California, that we are not loth to take the other side and finish up the description by telling what California has not. The beauty of the whole matter is, too, that in our abundance we have not missed the trees and plants which Dr. Gray, in his writings about Darwinism, says do not grow naturally in California. It is true that we knew some of them were not here indigenous, but so many have been introduced and so many glorious substitutes exist, that to stop and mourn for what we have not is senseless as to forget the salmon which lies in our basket and cry for the shiner which wiggled off the hook. This is the worst which Dr. Gray can say of us: "California has no magnolia, tulip or star-anise trees; no so-called papaw (*Asimina*); no barberry of the common single-leaved sort; no podophyllum or other of the peculiar associated genera; no nelumbo or white-water lily; no prickly ash or sumach; no lobloby bay or sturtia; no basswood or linden; neither locust, honey-locust, coffee-trees (*Gymnocladus*) nor yellow-wood (*Cladrastis*); nothing answering to hydrangea or witch-hazel, to gum-trees *Nyssa* and *Liquidambar*, *Virburnum* or *Dierroilla*; it has few asters and golden-rods; no lobelias; no huckleberries and hardly any blueberries; no epigea, charm of our earliest Eastern spring, tempering an icy April wind with a delicious wild fragrance; no calmia or clethra, or holly or persimmon; no catalpa-tree, or trumpet-creeper; nothing answering to sassafras, or to benzoin-tree, or to hickory; neither mulberry nor elm; no beech, true chestnut, hornbeam or ironwood, or a proper birch tree; and the enumeration might be continued very much further by naming herbaceous plants and others familiar only to botanists."

Mechanical Ore Concentration and Separation—No 28.

[Written for the Press by FRANCIS M. F. CAZIN, M. E., Santa Fe, New Mexico.]

Rittinger's Double Concussion Table.

The illustration on this page, drawn from a photograph, represents the most perfect form in use of this very effective apparatus. It consists of four tables, with one gear for motion. The percussion is imparted sideways. I shall not give a special description of its operation, as it can be found in Guido Kuestel's "Treatise on Concentration," (published by the proprietors of this paper,) a book which, though eight years old, is well worth study for all who take an interest in its object, and one which contains much useful information not as yet collected in any other work in the English language.

No Answer.

MESSRS. DEWEY & Co.—Gents: The advertisement you inserted for the Western Gun Works, Chicago, Ill., in the MINING AND SCIENTIFIC PRESS, I pronounce as a fraud. I have sent them the requisite amount of money they called for in premium certificate (March 6th), but as yet no long range revolver has been received, nor is it likely to come.—D. D. O'HARRA, Wells, Nevada, March 20th.

We have been very cautious in publishing such advertisements in the Press, and think our readers will have to look very sharp to find them hereafter, as we do not mean to make many such slips. However, when such mistakes occur, we are willing to rectify them as far as lies in our power, as we do in this case by giving publicity to the above letter.

GRASS VALLEY MINES.—The reports of the situation of the mines in Grass Valley are very encouraging. In our Mining Summary will be found a good summary of the situation there from the Grass Valley Union. In concluding that paper says: A reporter of ours went over the hills yesterday and he says that there are prospectors to be found everywhere. Many of them will positively refuse to tell what they are realizing from their work. The reason for such a refusal is not apparent. They may have the same feeling that the reporter of this paper has, when writing up the mining situation. The reader may believe that there is an exaggeration in the matter. We must acknowledge that our account of the mines of this place looks rose-colored, and yet we have not said a word in that connection but what is strictly true. We get our information from the best sources and the statements we have made can be relied upon.

THE west-bound passenger train collided with an east-bound freight train on the mountain division of the Central Pacific railroad near Cascade, about 12 miles this side of the Summit, at six o'clock on Wednesday morning. Two engineers and two firemen were killed, but no passengers were injured.

NEARLY all the Reading Railroad engineers will leave the Brotherhood and continue work.

El Dorado Gravel Mines.

The editor of the El Dorado Republican has been taking a run among several mining claims in the county, and over a section which he had not previously visited. He says:

The first claim that we encountered was that of Salter & Hancock, at Negro hill, about two and one-half miles east of town. This claim has been steadily worked for many years and is still paying handsomely, but it is now the roughest and most dangerous looking place to mine in that we have ever encountered. The bank, from the bedrock, is about 150 feet high, and the pay is on the bedrock, with the toughest kind of gravel cement above. This has been honey-combed at the base, until many feet back has given away and slid down in all manner of shapes, in blocks that would weigh from a hundred to millions of tons, leaving extensive fissures beneath them, where the work is now being done. We crawled around among intricate passages and finally came to a partially open area, where Mr. Salter with two other men were engaged in cleaning bedrock. The dirt taken out there pays immensely, probably \$100 to the ton. The bedrock is scraped and then the dirt is hydraulized out through a tunnel. In various places through the chasms we noticed the tops of peach trees protruding through crevices in the rocks, in full bloom. These trees had been carried, some of them years before, from Frank Plunado's orchard by the caving of a bank.

On the north side of the hill there is a vast belt of gravel owned by the same parties, out of which vast sums have been taken, and in which millions of dollars will yet be taken. These gentlemen now own nearly all the really valuable mining ground on what was once well known as a rich mining camp, Negro hill, of late years better known as Reservoir hill. Mr. Hancock also owns a fine ranch in the vicinity. From here we wended our way to White Rock, and the day being well advanced, had only time to visit the claim of Vineyard & Hancock, which they are now engaged in opening. It has been thoroughly tested and they know that it is good. They are now engaged in running a tunnel for a flume leading into the claim, and will soon be running out the hill above through it with 400 or 500 inches of water. The ditch company have a claim adjoining it, upon which they are not at work, but have the most ample water facilities, with a reservoir close by that must have cost several thousand dollars. There are several claims in operation around White Rock, but we had not time to visit them. We made a short halt at the Oak Ranch mine, and found that they had just struck good pay gravel in the deep channel at a depth of about 185 feet.

Mining Outlook in Kern County.

Operations on the Big Blue or Summer mine, at Kernville, have been for the last few months partially suspended, and the usually large force employed greatly reduced. The management in the meantime has been engaged in opening new leads and placing the mine in a condition fit for more successful and extensive operation. As a consequence, the most flourishing and populous mining town in the county has been suffering a spell of dullness, from which it is now confidently predicted she will speedily emerge. The late prospecting operations in the mine have developed some very gratifying results, and 12 feet of good ore has been found in the bottom. We learn that it is the intention of the management to resume operations about the 25th inst., and employ a force sufficient to keep the great 80-stamp mill running to its full capacity. For this purpose probably between 200 and 250 men will be required. It is said too that this mine has never been in such good condition before, or so capable of making rich returns. With a new and promising future opening, Kernville will soon resume her old-time prosperity.

The Bunnell.

It was hoped that this famous mine would by this time have begun to make returns that would speedily establish its claim as the successful rival of the Comstock bonanza. It was too much, however, to expect that the work of opening and developing the mine could be hastily accomplished. It has run the usual ordeal of litigation, and fortunately escaped without ruining its owners and at no great sacrifice of time or money. With just and judicious management now, there is no apparent reason why it should not shortly make floods and O'Briens of every shareholder in it. It has a complete 20-stamp mill and all the appliances necessary for the reduction of the class of mineral that is found there. A well defined lead of very rich rock four feet wide is revealed by the work already done. In the lower level, however, where this vein has been reached the water has become troublesome, and it is necessary before the mine can be opened to any advantage to overcome this obstacle. There are two ways of accomplishing this object. One is by draining from below, and the other by pumping from above. The former method is considered the most feasible and economical, as well as the most satisfactory and sufficient. It is therefore determined to go down the mountain several hundred feet and run another tunnel into the lead. It will be an easy matter then to effectually drain the upper levels and the lead will be prospected at a greater depth. This will be cheaper than the employment of expensive pumping machinery, at all times liable to break and frequently requiring repair. The water in

the creek is so low now too that there is not sufficient to run the mill, and it is therefore deemed better to place the mine in good condition for profitable and successful operation when the water does come.

The Erskine Mines.

Reports from the Erskine mines are to the effect that some work is being done, enough to keep the arastras running, but that there is no immediate prospect of the erection of a mill, or rather that the parties expect to extract enough by means of the arastras to erect a mill. Unless the rock is fabulously rich and easily worked, it is to be feared that it will be some time before enough can be realized by that process to erect a mill. The Erskine creek mines are known to be very rich, some specimens of rock from them assaying as high as \$2,000 to the ton. It seems strange and a pity that these mines should be permitted to remain neglected when they would so richly repay working. We trust they will not remain long unproductive, and we are encouraged in this hope by the fact that they have, according to report, recently fallen into enterprising hands.

Mining operations about Havilah received some impetus last spring; sufficient to justify the hope that that once flourishing camp was about to regain her ancient prestige and prosperity. But later developments have dispelled these hopes. There is still some work done there and Mr. Stretch is running one mill. There are many leads in the vicinity of Havilah that it is believed would handsomely repay working, although there is no great money in them. With cheap freights and reduced price of labor there would seem to be no reason why they should not be profitably worked.

A Ship Canal Through Florida.

An engineering project of considerable interest contemplates the building of a canal through the peninsula of Florida, in order to effect the junction of the Mississippi river and the Atlantic ocean. The project in question was presented at the meeting of the International Geographical Congress, and was there most favorably commented upon. Nature has already provided the greater part of the route, and the obstacles to be overcome are easily within the skill of the engineer. The proposed route is described as follows: From New Orleans to St. Marks in Florida, a series of lakes, lagoons, water-ways, all navigable, extend along the coast, separated here and there, at long intervals, by low necks of land, requiring but little more than skillful dredging to open the route to the Suwanee river in Florida. From the Suwanee to the Great St. Mary's river, which, from the proposed point of junction, pours its stately flood, unimpeded by rock or shoal, into the Atlantic ocean, near the southernmost point of Cumberland island, the distance is only 30 miles. By this plan, and at a moderate cost (for the canal would only need to have a depth of from seven to eight feet to float the largest steamers or craft frequenting these rivers) 20,000 miles or rivers and navigable waters, already swarming with craft and eager for commerce, will be opened up, and, to use the words of one of the enthusiastic advocates of the enterprise, "The Southern planter or the Western Granger from the remotest district, will be enabled to ship their produce by the easiest and cheapest mode of transportation known to commerce, and without breaking bulk to ocean-going steamers and shipping of any tonnage, lying in the safe harbors and anchorage of the Atlantic coast, thus avoiding all the dangers now incident to the navigation of the Bahamas, the reefs of Florida, and the Gulf of Mexico."

Don't trifle with a poor watch when you can buy a good one of Dewey & Jordan, 433 Montgomery street, San Francisco, at prices according to the times.

THE MINING AND SCIENTIFIC PRESS was established in 1860. It is the only scientific and the only mechanical journal in the Pacific States; circulates largely in California, Nevada, Oregon, Idaho, Montana, Utah, Arizona and Colorado, among the most influential professional and intelligent industrial classes; it is read and filed in the manufacturer's office, the shop, the mill, the miner's cabin and mechanic's home; the population in its jurisdiction—now rapidly increasing—is thrifty, enterprising and "building up," with better times than prevail in other quarters of the Union.

HYATT'S LIFE BALSAM.

As a conqueror of Rheumatism, Gout, Neuralgia, and cure for Scrofula and all diseases arising from impurity of blood, the old and reliable Family Medicine, Hyatt's Life Balsam, stands unequalled, as proven by over 300,000 great cures during the past 30 years. Is a radical vegetable compound of Sarsaparilla, Dock, Guaiacum, etc., and is permanent cure. Sold by all druggists and country grocers. Take nothing else, and if they haven't it we will send by express, boxed, everywhere, at \$1 and \$1.25 per bottle; \$5 and \$6.50 half doz. Hyatt & Hyatt, 246 Grand street, New York.

Steam Engines & Boilers.

NEW AND SECOND-HAND.

One Patent Straw-Burning, Portable Engine, (new,) fire box boiler, the best Portable Engine on the coast; built by Ransom, Sims & Head, Ipswich, England.
 One Steam Fire Engine, second-hand, in excellent condition, with 200 feet leather hose, very cheap, just the thing for a small town. Button & Blake, builders, Waterford, N. Y.
 One second-hand Stationary Engine, 14x30 inches, link motion, with or without hoist gear.
 One second-hand Stationary Engine, 8x20 inch, with or without hoist gear.
 One Upright Boiler, Horizontal Engine on wheels, Eastern make, 7x12.
 One Upright Boiler, Horizontal Engine, San Francisco make, 6x12.
 One small Stationary Engine, 3½x7 inch.
 One Steam Boiler, 40 inches diameter, 16 feet long.
 One 8x10 Straw-Burning Portable Engine.
 One Stationary Engine, 8x16, and Boiler, with pump heater, fire front and smoke-stack, complete.
 One Traction Engine, three wheels, rubber tires, double cylinder, 6x10 inch; Thompson's patent, D. D. Williamson, builder, New Jersey.
 Various other second-hand Engines and Boilers for sale cheap.

J. W. RILEY,
 P. O. Box 2361. San Francisco.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 10.

The Ingersoll Rock Drill

Is Extensively Used in the East and
TAKES THE PLACE OF ALL OTHERS.
Wherever introduced, because it can be run with less power, labor and repairs, and do more work than any other Drill in the market. It has but few parts, is easily handled, being light, and has AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to

J. B. REYNOLDS,
(Room 10,) 320 Sansome Street

THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at \$3.	\$12.00
Two firemen at \$4.	8.00
1,500 lbs of salt at 15c.	22.50
Wear of shoes and power.	1.50
Cost for 15 tons:	\$44.00
Cost for one ton:	2.93 1/3

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,
Reno, Nevada.

Leavenworth, Kansas.

French Savings and Loan Society,
411 Bush Street, above Kearny, SAN FRANCISCO.
G. MAHE, Director.

THE ASBESTOS PATENT FIBER COMPANY,

Of Philadelphia, offer for sale through their agent in San Francisco,
Asbestos Steam Packing, Asbestos Boards and Asbestos Steam Joints,
All manufactured from the pure utilized Asbestos Patent Fiber, and under patents granted to J. S. Rosenthal. The packing is in all sizes from one-quarter to three inches in diameter, round, and free from all grit or mineral matter. The non-utilized or crude Asbestos, manufactured by some parties into packing, is impure and gritty, liable to injure the piston rod and should not be used. The packing made under the Rosenthal patents is of pure utilized Asbestos fiber, and a very superior article and entirely different from the so-called Asbestos packing heretofore offered for sale. It is compact in form, will not fuzz or disintegrate, and will wear much longer than any other kind of packing. The indestructible, expanding, contracting and lubricating qualities of Asbestos are now universally recognized, and packing made from it is peculiarly adapted for steam engines and pumps.

ASBESTOS PATENT FIBER BOARD.
This is the champion non-conductor, to prevent radiation of heat and condensation of steam, as covering for marine, stationary, or locomotive boilers and pipes, and for lining wood-work, where exposed to great heat. It is light, flexible, is not disturbed by vibration, and will not char or crumble. The sheets are 30 by 44 inches, of any desired thickness, and are easily applied.

ASBESTOS PATENT FIBER STEAM JOINTS.
Indestructible by fire or water, expands and contracts in a desirable manner, adjusts itself to any rough point, is cheaper than rubber, and in all respects a superior article. PURE ASBESTOS FIBER for packing steam governors and other purposes. All these goods are extensively used in the Atlantic States and give general satisfaction.

Also, For Sale by
DUNHAM, CARRIGAN & CO.,
107 & 111 Front Street.

Webster's Unabridged.

3,000 Engravings; 1,840 Pages Quarto. Price, \$12.
A NEW FEATURE.
FOUR PAGES COLORED PLATES.
The National Standard.
PROOF, -20 TO 1.

The sales of Webster's Dictionaries throughout the country in 1873 were 20 times as large as the sales of any other Dictionaries. We will send proof of this on application, and such sale still continues.

More than **THIRTY THOUSAND** copies of Webster's Unabridged have been placed in as many Public Schools in the United States, by State enactments or School Officers.

Webster's Dictionary has been recommended by State Superintendents of Public Instruction in Eastern, Northern, Middle, Southern and Western States, -TWENTY-EIGHT in all.

Can you better promote the cause of education and the good of community than by having a copy of Webster's Unabridged in your family, and trying to have a copy in each of your Schools?

Webster now is glorious,—it leaves nothing to be desired. [Pres't Raymond, Vassar College.]
A very scholar knows the value of the work. [Dr. H. Prescott, the Historian.]
Believe it to be the most perfect dictionary of the language. [Dr. J. G. Holland.]
Superior in most respects to any other known to me. [George P. Marsh.]
The standard authority for printing in this office. [A. H. Clapp, Government Printer.]
Exceeds all others in giving and defining scientific terms. [President Hitchcock.]
Remarkable compendium of human knowledge. [W. S. Clark, Pres't Agricultural College.]

ALSO,
Webster's National Pictorial Dictionary,
1,040 Pages Octavo. 600 Engravings. Price, \$5.
Published by G. & C. MERRIAM, Springfield, Mass.

ARITHMETIC MADE EASY. ROPP'S EASY CALCULATOR

Is a new publication that must prove of incalculable benefit to Farmers, Mechanics and Business Men. It is so rapid and original as to startle the most scholarly, and yet so simple and practical that the most illiterate in figures can instantaneously become his own accountant. It enables thousands to accomplish in a minute what they could not learn to calculate in many months.

The first part contains an entirely new system of tables, which show at a glance the exact value of all kinds of Grain, Stock, Hay, Coal, Lumber, Merchandise, etc., from one pound up to a car load, and for any price that the market is likely to reach; the interest on any sum for any time at 6, 7, 8 and 10 per cent.; correct measurement of all kinds of Lumber, Saw Logs, Cisterns, Tanks, Granaries, Bins, Wagon Beds, Corn Cribbs; a Time, Wages and many other valuable tables.

The second part is a practical arithmetic, and embodies a simple mechanical principle which enables any one familiar with the fundamental rules to become a lightning calculator; and by which over two-thirds of the figures and labor required by the ordinary methods, and fractions with their intricacies, are entirely avoided.

The work is nicely printed on fine tinted paper, is well and elegantly bound in pocket-book shape and is accompanied by a Silicate Slate, Memorandum and Pocket for papers. It is by far the most complete, comprehensive and convenient pocket manual ever published.

Price, bound in Fine English Cloth, \$1.00.

Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter, or receipted by express. Address

DEWEY & CO., San Francisco.

Mechanics' Mills, Mission Street,

Bet. First and Fremont, San Francisco. Orders from the country promptly attended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners, Billiard Balls and Ten Pins, Fancy Newels and Balusters.

Continued from page 213.

any in Maynard district, the shaft is down 150 feet. A tunnel is being run which will tap the vein 100 feet below the bottom of the shaft, and is rapidly approaching completion. This is a bold, 12-foot vein, and the ore is of high grade, free and easily reducible by milling process. There will be a prosperous camp in the vicinity as soon as the company who owns the mine put up their mill, which we understand they will soon do. The Silver Glance mining company are hard at work developing their mine, and everything is in preparation for an extensive run upon their furnace. This company gives employment to about 50 men. On the San Francisco mine upon the McCrackin, the work of development is being rapidly pushed and the company will soon erect a 10-stamp mill for the reduction of the ore from this mine on the Sandy, four miles from Fish's springs.

Colorado.

ORE.—Colorado Miner, March 24: The ore market during the present week has been slightly depressed, under the unfavorable quotations from England. The production of the mines, on the other hand, has more than made up the deficiency in prices, and everything gives token of a prosperous season.

THE HUKILL MINE.—Among the great deposits of argentiferous ore in this country, the principal lode, owned by the Hukill silver mining company, ranks among the first and best. The lode is situated about a mile and a half west of Idaho Springs. Crossing the mountain at right angles, the mine can be worked for years by the four levels already started on the vein, without recourse to deep shafts and hoisting machinery, when these are required. Clear creek can then furnish power enough to sink 1,000 feet deeper, before an engine is needed. In its facilities for cheap transportation of ore, timber and supplies, the location of the mine is surpassed by none in Colorado. When the Colorado Central railroad shall have been extended to this point, ore may be dumped from the levels into the cars that will transport it to the best markets this State affords. The outcroppings of this vein are very strong, and gave promise on the start of great treasures below, which subsequent working and development more than verified. It has been opened by shafts and crosscuts for a distance of over 1,300 feet, everywhere showing a continuous vein of mineral. Four levels have been run, and nearly 800 feet of shafts and winzes sunk, showing an average width of ore vein of over two feet, and an extensive bonanza five feet wide of solid mineral. In this work of development 1,700 tons of ore have been produced at a profit of over \$24,000. But little stoppage has been done, and the reserves of ore in sight are estimated by the most competent mining engineers as certain to yield half a million dollars. The average value of the ore mined has been \$114.82 per ton. At the surface of the lode gold predominated, but as depth is gained the amount of silver increases and eventually becomes the most valuable product.

Montana.

SHUT DOWN.—Butte Miner, March 21: The Centennial mill for several days last week was shut down, owing to the supply of ore on hand having been exhausted and the bad condition of the roads making it difficult to obtain any from the mines. This is the first stoppage of the mill of any duration that has taken place since it has been under the new management.

THE DEXTER MILL is running on small lots of medium grade ore, picked up at various mines where limited operations are carried on. A small shipment was made on Wednesday.

MINING operations are now being prosecuted right in the heart of the town. A claim running diagonally from Main street to Montana avenue and crossing Park avenue just west of the bridge, is being represented by one of the original locators, who is engaged in sinking holes on the ground occupied for school purposes, the same being embraced in the Diadem mining claim. The owners have no disposition to interfere with property holders, but are simply representing a claim that has every indication of proving a valuable lead.

THE LEXINGTON now employs 27 hands, a greater number than at present is employed upon any other mine in this camp. This mine is engaged in driving a shaft, the direction of which are now being run, and in taking out ore which upon an average amounts to 12 tons per day. The vein still holds its width as far as the levels have been run and the ore averages about the same, being a medium grade with a strata, a few inches in width, which assays away up in the hundreds, and now being mixed with the lower-grade ore makes an average which is desirable for milling purposes.

Two bars of silver were received by Donnell, Clark & Laramie from the Monroe company's mill, at Dewey Flat. It was the product of a small lot of custom rock worked at that mill. These bricks were valued at \$1,500. The Monroe mill is now running regularly, having had all the needed alterations to it completed, and from this time shipments of bullion can be expected to follow at regular intervals.

The Davis mill has been running constantly during the week, with the exception of a half day spent in cleaning the boiler and overhauling the belts and machinery. Everything about the mill works satisfactorily. The extremely low grade of the ore which at first was treated, has all been run through and a higher grade is now being crushed, which will increase the bullion yield. There is considerable amalgam now on hand.

MESSRS. DONNELL, CLARK & LARAMIE purchased last week, for shipment to Baltimore, 40 tons of copper ore from the lessees of the Discovery claim, on the Parrott lead. The ore samples nearly 40%, and was taken from the lower level in the mine.

Utah.

BEAVER COUNTY ITEMS.—Salt Lake Tribune, March 31: The three smelters in San Francisco district are now running full blast, and the prospects are that they will continue to do so for some time to come. A new saw mill is in active operation in San Francisco district, run by Mr. Kidder, from Cottonwood. The desert lands are being redeemed by use of the artesian wells and windmill pumps in Beaver valley, the the Douglas and the Uncle John claims, the two most promising prospects in the canyon were mentioned. The owners of these prospects were all poor men, and could not afford to push the work on their claims with any considerable degree of vigor, though they kept sufficient work done to hold their property under the law. About two weeks ago, however, several old miners, Messrs. George Edington, J. P. Spaulding, Luke Shuman and others went prospecting for a new mine in the foothills above the city cemetery, and were lucky enough to strike a good one. They located 1,500 feet, naming it the Geo. H. Nettleton mine, having first sold a half interest of it to O. H. & J. F. Earl. Yesterday morning the report of this sale and the further rumor that the same parties had struck a rich silver bearing deposit near the same place created considerable excitement. Indeed, those who heard of the strike on Wednesday evening, started for the new El Dorado at 4 o'clock yesterday morning, fearing that some one would get in ahead of them. By 10 o'clock in the morning a large number of mining men had gazed upon the 400 pounds of gray sandstone which had been left in the Walker house

on exhibition. The rock appeared as unpromising as anything which comes from Leeds, but the assays made from it showed it to be rich. One assay, made by Mr. Frank Foote, went \$357.66, and Mr. Earl claimed that two other tests gave results of over \$600 and \$1,100 respectively.

PATENTS AND INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING MARCH 20TH, 1877.

- 188,475. STOVES FOR HEATING SAD-IRONS.—R. Martin, Portland, Ogn.
188,494. COMPOUND METAL-WORKING MACHINES.—R. Bandhauer, Denver, Col.
188,540. CONVICT SHACKLES.—J. L. Quackenbush, Portland, Ogn.
188,568. ATTACHMENTS FOR INVALID BEDSTEDS.—J. P. Beaman, S. F.
188,587. ORE FEEDERS FOR QUARTZ MILLS.—G. A. Church, Nevada City, Cal.
188,647. AUTOMATIC FEEDERS FOR FURNACES.—E. F. Littlepage, Los Angeles, Cal.
188,652. SINK AND SEWER TRAP.—J. H. Mackie, Oakland, Cal.

FOR WEEK ENDING MARCH 27TH, 1877.

- 188,731. INSIDE BLINDS.—A. T. Elford, Oakland, Cal.
188,733. BOILER FURNACE.—E. Fair, S. F.
188,748. WINDMILLS.—J. Lochhead, S. F.
188,752. LIFE BOAT.—C. Dickinson, Portland, Ogn.
188,848. MACHINE FOR SETTING THE TEETH OF SAWS.—A. Boisset, S. F.
188,888. CORN PLANTER.—C. S. Goethals, Los Angeles, Cal.
188,910. TRACE BUCKLE.—T. J. Hubbell, Yountville, Cal.
188,940. DRAWER.—A. Packescher, S. F.
188,957. SEED PLANTER.—H. J. Robinson, Carpinteria, Cal.
188,992. CIGAR-HOLDER.—F. H. W. Von Tiedemann, S. F.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

From Our New York Correspondent.

The Institute of Mining Engineers lately held in New York a meeting, which cannot be considered as great a success as the majority of its predecessors. Hitherto the society has enjoyed the supervision of Presidents who were always active members of the profession and well acquainted with the questions mooted in its circles. This time the President (Mr. Hewitt, member of Congress), was absent on political duties, and though the chair was occupied by a gentleman who may fairly be called the most popular member of the society, the repeated absence of the elected President from his duties during the past year was frequently remarked upon. The fact is that personal distinction goes but a very little way with Americans. It seems to be quite possible to organize very successful societies in England under the leadership of men who owe their selection to social prominence. But in America the humblest man can win success and eclat for a society by giving its welfare his judicious attention, while the most noted character in the world cannot counteract the effect of inattention and carelessness.

In the matter of papers the meeting was, as usual, rich and varied. Mr. W. M. Curtis, of Wyandotte, Michigan, who was not able to be present, sent a paper on the silver and other mines of the north shore of Lake Superior. He does not give a very flattering picture of the region. The famous Silver Islet mine is in trouble, as every one knows, and the deposit is so irregular that the managers have little hope of discovering a rational and certain method for finding new ore bodies. The diamond drill has been used, and is to be used in future, and, if money can be raised the shaft will be sunk 300 feet further, but the outcome of these explorations offers nothing certain, or even assuring. When this mine reached the end of its rich deposits the bottom fell out of the whole lake country, so far as its wonderful silver deposits go. The forbidding climate counteracted the seductive influences of the extraordinary mine in the days of its prosperity, and now that it has lost its good fortune the region finds that it has made no real advance, but goes down with the fall of its sole leader.

Speaking of Lake Superior I may mention that preparations are made by several parties to visit that country on professional and scientific journeys. The Institute of Mining Engineers has in contemplation a two-weeks' trip and continuous meeting on a steamer chartered for the purpose. The Council has authority to postpone the annual meeting from May to July for the purpose, if desired. Cornell University proposes to send out an ambulatory school of science to spend six weeks on the great lakes, the students to pay close attention to the animal and plant life of the lakes and their shores.

The Institute occasionally has opportunity to examine curiosities laid before it. Prof. Munroe, of the Japanese School of Mines, brought to this country two bell-shaped articles of copper, one about 18 and the other about 36 inches high. They are not round but oval, and as they exhibit no sign of wear, either on the edge or the ring by which they would be hung, Prof. Eggleston suggested that they might have been used as caps for minarets on a temple. This view is further strengthened by the fact that the castings are thin and full of sand holes, and never could have given a good sound. The in-

terest attaching to them is due to the fact that they are pre-historic; the present inhabitants of Japan dig them out of the ground and have no idea who made them, or what their use was.

Among the results of the Centennial exhibition was the gift to the Institute of a large number of mineral and metallurgical collections which had formed the exhibit of foreign and home establishments. The full number of these is not yet known. Eighty-four were reported at this meeting, and this is said to be about one-third of the gifts. Among those enumerated, Russia gives three suites of copper ores, mattes and slags, from the famous works of Prince Demidoff and the Ural, seven of iron, one of zinc and one of coal from southern Russia. Prussia contributes seven, Sweden six, mostly iron and steel, Spain, Portugal, Italy and Austria one collection each of their copper, lead and iron ores, and fuels. Belgium gives specimens of her zinc-bearing galena, the treatment of which has given rise to the admirable works for concentrating and smelting these compound ores at Bleiberg. England has five suites, mostly iron and steel, and the British provinces, Victoria, South Australia, Tasmania, New Zealand and Queensland, each sends one, the dominion of Canada three, Nova Scotia one. Brazil and Mexico present one each. Of American (that is United States) works, there are 41 in the list so far as reported. Besides all these, a number of valuable models and apparatus have been left on deposit.

Now of what use can all this be? No occupation is, or perhaps can be, duller, than looking at very sober-faced pieces of stone and slag, placed behind glass doors. Still, there is one use to which these collections can be put—they can be used for teaching. Every one of these specimens represents work actually done, and a skillful teacher can use them to give his lectures an air of reality. In fact, professional instruction is not worth much unless it is reinforced by this kind of object teaching. At present these collections are not likely to be applied to any use of this sort. They are housed in memorial hall, which all the visitors to the exhibition will remember as the art gallery. It is to be hoped that a more worthy destiny is in store for them. In that place they can only sink steadily into uselessness, as the processes they represent are superseded by new methods, as is the way of all progressive industry.

But, leaving this field of dry professional details, let me tell you that the great city of New York has its phases of change as well as all other things earthly. This year is especially marked in this respect, and the peculiar tone which has been given to the part of social activity of which I am about to speak, is not the invention of modistes and fashion makers, as is sometimes the case. It is but a manifestation of the inevitable. The times have been hard, most of the citizens are poor, and, as is but natural in such times, this has been a great season for auction sales. Artists have felt the pressure with peculiar severity. The most renowned have suffered, and all but these few famous ones have had hard work to keep on their (professional) feet. They have resorted to the auction rooms in great numbers, and many a man who has made it a point to keep his work out of Liberty street has this year deliberately stripped his studio walls and sent all the pictures he had to the auctioneer. The movement began about six weeks ago, and the consequence has been a lenten season of very peculiar character.

The devotees who, in ordinary times, take their pleasure at the theaters, parties and balls, denied these gayeties, have resorted to the auction rooms. The audiences have been composed of the best people in the city, and nowhere could more beauty and refinement be found than among the crowds of ladies who shook their handkerchiefs in rapid succession while the auctioneer put up one object after another. Nor has there been any pretension about these sales, as there was about the auction of Mr. Johnston's gallery, when the bidders went in full dress. Thousands of pictures have been sold, and the auction fever became so marked that advantage was taken of it to put several fine collections of books upon the market. But the most noticeable result has been in the sales of what are called, in auctioneer's cant, "curios." The rage for buying at auction happened to coincide with another rage for expensive pottery, enamels, Persian, Turkish, Chinese, Japanese and other work of any kind, provided it were artistic and dear. Of course nothing could be happier for the auctioneers. Sale after sale has been had, wares of the kind mentioned have been put up in such quantities that you would think they had been imported for the purpose by the cargo.

The truth is they have been so imported. Dealers in these things are very shrewd, and there can be little doubt that they had prepared for a descent upon the pockets of New York's rich men. The fact that their maneuver coincided with a temporary auction mania was quite accidental. But in addition to their goods, several private collections have been brought forward and sold. The opportunities for buying objects of present fashion and real artistic value have never been better. Prices have sometimes been extraordinary, but at most sales they were moderate. The upshot of the whole is that New York in this dull year has invested some millions of dollars in auction goods.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quicksilver.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniures, and Gold and Silver Ores generally, with 120 Lithographic Diagrams.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

UNITED STATES

Mineral Land Laws, Revised Statutes, AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, postage free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

Mining and Scientific Press.

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents. As an

ADVERTISING

Medium for the Pacific Coast, it is superior to any other journal for all kinds of mining and hydraulic machinery and other mechanical work, building materials, new manufactures and inventions. Our rates are very reasonable compared with those of other first-class journals.

DEWEY & CO., Publishers.

THE GRAND PACIFIC—This hotel, well known to all persons from the Pacific Coast who have visited Chicago of late, under the new management is a perfect success. It is well for travelers to remember that at this house, in order to meet the expectation of the public in these times of financial depression, a sliding scale of prices has been arranged, from \$3 to \$5 per day, with board, according to location of apartments, the service, table and all other accommodations being the same to all guests. The entire house has been re-furnished and decorated, so that it is handsome both externally and internally. All the conveniences and modern improvements for the convenience of the guests are at hand.

Dewey & Jordan have been at 433 Montgomery street, S. F., for 13 years. They are reliable—like the "New York watches" they sell.

Look out for a man calling himself J. Livingston. Last whereabouts in Yuba county.

A VALUABLE MINING BOOK.

BY J. S. PHILLIPS.

The Explorers', Miners and Metallurgists' Companion, 682 pages, 83 illustrations. Second Edition. A California publication.

OPINIONS OF THE PRESS.

The book is exactly calculated to suit the views and meet the requirements of those for whom it has been written.—*London Mining Journal.*

The most practical and comprehensive work on mining subjects extant, and valuable book of reference.—*Mining and Scientific Press, San Francisco.*

We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—*S. F. Golden Era.*

This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that they cannot afford to dispense with.—*S. F. Commercial Herald.*

This book is free from trash, and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—*S. F. Daily Alta.*

In the several sections the work is eminently practical. It is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—*S. F. Daily Examiner.*

It affords a vast quantity of information as to the appearance and value of different ores.—*S. F. News Letter.*

It is the best single English treatise we know for the use of prospectors and practical miners.—*The Engineering and Mining Journal, New York.*

Sold by Dewey & Co., at this office. Price \$10.50.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of chloride of copper and protoclauride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the Kriches, Smalting, Mexican process, Chilean process Kriches' process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel, trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners' and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome Street, San Francisco.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

"Faith and Confidence."

LIVERMORE, Oct. 1st, 1875.

Messrs. DEWEY & Co., Patent Solicitors: Gentlemen—Yours of the 29th ult., containing my patent to Elevated R. R. duly received, and I hereby return my sincere thanks to the MINING AND SCIENTIFIC PRESS Patent Agency for your promptness and honesty in regard to our business connections. I have received a flood of circulars from Eastern firms, desiring to deal with me, but I have declined any communication with them and prefer as soon as circumstances will permit, to negotiate with and patronize a home institution; one in which I have faith and confidence—DEWEY & Co.

Again thanking you for your promptness in securing my patent, I remain, obediently yours,

WM. H. HARRISON.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us against the acts and mistakes of others.

WRITE for the MINING AND SCIENTIFIC PRESS. We invite not only professional men, but practical miners and mechanics to contribute to our columns. All communications will be kindly treated. Authors, as well as readers, will be benefited by corresponding.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

California and Arizona Mining Company.

Location of principal place of business, 507 Montgomery Street, San Francisco, California. Location of works, Mariposa County, Territory of Arizona.

Notice is hereby given, that at a meeting of the Board of Directors, held on the third day of April, 1877, an assessment (No. 2) of two cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin to the Secretary, at the office of the company, 507 Montgomery Street, San Francisco, Cal.

Any stock on which this assessment shall remain unpaid, on the thirtieth day of May, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the fourth day of June, 1877, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors. T. E. JEWELL, Secretary. Office, 507 Montgomery Street, San Francisco, California.

Dolores Consolidated Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Dolores Mining District, Esmeralda County, Nevada.

There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the seventeenth day of February, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Certificate.	No. Shares.	Amount.
Blasdel, H. G., Trustee.	16	10,000	\$1,000 00
Blasdel, H. G., Trustee.	17	5,000	500 00
Blasdel, H. G., Trustee.	18	5,000	500 00
Blasdel, H. G., Trustee.	19	5,000	500 00
Drexler, L. P. & Co., Trustee.	8	25,000	2,500 00
Fry, J. D., Trustee.	7	10,000	1,000 00
Keene, J. R., Trustee.	9	10,000	1,000 00
Talbot, W. C.	3	100	10 00

And in accordance with law and an order of the Board of Directors, made on the seventh day of February, 1877, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of said company, on Monday, the sixteenth day of April, 1877, at the hour of two o'clock, p. m. of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale.

J. W. CLARK, Secretary.

lowest possible terms.

TULLOCH'S AUTOMATIC ORE FEEDER,

Awarded the Centennial Medal.

The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in
40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is
so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop
regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an
automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each back-
ward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.We append a few extracts from the many testimonials which we have received from mill men and practical
mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these
testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of
the parties certifying to those herewith given, will establish their value and genuineness:Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I con-
sider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no
man living can feed a battery as well; they save us in labor alone \$48 a day. Mr. Green, of the Phoenix mill (12),
Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use
14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We
are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar
since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Strike companies, Plumas county, writes:
From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage
them; the saving in both labor and castings is fully one-half over the old style of feeding by hand. Mr. Preston
writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have
ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet
or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

CAST STEEL SHOES AND DIES.

Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents
to 12 Cents Per Pound.

Owing to our largely increased business, the present
low price of Iron from which our Steel is manufactured,
and the improved facilities for casting and forging,
we take great pleasure in announcing that from and
after this date we will supply our IMPROVED CAST
AND FORGED STEEL SHOES AND DIES FOR
QUARTZ MILLS at twelve cents per pound, delivered
at San Francisco or Sacramento, instead of sixteen
cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore
Crushers, Steel Gut Gearing, etc., for Mills and Hoist-
ing Works, Steel Pan Shoes, Battery Cams and Tappets,
etc., etc.

Address all orders, with dimensions or drawings, to

PICKERING ENGINE GOVERNOR.

VALLEJO FOUNDRY, October 17th, 1876.

Messrs. NEYLAN & YOUNG, San Francisco,

Agents for "PICKERING GOVERNORS."

Gentle:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this
year for my patent Straw Burning Threshing Engines give splendid satisfaction. They
far surpass for regularity of speed any Governor that I have ever seen, and I have
seen all the best kinds; I have seen the main belt fly off the pulley several times this season
while threshing, and the engineer did not discover it, so perfectly was the speed main-
tained, until he was told of it; this I consider something wonderful; I consider the Gov-
ernor absolutely perfect, so far as speed is concerned. I bought and put on to one of
my engines a Shive Governor, to see which was the best, and after one season's trial I
have no hesitation in saying they are far superior to any other Governor that I have seen or
used. I wish you would send me the lowest price that you can furnish 25 Governors for
next season's engines. Yours respectfully,
J. L. HEALD.

Mining and Scientific Press Patent Agency.

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free.

Compliance with Mining Laws.

The loose and careless manner in which mining locations are made, or the yearly expenditures on such locations worked out, has caused considerable confusion in the titles of a good many mining claims in different parts of the coast. This is partly due to carelessness and partly to ignorance of the law on the part of the miners, but could be avoided by plain, explicit local laws, which do not conflict with those of the General Government, but would, at the same time, be plain enough so that any miner would understand them. It has been the custom almost everywhere, in locating a claim, to throw together a few loose rocks, and write out a notice claiming so many feet in such a direction, without attempting to give any explicit description of the boundaries of the claim or its locality. In such cases, should the claim turn out to be a rich one, and a patent be desired, there is apt to be litigation concerning it. The boundaries should be well defined, and a clear description of the location be recorded, with necessary names, dates, etc. In working out the assessments called for by law even more care should be exercised, and the work done should be made a matter of record with the proper official of the district. Some miners have kept their claims by starting work on the last day of the year and stopping on the 1st or 2d of January—after that letting the claim lie idle. This sort of thing would, of course, not stand good in any court of law, and might cause endless dispute in case of anything rich turning up. If the district laws were more imperative on these subjects than they usually are, the miners would be saved considerable trouble in the end, and the lawyers have less business to do.

We noticed, some little time since, that the mining district laws of Cerro Gordo, Inyo county, had been changed in a manner to overcome the difficulties enumerated above, and it seems they are working well there. A correspondent of the *Coso News*, writing from there, says:

"We provided for these cases in our newly-amended by-laws, thinking that a vein which is not worth the trouble, in locating, to measure out the proper boundaries, or to do a certain amount of labor upon it, showing the *bona fide* intention of the locator, is not worth having. Since the 20th of last February, then, on which these by-laws went into force, no claim shall be recorded the boundaries of which are not properly defined and marked out—a fact which may be proved by two witnesses before the Recorder. In regard to expenditures, the labor must be commenced within sixty days after the date of location in each year and performed within eleven months. A book of records of expenditures is to be kept by the Recorder, in which the yearly assessment work on each mine is to be entered, describing, at the same time, in what such labor consists. Either the Recorder or two reliable witnesses, having first inspected the work, can testify as to the amount of labor performed, when the claimholder is entitled to a certificate from the Recorder. The good effect of these provisions is already manifest, for a great deal more work has been done on locations this year than in many a year before."

"BLACK ROCK" is the name of a new district in Eureka county, Nev. The boundary lines are as follows: Commencing at the south end of Wells's hay ranch, running north ten miles, thence east ten miles, thence south ten miles, thence west ten miles to the place of beginning. H. W. Brooks is Recorder. As will be seen by our "Mining Summary," encouraging news is received from the district.

FRANK LESLIE, with his wife and several friends and a corps of artists, left New York last Tuesday for the Pacific coast.

Mining Decisions.

A recent decision by the Commissioner of the General Land Office in the case of the Woodville placer application, is as follows: Where no adverse claim was filed, and no suit begun within the period of publication, or thirty days thereafter, but a suit was afterwards instituted before a court of competent jurisdiction, wherein the plaintiff recovered judgment against the applicants for a patent for an interest in their mine, and he then filed with the Commissioner a transcript of the judgment roll as a bar to the issuance of a patent, *Held*: That the plaintiff had no standing before the Land Office, and that his remedy was in a Court of Equity, to compel the patentees to convey to him that portion of the patent for which he recovered judgment in the court of law.

The Secretary of the Interior, in the case of Poley & Thomas vs. The State of California, involving title to a school section in the Stockton land district, has decided that title to all

applicants for patent, December 1st, 1866, and that the present applicants purchased the remaining interest in said mine on the 2d day of July, 1867. The applicants allege that they and their grantors have been continuously in the possession of said mine since the original discovery thereof, and that they have in all respects complied with the requirements of the law in holding and working the same.

On the 21st of October Richard M. Keyes made final homestead entry No. 280 of said northeast quarter, section 32, and on the 20th of January, 1875, patent issued upon said entry.

No title was acquired by virtue of this patent to any known mine, for, by the positive provisions of the statute, lands are not subject to pre-emption or homestead entry "on which are situated any known mines or miners." (Sections 2258 and 2289, Revised Statutes.) Title to mineral land can only be acquired by parties who show compliance with the terms of the Act regulating the disposal of mineral lands.

A "known mine" did exist upon the land in

Commissioner Williamson, of the General Land Office, rendered an interesting decision in the case of Buel & Bateman, applicants for patents for certain coal lands, in conflict with the application of the town of Coalville, Utah, for a patent for its town site. The Commissioner directs that a patent shall issue to the town for its site, reserving the coal rights to the coal land claimants, and reserving the rights of the town site to the town site claimants. In effect, the surface will be patented as a town site, and the underlying coal deposits will be patented to other parties.

New Hoisting Engine.

The accompanying cut represents a new mining hoisting engine, lately introduced on the Comstock and other mines by Berry & Place, of this city. The engraving shows a temporary frame for the reels. The framework used is much more substantial, and is usually built by the parties purchasing.

These engines are built from plans and specifications suggested by several of the leading engineers of the Comstock lode. They are built by Messrs. Cook, Rymes & Co., of Massachusetts, whose hoisting engines have long been known on this coast. They have locomotive boilers, fixed to a heavy iron bed, with two cylinders, one on each side, reverse or link motions, and two heavy iron drums. Three sizes of drums are built—two and a half feet, four feet, and five feet—suited for either hemp or wire rope. Each drum is provided with a brake or clutch, so that one or both drums may be used. The brake levers, reverse lever, and clutch and throttle levers are all so arranged as to be right at hand and under perfect control of the engineer without his moving from his position.

The engines are built either twenty-five, thirty, forty or fifty horse power, and are calculated for sinking shafts from 500 to 1,600 feet. Parties interested can see them by calling on the builders' agents, Berry & Place, corner of Market and Front streets, S. F.

BERRY & PLACE'S MINING HOISTING ENGINE.

of the 16th and 36th sections of unoccupied public lands in California vests in the State at the date of the survey, if at that time they are not known to be mineral, or are not treated as such by the State. The important general principle announced has never before been authoritatively established. The section in controversy was not discovered to be mineral until four years after the date of survey; but, according to this decision, the State title would have been firmly attached to the section, if minerals had been discovered upon it the next day.

The following is the full text of an important ruling by the Commissioner of the General Land Office, which decides a question of great interest to miners:

DEPARTMENT OF THE INTERIOR,
GENERAL LAND OFFICE, WASHINGTON, D. C.
March 26th, 1877.

Register and Receiver, Stockton, California—Gentlemen: On the 17th of October, 1876, Horace Bellows, H. C. Badger and Augustus Walker presented their application for patent for one thousand linear feet of the Champion mine, with surface ground six hundred feet in width, said premises being designated by the Surveyor-General as lot 37, township 11 south, range 23 east, Mount Diablo meridian.

You refused to receive and file said application, as it includes and embraces a portion of the northeast quarter section 23 in said township, which was entered by Richard M. Keyes, October 21st, 1874.

The papers submitted in the case and the records of this office show that R. M. Keyes and two others located one thousand feet of the Champion mine on the 21st day of May, 1866, and that such location was recorded in the Recorder's office of Fresno County, California, on the same day at the request of R. M. Keyes; that Keyes on the 21st of June, 1866, purchased the interest of one of his co-locators and conveyed his entire interest to the present

question at the date Keyes made his entry, a mine located by himself and others, and sold by them to the present applicants.

It appears by a copy of the decree of the court of the Thirteenth Judicial District of California, rendered on the 18th of November, 1876, in the case H. Bellows et al. vs. R. M. Keyes et al., that it was decreed by said court that "the plaintiffs have had ever since the 27th day of May, 1867, and still have the possession and exclusive right to the possession of their said mining claim and premises, and are and have been for years past entitled to apply for and receive a patent from the government of the United States, under the laws of Congress, and in conformity thereto, of and to and for said mining claim and premises. That the said patent to said R. M. Keyes conveys and grants to him or to his assigns no right or title or interest in or to the land embraced within the said northeast quarter of said section 32, covered by this mining claim and premises of the plaintiff."

That the said patent and the said conveyance thereunder made, be, and the same are hereby set aside and declared null and void, and the defendant and each and every one of them are forever estopped, and hereby precluded from claiming any right or interest in title to or ownership of said mining claim and premises or any part thereof.

And the right of possession of plaintiffs of and to their said mining claim and premises is hereby affirmed and declared valid, legal and just."

As the Government has not yet divested itself of the title to said mine, you will receive the applications of said H. Bellows, et al., for patent therefor, upon compliance with the law and instructions.

Be pleased to inform all parties in interest and acknowledge the receipt hereof. Very respectfully, your obedient servant,

J. A. WILLIAMSON, Commissioner.

PROFESSOR THUREAU, of Victoria, Australia, is at present visiting the mines near Grass Valley. The *Union* says he comes commissioned by the government at Victoria to examine all the machinery used in any kind of mining in this country, and to purchase such as he may think will suit in the mines of Australia. He will thoroughly inspect the modes and methods of the miners here, and even the way in which they live. After looking at the principal mines of California, Nevada and other places on the coast, Prof. Thureau will return to his country and make a report. He has been given every facility in Grass Valley for making his observations. In a few days he will go up to the northern part of the county, where the big gravel mines are at work.

SCIENTIFIC EXPEDITION.—Professor Taylor, of Chicago, has left Victoria, B. C., for Sitka, to make a survey of the famous snow peak, Mt. St. Elias, and ascertain the altitude of the mountain. The peak is situated 350 miles north of Sitka, and has never been ascended yet, and its height has not been determined. Professor Taylor is accompanied by Lieutenant Wood, U. S. A., and all the instruments, apparatus, etc., for scientific experiments. The result of the exploration will be reported by the Departments at Washington.

THE *Elko Independent* is informed by Sam Linkton, Superintendent of the Grand Prize mine, that the company has closed a contract with Messrs. White & Allen for the construction of a twenty-stamp mill, as soon as practicable, near the mine.

A LARGE number of factory operatives in New Jersey are on a strike against a reduction of wages.

CORRESPONDENCE.

Mines and Machinery of Ward, Nevada.

[From our Traveling Correspondent.]

EDITORS PRESS:—The district is comparatively new, lying 100 miles south-east of Eureka and by far the liveliest of any in White Pine county. The principal facts in regard to the mines were written up by Mr. Robt. Briggs, who has charge of the Paymaster, Defiance and other mines of the district, and as they were fully confirmed by personal observation as to the most important, they are submitted almost verbatim as furnished. An explanation may be necessary in reference to one kind of country rock found here, usually styled a granite. As it is probably as much of a porphyry as a granite, the phrase granitic porphyry has been substituted; in some cases, for the sake of brevity, the term in ordinary use being retained without qualification.

The Geological Formation

Is of a peculiar character and such as nowhere else, to my knowledge, exists in eastern Nevada. For nearly a mile in width, and running diagonally along the side of the main mountain range, is a scope of country alternating with belts of granitic porphyry and limestone. These belts of separate formation vary but very little in width, being generally from 75 to 100 feet wide, and bearing almost invariably, with one or two notable exceptions, a uniform course, that is north 58° west. Along the contact of these formations is located the principal mines of the district. The main company operating here at present is the

Martin White Mining Company,

Of San Francisco, L. G. Clement, General Superintendent of mines, mill and furnace. This company own some 20 different and distinct mines, to six of which United States patents have been obtained, and all are more or less developed and present as good a showing for permanency and constant yield of high grade ores as any series of mines in the State.

The first in importance of this company's mines, because it is the most developed, is

The Paymaster.

This mine is located on the mountain side, about one mile above the company's reduction works and at an altitude of 1,500 feet above the general level of the valley. The mine is opened by a series of tunnels, Nos. 1, 2 and 3, and by a main working shaft. Tunnel No. 1 enters cover a few hundred feet below the discovery shaft and follows the vein for about 800 feet, and at its present face is about 180 feet below the surface. Along this tunnel is found some immense chambers of high grade ore. At one point the vein is fully 24 feet in width and has yielded an immense amount of rich ore. One car-load of 10 tons, shipped to San Francisco in April last, yielded a net profit of over \$8,000. The course of the vein is the same as the separate belts of formation above referred to and its incline is about 45° to the south. The limestone forms the foot-wall and the granitic porphyry forms the hanging-wall. Tunnel No. 2 is 100 feet below No. 1 and as was commenced further down the hill is now 1,200 feet in length. Along this tunnel, until we reach a point within 100 feet of its present face, is encountered the same geological features and characteristics as are found in No. 1. At the point above referred to, and which is 1,100 feet from the mouth of the tunnel and 280 feet below the surface, the vein widens out into an immense chamber of fine ore, fully 30 feet. Here a peculiar feature occurs. The contact changes its incline, dipping to the north, as is demonstrated by a winze which is sunk 100 feet, and thus reversing walls, the so called granite being the foot-wall and lime overhanging. A portion of this large ore body follows down this contact but is not of so high grade as the ore above, while a much larger portion of the body of ore leaves the contact and lime entirely and strikes out and down through the other formation. The extent of this portion of the vein is not yet known, as it has in no place been cross-cut. A drift has been run on it for a distance of 80 feet, which demonstrates that its course (horizontal) varies 54° from the direction of the main contact. The average assay value of this body of ore is \$300 per ton and it is very easily mined, requiring little or no blasting.

The Defiance

Is the next mine of importance belonging to this company, and is located one-half mile from the Paymaster, and at an altitude of about 1,200 feet above it. This mine produces exclusively lead ores, (carbonates and sulphates of lead,) which is used as a flux for smelting ore from the Paymaster, but is of a much lower grade in silver. The course of this varies from that of the Paymaster and other mines of the district, and is almost due north and south, having its dip or incline to the east. This is also a contact vein, having the granite for its hanging-wall and limestone for the foot-wall. Here we have between these walls a vein of decomposed quartz, hematite and manganese full 60 feet wide. Throughout this vein matter occurs irregular chambers of fine carbonate

of lead ore; these chambers of ore are generally stronger nearer the lime-stone than they are toward the granitic porphyry. During the past eight months this mine has produced over 5,000 tons of ore, all of which has been consumed at the company's furnaces. The mine is now worked through a tunnel, which taps the vein 140 feet below the surface; from this tunnel two winzes have been sunk 60 feet deep. A main working shaft with two compartments securely cribbed with three-inch plank is now being sunk on the mine and is down 140 feet.

The Mountain Pride

Mine, belonging to the same company, lies east of and adjoins the Paymaster, and is opened by means of a tunnel. This mine produces ore similar in character to that of the Paymaster, but it does not occur in such large bodies as in the latter. The Mammoth and Ben Lomond lie immediately south of the Defiance, and are an extension of the same, as the croppings are identical and ore readily traced the whole distance of the three locations. The Mammoth is being opened by means of a tunnel which will tap the vein 140 feet below the surface. A few feet more will bring the tunnel into the vein, when it is expected a large body of ore will be developed.

The Carolina

Is located east of the Mammoth, and shows an immense outcrop some 60 or 70 feet wide. A shaft has been sunk on this vein to a depth of 60 feet, which has yielded some very high grade ore. The Young America adjoins the Paymaster on the south and west, and has been opened with a shaft 100 feet deep, which shows a continuous body of ore all the way from the surface down.

The limits of this article will not allow, at this time, a description of the remaining mines of this company.

The Steptoe Consolidated

Mining company is the next of importance in the district, and is superintended by Mr. Robert Briggs. This corporation owns a series of mines consisting of the Ready Cash, Emily, Light, Cow, Old Ned, Profit and Fourth of July. The Ready Cash, like the Defiance, is a contact vein, lying between granitic porphyry and lime, and produces the same character of ore—carbonate of lead, and assaying high in silver. This mine is opened by a shaft 100 feet deep, from which levels have been run each way along the course of the vein for a considerable distance. The granite here presents an even and uniform wall, while the limestone apparently gives way at places, forming large chambers of ore. The location is most favorable, being on the south side of the mountain and is surrounded on all sides by the most important mines of the district.

The Emily

Is also a contact vein, yielding a chloride ore. The contact here does not seem to be so regular as in some of the other mines, but, as it is located lower down on the mountain, the irregularity is produced probably by some disturbance of the earth's surface, and when a sufficient depth is attained there is no doubt but that it will assume the same regularity as that which characterizes many other mines in the same locality. The ore obtained from this mine is such as to give great hopes for its future. The Cow presents about the same characteristics as the Emily, and is located but a short distance from it.

The Light

Adjoins the Paymaster ground, and though but little work has been done, the developments are of a most favorable character. We find here the same character of vein matter lying along the contact (manganese and decomposed lime) as that which led to the rich bodies of ore in the Paymaster. Interspersed through this vein matter is found occasional bunches of high grade ore, thus indicating that a strong body of rich ore exists at no very great distance below. The Profit, Old Ned and Fourth of July are located low down on the mountain, and are exclusively in limestone formation. The ore produced from each of these mines is of the same character (a chloride) and assays very high in silver, but as the formation is hard, they are somewhat expensive to work.

The Pleiades Mine,

Owned by Weaver, McKinzie & Co., is located a few hundred feet north of the Paymaster and yields a similar character of ore. A shaft is down on this mine 140 feet, and shows a continuous body of ore all the way down from the surface. Several hundred tons of good ore is now piled on the dumps. This company also owns the Atlantic Cable and several other mines in the district.

The Governor Con. M. Co.

Is a recent corporation formed in San Francisco for the purpose of working the Governor, the Grampus and other mines in the district. The Governor is yielding some very high grade ore, some of which assays as high as \$6,000 per ton.

The Latima, owned and worked by Mitten & O'Brien, is a contact vein, and is producing some good ore. These gentlemen evidently have a good thing and are buoyant with hope.

The Ward Con. M. Co.

Own two lodes, the Shark, a contact vein between the granitic porphyry and the limestone; shaft 150 feet and drift 90 feet from the 100-foot level. The fissure is very large, with from two and a half to four feet of excellent free-milling ore, giving assays from \$100 to \$1,000,

choice samples going as high as \$10,000 per ton; no working test as yet made.

The San Mateo, 200 feet from the Shark, and a parallel vein, has been cut by the tunnel, running for their other lodes. It lies in limestone, but near the granite (so-called) and is fully 15 feet in width, containing a carbonate and smelting ore. The same company are also running a tunnel to tap the I X L at the depth of 200 feet from the surface. In the absence of Mr. Gleason, the Superintendent, the desired information was promptly furnished by Mr. J. McCarty, foreman in charge.

The Martin White M. Co. Smelting Works.

So much space has already been taken up with the mines, that many interesting details are necessarily omitted, in regard both to mill and furnace, room being left for only a few of the most striking points. Suffice it to say, that both are fully equipped with all the usual appurtenances of the best appointed establishments of the kind. The furnace consists of two stacks, each with a water jacket and a quick-silver gauge to indicate the pressure of the blast per square inch.

Perhaps the most novel and interesting feature about the works is

The Condensing Chamber,

Which is apparently of too much consequence to be dispatched with a line. It surrounds the stack something like the drum of a stove-pipe, midway from top to bottom. It is provided in the interior with an umbrella-shaped dome with an apron below it, 14 inches in width and of a diameter 28 inches greater than that of the stack, by which all the heavier particles are thrown back into the outside apartment of the chamber, which last has a diameter proportionately larger than that of the apron. The exhaust steam from the engine is conducted to a point a little above the dome, condensing the remaining finer dust that passes upwards, which in turn falls back upon the sides of the dome, whence it slides into an incline and discharges itself on the feed floor between the doors of the furnaces. So effective is the arrangement that not a single case of lead poisoning is known to have originated either in the village or at the works from the commencement of operations.

Mr. F. F. Thomas, the Superintendent, puts the average of the ore from the Paymaster mine at present smelted, at \$350 per ton, from six to seven per cent. of this gold. Of the lower grades at furnace there are 1,000 tons that will run from \$80 to \$90, 150 worth \$130 and 50 tons of \$200 ore, besides 25 tons that will work as high as \$400 per ton. The ore just now worked at the mill is fourth class or the lowest grade, averaging about \$35 per ton, and some 700 tons still on hand.

As it is now pretty generally known that

The Lixiviation Process,

Introduced here at the mill of the Martin White company, did not at first and perhaps has not yet come fully up to what was expected from it, particular inquiries were made of Mr. E. W. Wagner, the present Superintendent, as to the difficulties encountered, the proposed modes of remedy, together with those already tried and found effectual, which will now be presented as concisely as possible.

For its successful working, three conditions are considered absolutely necessary:

1st. A suitable ore, or one capable of being chloridized to a high percentage.

2d. A sufficiency of water.

3d. A well appointed mill, where the ore can be handled with dispatch.

The greatest difficulty from the outset, now being gradually overcome, arose from the character of the ore not containing a sufficient quantity of sulphur to chloridize well. The Paymaster mine is now supplying a class of ore with more of the requisite ingredient and much better suited for the process. The second great drawback was the lack of water, now being supplied in larger quantity, and, in the last place, owing to the newness of the process on the coast, many changes had necessarily to be made in the arrangements around the mill, with the view of reaching the required dispatch in handling the ore to produce the desired results.

It is thought the ore can be leached up to 95% of the chlorination. The gold is here alloyed with silver and is saved in part also by the process, probably in like ratio with that of the silver. The mill is of 20 stamps, dry crushing, provided with crusher, drier and a White rotary furnace, and as it is the first to try it in the State or to any extent perhaps on the coast,

Their Leaching Process, in its Details,

Will be read by some with pleasure, if not with profit. After the pulp has been roasted and thoroughly cooled, it is dumped into 15 leaching tanks, of one and a half tons capacity each, to be subjected to a washing with warm water—the hotter the better—from two and a half to four hours, owing entirely to time required for leaching off the salt and base chlorides. It is next leached by a solution of hyposulphite of lime from 14 to 16 hours, which dissolves the chloride of silver, the only chemical combination of the metal at all affected by the preparation. The leached solution is now turned into five receiving tanks, capable of holding 500 gallons each, connected by three-inch gas-pipes, and thence drawn from the center tank to the precipitating tank on the floor below. Sulphide of calcium is added in sufficient quantity to precipitate the silver as a sulphide. This, in turn, having been dried in the reverberatory oven and subjected to a roasting for dispelling the

sulphur, finally results in an oxide of silver, to be melted down and molded into bars.

A Dollar Saved.

The sulphide of calcium and the hyposulphite of lime are both manufactured in the mill at a mere nominal expense, crude sulphur and burnt lime found near at hand being the only chemicals required—the former by boiling sulphur and lime together with water long enough to cause them to unite, forming a strong, yellowish-hued liquor. From this the hyposulphite of lime is now made by injecting through it a stream of cold sulphurous acid, thereby precipitating the sulphate of lime and leaving the liquor clear as water. It is scarcely necessary to state that the solution gains strength by use, and can be employed over and over again.

The report of mines at Pioche, intended to form a part of present letter, must be deferred to another issue.

A. C. K.

Persevering Work.

If there is any class of men, says the Salt Lake Tribune, whose toil deserves to be rewarded by all that the toiler hopes for, it is the hard-handed, large-hearted and free-minded miners who make up the camps of this Territory. As an example of these men—and they are every inch men—it is gratifying to point to Maurice McGrath (Winnamuck) and his five partners, who have undertaken one of the most difficult mining operations in Bingham.

It is estimated that the sum of \$2,000,000 in gold dust has been taken out of this canyon, which amount has been obtained in gophering around in the side hills above the bed of the creek and in bars. It has been found impossible to go down to bedrock in the bottom of the gulch by means of shafts, on account of the water which rushes into the works in quantities that would require the heaviest pumping machinery to lift out. Hence the bedrock in Bingham has never yet been reached, below the bed of the creek, although several companies representing considerable money have been organized for the purpose, but had all abandoned the enterprise, when Winnamuck and his partners, on the 20th of September, 1875, took hold of it in earnest.

Near the old Winnamuck smelter they started in a tunnel, running up the canyon under the present bed of the creek. They have labored constantly, some of the six laying off occasionally to work in the mines for the money to keep up the living expenses of the other members of the company. In this way they pushed the tunnel in over 1,400 feet, and have attained a depth of only about 50 feet below the surface. This tunnel has been worked through shafts about 150 feet apart, the waste being hauled up to the surface in a bucket by means of a rope and windlass. The material through which the tunnel has been driven is chiefly loose rock, so loose that it has been found necessary to timber as closely as possible every foot of the way, as the water rushes down from both sides and the roof in torrents. In some of the shafts which have been sunk near the creek it was necessary to timber in the same manner. Indeed, their last shaft they were compelled to dig from the tunnel out to the surface like gophers.

The boys think they are near the bedrock, where, of course, they expect to strike it rich, which expectation we would like to see completely realized, for such energy, industry and patience are virtues that ought to be rewarded to the tune of a million dollars.

Mining Prospects of Eastern Oregon.

The doubts that have so long hung dark and gloomy over the prospects of eastern Oregon are rapidly disappearing, and the sky of prosperity is gradually becoming bright and clear. Our farmers are beginning to realize that they are becoming comfortable and wealthy, and that they have the means within their reach to still further improve their condition morally and socially, as well as in a worldly point. There is now a strong probability that they will find a good and profitable market for their surplus stock, as they have heretofore found for their farm products. This gives them encouragement and the lining of the skies for the future looks bright for them. Stock of all kind is on the upward tendency.

The prospects for our rich and extensive quartz mines are brightening and capitalists are now seeking investment with us. They have had, and now have, experts examining our mines, and from the reports made they have already invested, and we have no doubt but that the reports to be made by the experts, now testing other mines, will be the means of bringing other capitalists among us, who, with those who have already invested, will immediately go to work systematically to working the rich and valuable mines of eastern Oregon, which, in a great measure, have heretofore lain idle for the want of capital to work them. That they will pay a large dividend to those who will properly work them, no one who has a correct knowledge has any doubt. In a great measure we are indebted to the capitalists of Portland, represented by Mr. S. G. Reed, for the bright prospects for the mines of Baker and Grant counties. The working of our mines will make a good home market for our farmers, and this again overspreads their faces with gladsome smiles, in anticipation of their own as well as our whole people's future prosperity. The one great consideration now necessary to make us all happy, is the building of a railroad to connect us with the outside world. Necessity will soon force its construction.—Bedrock Democrat.

MECHANICAL PROGRESS.

The Strength of Riveted Joints.

It has been suspected for a long time by persons who have investigated the strength of riveted joints that the ordinarily received data relating thereto cannot be relied upon implicitly, and that for some reason, not clearly explained or understood, such joints would often break at much less strains than calculation would indicate to be their ultimate strength. The basis, says the *Railroad Gazette*, on which the data employed in such calculations rested was the experiments of Fairbairn, which were in some respects very unsatisfactory. These showed that the strength of a single riveted joint was equal to about 56 of the solid plate, and a double-riveted joint from 70 to 72. Nevertheless joints failed at times when Fairbairn's deductions showed they ought not to fail, and boilers from time immemorial have blown up which apparently had no sufficient logical or mathematical reason to justify their conduct. Such an explosion took place in Blackburn in England in 1874, and excited a keen interest and led to hot disputes among engineers afterwards. In order to set some of these disputed points at rest, Mr. R. B. Longridge, engineer to the Steam Boiler Insurance Company, instituted a series of experiments on the strength of riveted joints, which have been carried out by the celebrated Mr. D. Kirkaldy, whose investigations of the strength of materials have now become so noted, and the results and accuracy of whose investigations will not be questioned.

The details of these experiments have not yet been fully made public, but in his last report to the Steam Boiler Insurance Company, Mr. Longridge gives some of the results of these experiments. These, in a condensed form, apparently, are published in a recent number of the *Engineer* (Feb. 23d, 1877). The conclusions deduced therefrom may be briefly stated to be, that boiler seams are not nearly as strong as Mr. Fairbairn thought and many of us believed they were. In 28 experiments with single-riveted lap joints, the average of the strength of the riveted seams, compared with that of the plate, was only 42.2, the lowest being 38.9, and the highest 50.6. The average of 20 experiments with double-riveted lap joints was 60.2 of the solid plate, the highest being 66.1, and the lowest 53.2. The average of 16 experiments with single-riveted butt joints was 57.5, the highest 66.1, and the lowest 51.5. With double-riveted butt joints the average of 20 experiments was 66, the highest 67.2, and the lowest 61.6.

Experiments were also made with "diagonal joints," that is, joints which instead of being at right angles with the sides of the test piece were placed inclined at an angle of 45°. A single-riveted lap joint of this kind gave a strength of 60.1 of the solid plate, and a double-riveted lap joint of this kind a strength of 69.2. The strongest of all the rivets was one which is described as a "double-riveted butt joint, breaking joint 7 holes or 14 in." What is meant thereby is not apparent, but this joint gave a strength of 74.7 of the solid plate.

The plates varied in thickness from one-fourth to one-half inches, and the rivets from one-half inch to 15-16 inches in diameter.

One noteworthy fact was developed by the experiments. Some of the plates in which the rivet holes were punched were annealed and others unannealed when tested. Whether the annealing was done after or before the rivet holes were punched is not stated, but the great increase in strength is very apparent all through. Thus in the first experiment given the strength of the seam of the plates which were not annealed was 38.9 of the solid plate, whereas those which were annealed gave a percentage of 45.7 of the solid plate. In these two cases the plates were broken, but, what is very singular, in those experiments in which the rivets were sheared, the resistance of the latter seemed to be increased by annealing the plates, which is owing, probably, to the fact that the increased ductility due to the process of annealing permitted the rivets to "come to a bearing" more perfectly than was possible when the plates were less ductile.

None of the plates in which the holes were drilled were annealed, so that it is impossible to say whether their strength would have been increased by the same process. But whether the plates were annealed or not, in no case was the strength of a single-riveted joint as high as that given by Fairbairn, that is, 56% of the solid plate.

LOSS IN METAL WORKING.—Last summer we had some articles on the loss of precious metals by vaporization. The same loss is guarded against by Eastern manufacturing establishments. We read in the *Hartford Times* that on the recent closing up of the Smith & Rogers silver plating concern in New Haven, on its removal to Meriden, the floor of the plating-room was taken up, burned, and the ashes analyzed, with the result of procuring pure silver to the amount of \$981. This result is not so strange as appears at first sight. The precious metals are capable of extreme volatilization under heat, becoming mere vapors, which may be condensed, resulting in the production of the metal in a pure form. But even without heat the particles of gold and silver are made so exceedingly fine in the processes of the manufacture of

gold and silver goods, whether solid or plated, that no devices for saving the material abraded or thrown off in the various manipulations are entirely effectual. Even in the Government assay offices the soot deposited in the chimneys from the melting of the crude metal is valuable; and in most manufactories of articles of gold and silver the proprietors do not allow the workmen to retain their work clothes when worn out but pay for them a price generally sufficient to procure new garments—an old tattered vest belonging to a bench workman sometimes being valued by his employers, even when worn to rags, at \$20.

MORE ABOUT THE KEELEY.—The *Western Manufacturer* says: An exchange informs us that the Keeley motor still lives. The old difficulty of finding something strong enough to hold the wonderful power developed from a few drops of cold water, seems still to be the most serious thing in the way of Mr. Keeley's success. He is now having made, at Chester, Pa., two immense hollow globes of steel, the larger of which weighs 58,000 pounds, is 36 inches in diameter on the outside, and 18 inches on the inside, making the metal inside of the globe nine inches thick, solid steel. This is intended to withstand a pressure of 25,000 pounds to the square inch. The other ball or globe is about half the size of the larger one and will withstand a pressure of half as much. A sphere of this description, manufactured at the same place a few months since, and which was warranted to stand a pressure of 60,000 pounds, burst when 50,000 pounds pressure was put upon it. We shall look with no small degree of interest for the account of the bursting of this immense sphere, for we have no idea that it will stand the test of the wonderful strain to which it is to be subjected. What this sanguine gentleman is going to do with his invention when it is perfected remains to be seen; but it is to be hoped that he will blow nobody up fatally.

ANTIQUITY OF IRON.—The oldest pieces of iron (wrought iron) now known are probably the sickle-blade found by Belzoni under the base of a sphinx in Karnak, near Thebes; the blade found by Colonel Vyse, imbedded in the masonry of the Great Pyramid; the portion of a cross-cut saw exhumed at Nimrod by Mr. Layard—all of which are now in the British museum. A wrought bar of Damascus steel was presented by King Porus to Alexander the Great; and the razor-steel of China for many centuries has surpassed all European steel in temper and durability of edge. The Hindoos appear to have made wrought iron directly from the ore, without passing it through the furnace, from time immemorial, and elaborately wrought masses of iron are still found in India which date from the early centuries of the Christian era.

PRESERVATION OF BELTING.—In order that belting of cotton or linen should have both strength and flexibility, together with adhesive power, they should be thoroughly soaked in linseed oil varnish. If the belting be new, the varnish may be supplied with a brush, until no more will be taken up, whereupon it may immediately be used without any preparatory drying. After having been in use for some weeks, a second application of the varnish should be put on. Cotton or linen belting thus prepared will neither contract nor stretch, and will always be pliable and unaffected by change of temperature. The adhesion of the belt to the pulley is likewise increased by the varnish, while steam and acid fumes have no effect upon the belting at all.—*Maschinen-Constructeur*.

STEAM FOR LUMBERING.—The superiority of steam for general transportation purposes is continually asserting itself. An extensive lumbering firm, owning a tract of land in Michigan some seven miles from their mill, on the Muskegon river, have recently built a railway for the purpose of hauling logs, and find great economy over the use of teams. The iron used is a T rail 25 pounds to the yard, and the engine and cars are light, the latter weighing 1,700 pounds. About 215,000 feet of logs can be hauled in 12 hours, with four train men—about ten times as much as the same number of men and teams could carry.

A NEW APPLICATION OF PHOTOGRAPHY.—An English exchange states that the Landore Steel Company use photography to illustrate the character of the metal manufactured by them. A plate of wrought iron is placed on a hollow anvil and a small gun-cotton cartridge is exploded on its upper surface, the result being an indentation and fissures all over the surface. A plate of steel is treated in a similar manner, and when photographs are taken of the two plates the quality of the two metals can be estimated by purchasers in all parts of the world as easily as if they had witnessed the experiments.

WARMING RAILWAY CARRIAGES FROM THE LOCOMOTIVE.—We read that all classes of carriages on the Alsace-Lorraine lines are now warmed, the supply of heat being from the boiler of the locomotive. Metallic standpipes are placed in each carriage beneath the seats, connecting with a main running the length of the carriage. Each of these is connected with the next by india-rubber tubing, the whole forming a continuous supply, which the passenger can regulate for themselves, by moving a lever placed on a sector bearing the words *cold, warm, hot*.

SCIENTIFIC PROGRESS.

The Popular Estimate of Chemical Science.

If we turn to chemistry, we shall see that while its importance is almost universally recognized, while the number of those who devote themselves to its study is increasing every year, while immense sums of money are yearly spent for the building and support of palatial laboratories, while the press, recognizing the popular appreciation of the science, furnishes, in its own peculiar way, brief records of its advance—still we can point to very little connected with chemistry which, for its elevating influence upon mankind, can be compared with the great physical truths above referred to. That which is caught at and served up for the public is taken from the lower portions of the science, while the higher portions pass on, scarcely if ever coming in contact with the populace. The public knows when a new dye is discovered, it knows when the poison has been found in some strange stomach, it knows when a new milk for babes has been concocted, it knows when precious metals have been detected in the depths of the earth, it knows all these things because it is promptly informed in regard to them, and it is right and good that the information should be given and that these things should be known. It is plain, however, that a thousand dyes might be discovered, that a thousand murderers might be brought to justice through the aid of the chemist, that varieties innumerable of milk for babes might be concocted, or that mines upon mines of gold might be unearthed without the slightest ennobling or elevating influence being exerted upon the mass of mankind. All these things would be valuable, undoubtedly, but their value would be of a very material kind. It is certain that this material value is that which is most easily recognized, which appeals most directly to the public, and hence plainly, in the public mind, the importance of chemistry is measured by the standards of this value. The reputations of chemists, too, depend upon the greater or less extent to which they devote themselves to practical questions. He who is frequently on the stand to testify in regard to cases of poisoning, he who succeeds in presenting to the world some new compound which can be used practically, he who detects impurities in our food or tells us of poisons where their presence must be of importance to us—this man is, to the public, the chemist. Ask 99 men out of 100 what a chemist is, and they will give a definition of one who practices the art of chemistry, rather than one who is devoted to the science of chemistry.—*Prof. Remsen, in Popular Science Monthly*.

Country Laboratory Apparatus.

Some of the grandest discoveries in chemistry and other sciences were made with the rudest home-made apparatus. Although the sciences have now reached such a state of elaboration that few facts perhaps lie near the surface, still there may be much advantage in setting at work a large class of earnest students who are unable to possess themselves of all the contrivances of a well-appointed laboratory. As a hint in this direction we take the following from the *Chemical News*, written by E. T. Hardman, a practical chemist:

The following short description of an extremely effective, cheap and cleanly substitute for crucible jackets, etc., may be useful, especially to those who, like myself, have occasion to shift their quarters often, and are obliged to work with a necessarily limited laboratory accommodation.

The ordinary crucible jacket being made of sheet iron has in reality but one use—to protect the flame from currents of air. The small concentration of heat which it affords may be regarded as nearly nil, since from the nature of the material and its thinness, radiation takes place very freely.

Another drawback it has is that it soon becomes rusty or coated with scale. It is not only dirty to handle, therefore, but also presents the inconvenience of dropping some of its scale into the crucible if not carefully manipulated. Then it is an awkward thing to pack, taking up a good deal of space, rusting everything it comes in contact with, and behaving generally in a disagreeable manner; while, as it is not to be obtained in country towns, it may not be left behind.

Now an ordinary earthenware flower-pot answers the purpose in every respect. It is the proper shape, and being of a non-conducting material, it in a great measure prevents loss of heat from the burner. It is extremely cleanly to use, and last, but not least, it can be procured in every town or village at the small cost of one halfpenny or so; and there is no necessity to cumber oneself with it when moving.

The bottom of the flower-pot has a circular hole. This serves for the introduction of the Bunsen burner. As the supply of air would be insufficient otherwise it will be necessary to enlarge the opening. This can be easily done with a knife and I find it best to cut the aperture nearly in the form of a cross, and not too large. One or two trials will give the happy medium. A current of air is then obtained which not only steadies the flame, but acts in some degree as a blast. The flower-pot may be

supported in the ring of a retort stand in the usual way. The chimney is a second flower-pot inverted. To support it the handiest way will be to make three S hooks of stout wire, and having passed the narrow end of the pot upward through the ring, fix the rim within the hooks caught on the ring. It will be found convenient to devote a small retort stand permanently to the purpose.

This will be very handy, as the upper part can be raised to any desired height, regulating the heat and draft; or can be shifted from side to side, whenever it is desirable to inspect the progress of the operation going on.

The apparatus acts admirably as a small gas furnace for crucible operations, such as the fusion of silicates with carbonate of soda—as in the analysis of rocks; while for simple ignition of precipitates it renders the flame of a common glass spirit lamp most effective. The size of the flower-pot required will, of course, depend on that of the crucible and of the burner used. I find the smallest size, three and one-half inches high and about eight inches in diameter at top (internal) most generally useful.

The support for the crucible may be either a triangle of wire covered with pipe shank, the end of the wire being bent upwards and formed into hooks so as to hang on the edge of the flower-pot, or three pipe-covered wires suspended in the position of the ribs of a crucible jacket. The former is necessary for small crucibles.

The flower-pot also makes an excellent lamp-screen, for steadying and concentrating the flame under evaporating basins, etc.; of course a sufficient interval must be kept between the pot and the basin else the light will be extinguished.

A small flower-pot with wire gauze tied over the top is a very effective low temperature lamp when the gas is lighted below the gauze. If the gas is lighted above the gauze we have a capital argand lamp, giving a large, clear blue flame. In the latter case a common burner can be used, a consideration when Bunsen's are all temporarily occupied or not available. After a time the pots become cracked from the heat, but as they are easily replaced this does not matter, and even when cracked they will often hold out for a considerable time. Fireclay flower-pots made rather thick would, however, afford a really good and cheap portable furnace.

It has just occurred to me that by placing the flower-pot inside another just large enough to encase it, loss of heat by radiation would be effectually checked.

Solid Water.

Prof. Guthrie, F.R.S., gave a lecture recently at the Royal Institution on "Solid Water." Iron says: He began with the remark that those things which are in their nature most abundant, are, in fact, the most exceptional. After a few other illustrations, he pointed out that water, which is so very common, is unusual, and shows egregiously in its properties. Cast radiant heat on it, it arrests that heat; apply heat and it not only conducts it, but is pre-eminent among compound elements as a conductor. Drops of water are the largest of drops of any fluids, and hold together longest. It reflects light least. Water may be solid from the abstraction of heat, and in association with other bodies it may become solid. In the latter case it is only conventionally called solid, and it might be better to call it fixed. It was especially the "fixing" of water in compounds of water and salts that formed the subject of the lecture. About two years ago Prof. Guthrie proposed the term cryohydrates for the hydrates of those crystalline bodies which can exist solid only at a temperature below the freezing point of water. The study of the cryohydrates opens up a wide field of research of which we are but yet on the threshold. A number of experiments were shown and tables of results so far obtained in working with different compounds were exhibited. The actual production of the cryohydrates of bichromate of potash and sulphate of copper was shown on a small scale between sheets of glass in front of a lantern, the gradual growth being watched on the screen on which the images were projected. We can hardly yet tell to what practical uses these studies may lead, but this is already seen, that while the cryohydrate of common salts used as a freezing mixture maintains a temperature of 22° C., there are other cryohydrates that maintain a lower temperature. Speaking of the palaeocrystic sea, Prof. Guthrie said he ventured to predict the proportions of the salts there will be found different from what they are in other oceans. One fact not accounted for before that these studies have explained is that at 37° C. a mixture of four molecules of water and one of alcohol become solid, but that a mixture either stronger or weaker will not solidify. This explains why the rum of some whaling ships will freeze, and of others it will not. It depends on its strength. In conclusion, Prof. Guthrie spoke of the importance of a careful study of the effects caused by slight differences even in common objects.

A SINKING ISLAND.—The island of Heligoland, situated in the German ocean, and belonging to Great Britain, is reported to be gradually disappearing. It is now less than a mile in superficial extent; but in 1649 it was four miles in circumference; in 1300 it measured 45 miles, and in 800, 120 miles. The encroachment of the sea is effected almost entirely from the north-east, owing to the currents and the direction of the prevailing winds.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

THE ADVANCE.—*Alpine Chronicle*, April 7: The west drift is being pushed vigorously, with favorable indications. The working force has this week been increased, both in the mine and on the surface. Grading is going on for an extension of the mine buildings. This mine has been worked economically and energetically, and success is deserved, and we trust the day is not far distant when their pay ore will be reached.

NEW CABLE.—The new cable for the Exchequer holding works will arrive to-morrow and be placed in working order at once. The new cable will enable the company to sink their shaft 1,000 feet. It cost \$2,400 in San Francisco. The steel rope now in use at the Exchequer mine will be transferred to the I. X. L. holding works.

I. X. L.—The contractors for sinking the shaft 200 feet deeper will commence work about Tuesday next.

AMADOR.

MECHANIC MINER.—*Amador Ledger*, April 7: The rock now being taken out is of higher grade, and there is plenty of it. The attachment suits have been dissolved. **BOYANZA.**—The new holding works are in running order. The mill will be started up on rock from the sinking of the shaft.

CROWN POINT.—At a large outlay they have fitted up excellent holding machinery, and a No. 1 10-stamp mill. The body of ore operated upon has been of sufficient size to keep the mill going constantly, but the unwelcome truth has forced itself upon them, that the quartz was below the paying standard. Lately they have taken to sinking, and the cheering intelligence reaches us that last week a marked improvement in the quality of the ore was observable.

COMET.—This property, lately bonded by H. Rees and others, has again changed hands. John A. Hall, the well known mining man, has taken hold of the claim and intends to go right after the ore. It is not known whether a mine exists in the locality, but the spot is considered a likely one for quartz.

MINER BONDED.—H. I. Bostwick informs us that he has bonded a mine, situated a mile from Jackson on the road to Mokelumne Hill, to Horace Adams for the sum of \$3,000.

CENTENNIAL.—Reports from this mine, located on Dry creek, continue favorable. The shaft is down 60 feet, the ore body holding out both in size and richness. Appearances favor the conclusion that the Centennial is destined to become one of the solid mines of the county. The Italian owners are happy over the outlook. The opening up of this mine is invested with additional importance from the fact that it is situated in a stretch of country along the mother lode scarcely touched by the prospector, but supposed to be as rich in precious metal as any portion of the belt.

BECK.—The new company for operating the Beck mine consists of Captain Beck, W. A. Nevilles, J. H. Zuercher and John Clements; W. Clements, Secretary and Treasurer. The volunteer mill is being taken down, the contractors agreeing to have it erected near the mine for the reception of ore inside of five weeks. The ground embraced in the company's claim covers 5.22 acres, and the main lode—an extensive and fertile territory—efficient to keep down mammoth mines in full blast for a century. All the owners are practical men and mean business.

DAY WEATHER.—*Amador Dispatch*, April 7: It is now thought that several of the quartz mills in this county, which are being run by water power, will have to be closed down by the first of June unless the owners adopt the use of steam. This will doubtless have a depressing effect on the northern part of the county. It is not likely that those mills which get their water from the Amador canal will experience much inconvenience in getting water to keep them going during the entire year.

BUTTE.

BIO BAR.—*Oroville Mercury*, April 6: Some two weeks ago the Big Bar company held its annual meeting for the election of officers. From the report of the Superintendent it was deemed best to get some 500 feet of new pipe, a new chief of the latest size and open up in a new place, as there was an abundance of water for the present. We learn that everything has been put in place and the water turned on. The company now have two chiefs at work, with plenty of water to run them until the first of August. It will be recollected that this claim was purchased from the Cramp boys the first of January for \$10,000, and has been fitted up since at a cost of some \$5,000. It is expected that the company will clean up a few of the upper boxes in a few days, and then will be known something of the value of the ground. Many good miners claim that it is a rich district and one that will last for years to come.

MINING MACHINERY.—We visited the "mining machine" last week. It was working well at the time going into the river, filling up with water, earth and rock, and raising them above the surface and discharging them into the sluice to be washed away, leaving the gold behind. Does it work? We have been asked a number of times. Yes, it does work, and works well, too, and in places where nothing else in the world will work. It pays, too. From the gravel taken out of the river during these experiments it has taken up gold enough to pay very well. In five hours' run the other day it took out \$30. While watching it work last Tuesday we took out our watch and timed it. It makes a revolution in a little over two minutes. That is, from the time it discharges one load of earth till it discharges the next, was a little over two minutes. Everything about it works like a clock. The machinery is made of these boats will be at work on the river, and then all can see how well they do their work. At present everything looks well.

CAVALERAS.

NUCKET.—*Calaveras Chronicle*, April 7: A nugget of pure gold weighing over seven ounces was found in a tunnel claim a few miles from town recently. The claim in which the *chipsa* was found was worked and abandoned years ago because it wouldn't pay. The relocators are making the ground pay handsomely, finding a good deal of coarse gold. And there are acres upon acres of ground abandoned in former years, in this vicinity, that would pay well for working. The ledge is little more industry connected with the pick and shovel fraternity.

BLAST.—Friday of last week a blast was exploded in Veith's hydraulic, one of the objects being to test a new kind of powder, designed expressly for bank blasting, manufactured by the Giant Powder Company. Four hundred and fifty pounds of the explosive were burned, as the society papers say, with happy effect.

ITEMS FROM COPPERHILLS.—Two companies of San Francisco capitalists are endeavoring to purchase the Honey Brothers gravel claims on Bowery hill, below Reynolds' Ferry, near the Stanislaus river, but they are not anxious to sell unless they can get their price. It has been pronounced by hydraulic experts the richest claim in the county, if not in the State, as the gold is well distributed through the gravel from top down to bedrock. Their calculation is that it will clean up by hydraulic process \$20,000 per month for five years.

UPPER COUNTRY ITEMS.—The Granite mine at West Point, owned by White & Co., has been bonded to a San Francisco company and preparations are being made for the immediate erection of a mill. Good rock has been struck in the Buckhorn mine, owned by the Enterprise Con. mining company. The ledge is of the best and prospects extremely favorable. The new mill on the Zacator is approaching completion. Excellent rock is being taken from the mine. Champion, still stopping and crushing. At Mosquito, Garland's mill is running on rock from Gass & Co.'s mine. All the mines at Railroad flat and Independence are looking well.

INYO.

MOORE BULLION.—*Calaveras Chronicle*, April 7: The total value of bullion shipped by Moore mining company for March, up to the 30th, was \$73,373.

NEW COSO.—Nos. 1 and 2 of the New Coso furnaces have been running steadily during the week, but with what success we are not informed. No. 3 has not yet been started.

RUMORED STRIKE.—There are rumors of a huge strike having been made over in the Lookout, it being a new discovery. It is said the ore assays up into the "several thousands."

SANTA RITA.—We made another visit to the furnace of the Santa Rita mining and smelting company last Wednesday. There remains very little more to complete the machinery and pipe connections, and in two or three days we shall see the black smoke ascending from the furnace. Mr. Fortune was on the furnace dump receiving and weighing ore, but he was unable to take a full count of the work. We were shown through the assay office, at a convenient distance from the furnace, and some excellent buttons were exhibited, obtained from assays made by Mr. Fortune, going all the way from \$40 to \$190 per ton in silver. The Hidalgo mine produces the ore and it carries 20% to 55% lead, there also being sufficient iron ore combined with the silver and lead ores to make all easy to smelt.

CERRO GORDO.—Cerro Gordo has been for some years and is yet a dull place, not at all comparable to the good old times of yore. Only one furnace is in operation, and as no great number of men are employed to provide ore for it, while nothing at all is going on in the camp outside of the operations of the Union company, it is easy to see that these dull times will be complained of as long as no new developments shall be made or another expedition come into camp. Work in the new shaft is progressing steadily and it is confidently hoped that a good deposit of ore will be found shortly. A drift, for the purpose of cutting the Omega, has been commenced at a depth of 700 feet, and is being pushed rapidly, while at the same time the sinking of the shaft is continued. The calculations, I believe, are that the shaft will cut the Union vein at a depth of about 1,000 feet, while the 700-ft. level will cut the Omega within about 150 feet and the Union within about 350 feet. Christ Crohn is still pushing on his prospecting in the San Lucas canyon. Having expended already so much money on the claim he does not like to abandon it, and the ledge at the same time shows in such a manner that a person would expect to make a good strike every day. At the Belmont, the mines of Dr. Heller and K. C. Johnson are leased to a party of Mexicans, who are taking out considerable high grade ore. The ledge in the shaft of the Oceola shows very well, carrying over a foot of rich ore, with finely developed walls, with every prospect of being permanent. They will sink about 50 or 60 feet deeper and then run levels, when they hope to take out a good deal of ore or endeavor to sell the claims.

NEVADA.

KENTUCKY RIDGE.—*Grass Valley Union*, April 5: Work at the Kentucky Ridge mine is being prosecuted with all due diligence, under the efficient supervision of Mr. Jos. Snyder. Work in the upper tunnel is being prosecuted night and day. This tunnel has been driven westerly 125 feet on the course of the vein and easterly for 60 feet. Free gold in good quantities is shown wherever the ledge is exposed. Panings from any part of the mine and from the croppings of any part of the ledge give large results in free gold. The ledge is all the way from 18 inches to two feet in thickness, well defined and has splendid walls. Numbers of our miners and business men have visited the Kentucky Ridge, and all agree as to the fine appearance of the property. A mill is wanted on the ground, as there is already enough ore on the surface to last a 10-stamp mill for two years. Some of the stock is being sold in order to raise a fund with which to erect a mill. This stock is being generally taken by Great Valley people who have visited the mine. As soon as the mill is erected two Ingersoll drills will be put into the lower tunnel. The compressor for the drills will be run by the same machinery which will drive the mill. Water power will be used, of which there is an abundance for all purposes.

BULLION MINER.—Work on the Bullion mine is about being commenced in earnest, under the direction and superintendence of Mr. Dodsworth. Steam machinery is about being put on the ground, and then regular and systematic work will go forward. The Bullion has heretofore given out fine ore, and the present owners of the property have every confidence that there is plenty more of it remaining in the ledge.

PLACER.

STRUCK IT RICH.—*Placer Herald*, April 7: A. T. Molin, a very estimable gentleman, who has been prospecting for quartz more or less in this part of the country for the past year or two, showed us some specimens about a week ago, which he had taken from a ledge about two miles north of Auburn, and within only a few hundred feet of the old Calf Pasture mine, that were, to say the least, extremely rich, the free gold showing plainly all over them. The ledge is well defined and indications are that this rich lead will prove extensive. Many who saw the rock pronounce it the richest that has been taken out in this part of the country since the memorable strike made by W. G. Green some years ago. We understand that one piece of rock taken out by Mr. Molin this last week is estimated to contain at least \$500 worth of gold.

MINING ITEMS.—*Dutch Flat Forum*, April 5: The Southern Cross and Polar Star claims, belonging to A. Hayward, are running steadily, using about 1,800 inches of water, which is alternated from one to the other in such a manner as to wash to the best possible advantage. A powder drift is being run in the latter, on the bedrock, in which 250 lbs of powder will be exploded in a few days. The Elmore Hill claim, belonging to a San Francisco company, is being worked in a very economical manner, and is sending out a large quantity of ore. The Franklin claim, owned by a San Francisco company, is being opened on the right principle, and is now in condition to work to advantage, but cannot expect large pay until the pit is advanced nearer to the channel. The Baker claim, owned by the Cedar Creek company, is the most important enterprise in this district, for on its results, more than any other property, depends the future prosperity of the county. We understand that the claim is being managed and every effort exerted to make it a success. It is being opened in the most scientific and practical manner. The pit was commenced on the rim and has been extended back into the hill, in the shape of an A, till the point has reached the shaft, down which the gravel drops into the Yankee tunnel, 90 feet below. On the outer side of the opening powder, blasts are being prepared, additional to the one mentioned last week, which will be exploded in a few days, after which the claim will be in condition to wash almost continuously, piping on one side while the work of removing boulders is progressing on the other, with room in the center for the derrick, and ample area of clear bedrock in its rear to pile back all of the large rocks. This claim is using 1,600 inches of water and is running the dredge continuously. The claim will permit. Up to this date, however, it has only been enabled to use water about six hours out of the 24. We are informed that even with the extra expense of opening and consequent disadvantages under which the work has been done, and notwithstanding the fact that the bank washed to this date had been drifted, the claim is showing a good deal of working expenses, which being the case, having now passed the drifted ground, the Cedar Creek company may be assured that it has a bonanza ahead. The Star and Union, belonging to the same company, being one of the Yankee series of claims, is still washing nights and removing boulders during the day time. This has turned out to be quite a profitable claim. The Summer-sett, Pacific and Illinois continue washing. At Gold Run, where Bonanza and Ford continuously continue working. The Gold Run claim is about exhausted on the present level; only a few days' washing remains, when it will be numbered among the things of the past until such time as a deep bedrock tunnel is run, so as to tap the bottom, which will probably not be for years to come. The Cement mill is doing well and is an example of persever-

ance and economy. Our ditches are running full of water and our claims are doing well.

LOWELL HILL.—The Swamp Angel company have completed the furnishing of their mine with four-inch air pipe. The work of breasting out, extending the main tunnel and opening up new drifts is now progressing under favorable circumstances.

REASONER HILL.—Ground sluicing is the only work now progressing in the Rhode Island mine, as there is not sufficient water for hydraulizing. The Wide West company are making good progress in advancing both tunnels. The gravel has been finally lapped in the tunnel No. 1, and is said to be equally as rich as that found in tunnel No. 2, thus showing it to be very extensive as well as rich.

BET MINER.—The Walooopa and Neece & West claims have made one general clean-up during the season and are now washing. The water having given out, the Red Dog has shut down. The Nevada mining company are washing with three streams.

SIERRA.

IOWA.—*Mountain Messenger*, April 7: The Iowa company have struck excellent gravel, and are now following the bedrock to determine the extent of the claim.

The Michigan company, at Gibsonville, have every reason to think they have a very valuable property.

GERMANIA.—The Germania company have their shaft down 60 feet. Work has been discontinued for the present. The best plan for developing their ground is said to be by means of a tunnel, 70 feet in length, aided by a double shaft, with a regular windlass.

An extra dividend of \$1.25 per share was paid Saturday by the Empire mining company.

NOT DISCLOSED.—The report that the Bald Mountain company had discharged about 60 men proves to be untrue. None have been yet and will not be until water fails.

TIMBER CONTRACT.—Jake Winans was awarded the contract for furnishing the Bald Mountain mine with timbers for the coming year. It is about a \$10,000 job.

INDEPENDENCE.—The Independence mine having fallen into the hands of the Sierra Buttes company, preparations are being made to pump up the water and take out quartz. To this end machinery is being made at the foundry. New Labor.—Joseph Middlemiss, with others, has commenced opening the Ante-Up, formerly known as the Sierra ledge, this side of the Mountain house. It is four feet in width and of the finest quartz formation in this section of the country. Machinery can be run by water power. About \$20,000 has been taken out here in years past.

TRINITY.

A GOOD LEDGE.—*Trinity Journal*, April 7: Recent work by the Lyder Bros., at the Bullychoop quartz ledge, would indicate that this is the richest one of the richest ledges in the State. From the last two weeks' crushing, about 10 tons of rock being worked, \$1,340 was cleaned up, which was brought in by B. S. Gupitill, last Wednesday, and sold to M. F. Griffin. This is rich rock, probably selected. We are informed that about three feet of the ledge will pay an average of \$100 per ton, while the whole ledge will yield \$10 to \$20 per ton for crushing.

EXPOSURE QUARTZ LEDGE.—In accordance with advertised notice, a meeting of parties interested in the above ledge was held at Junction City last Saturday afternoon. A company was organized and a conditional agreement entered into to purchase the ledge from Mr. Engel for \$10,000 after prospecting, 12 months time being allowed for the purpose.

TRINITY CENTER.—*Cor. Yreka Union*, April 5: The mining interests here are well cared for, and the prospects for a profitable assay are better than for years past. The hydraulicers are joyous with much water, and the placer miners are working for dear life while the moisture lasts. Bloss & McElroy, who have been working very rich ground for years, with insufficient dump and fall, now begin to see their way clear—that is, they are pushing farther up into the hill near town, and are able to raise the head of their tunnel the more water is level. Another season will enable them to carry tailings clear to the river without obstruction, when the expense of clearing the dump will be obviated; and that has been as great as the cost of cutting down the bank. George Allison has struck it rich where no one thought there was any pay at all.

TUOLUMNE.

NEW DRIFT.—*Tuolumne Independent*, April 7: Geo. F. Sharp, Esq., of San Francisco, has secured a water right and has located 5,000 inches of the Main fork of the Stanislaus river, to be taken from a certain point and conveyed in ditch, flume and pipe to the Philadelphia mining district and Colusa vicinity, to be used for mining, milling, manufacturing and irrigating purposes. From the starting point (the dam erected by the Miners' ditch company) the water is to be taken down the left bank of the stream to a connection with the Miners' ditch, thence on the same grade to the Old Tunnel, at which point a branch ditch will be run to the head of Rose's creek, to a connection with the Philadelphia mining company's ditch. From the tunnel the water will run into the South fork to a point, thence by ditch and flume to Colusa and vicinity, the flume and ditch to be nine feet on the bottom.

Nevada.

CON. VIRGINIA.—*Gold Hill News*, April 11: Daily yield, 350 tons of ore, keeping the mill running at capacity, their full capacities. The ore extracted from the slopes on the 1850-ft level is rich, while that taken from the southwest slopes on the 1550-ft level is of the uniformly high grade. On both levels the slopes are showing well at every point. The main south drift on the 1650-ft level has penetrated a distance of 133 feet from the north line, the entire distance being through rich ore. This drift has run out 85 feet yet to run to reach the corner with the deep winze. The yield of bullion to this date, taken along with the prospects for the remainder of the month, warrant the assertion that a payment of the old dividend of \$2 per share, aggregating \$1,080,000, will be resumed in May next. On the 1200 and 1300-ft levels the connecting drifts and air passages are being enlarged and put in working condition preparatory to extracting the lower grade of ore left in the drift. It is confidently expected that many thousands of tons of this low grade ore which can be worked very advantageously and made to pay well whenever it is desirable to do it.

CALIFORNIA.—Daily yield, 400 tons of ore. The ore slopes are looking well and yielding rich ore in every part. The mills are kept steadily crushing ore, and the future prospects of the mine are far in advance of what they are at the time of the declaration of the first dividend one year ago. There is now more ore in sight than there was at that time, and the developments since made on the lower levels show the width and richness of the ore vein to yet continue downward to undetermined depths. The run of the mills to the present date in this month has had no interruption, and the yield of bullion is fully up to the usual standard. It is confidently expected that a depth sufficient for the opening of the 1700-ft level station will be attained by the first of May next.

LADY WASHINGTON.—The east drift from the bottom of the winze on the 950-ft level is in 46 feet, the face this morning just having cut a heavy clay slip and entered what appears to be not only a fine ledge formation, but which carries with it every character pertaining to the opening of a rich ore vein. This vein has a direct tendency to the northwest and southeast, which would carry it directly in the course of the ledge now being opened upon by the east drifts from the Overman shaft on the 1300 and 1400-ft levels. This new discovery is coming at a most opportune time.

OVERMAN.—The main east drift on the 1400-ft level is steadily advancing, as fast as the flow of water and the blading will permit. On the 1200-ft level a cross-cut has penetrated the ore vein 100 feet south of the shaft, disclosing 23 feet of low grade ore, very regular in its formation and interspersed with spots and streaks of ore that will assay richly in both gold and silver.

JUSTICE.—Daily yield, 400 tons of ore. The ore slopes

at all points on the 400 and 700-ft levels are showing well. The mills are all kept steadily crushing ore from the mine, and the addition of the Eureka mill with a crushing capacity of 200 tons per day has been added to the reducing force during the week. On the 1000-ft level the south drift is opening up splendid ore, and the prospects now are that the 1000-ft level will prove the best of any in the mine.

YELLOW JACKET.—The new shaft is down 622 feet; the flow of water is about the same as heretofore reported, and sinking is making good progress.

BULLION.—The north drift on the 1500-ft level is making steady progress, the face in quartz and ledge matter. The east drift on the 1600-ft level is still slowly advancing, the flow of water being quite strong in the face. This water is still intensely hot, and the drift can only be advanced by the most careful and judicious management.

MEXICAN.—The west cross-cut on the 1700-ft level is still in favorable ledge-matter. The north drift on the 1405 level is steadily advancing to the northeast, following the east wall of the ore-vein. An upraise has just been started on the ore recently opened up on this level.

BELCHER.—Sinking the main incline is making good progress. Sinking the combination drift shaft is making excellent headway. Driving the prospecting cross-drifts on the 1800-ft level of the drain shaft is also making excellent headway.

ALTA.—Sinking the shaft is being pushed forward with all the vigor possible, the bottom being in soft porphyry mixed with streaks of quartz which begins to look as if the ore vein might not be very far away.

ATLANTIC CONSOLIDATED.—The ledge in the face of the tunnel is steadily increasing in size as the drift advances. The ore in the face assays richly in silver.

HOMESTRAD.—Sinking the shaft has been temporarily suspended to make necessary surface improvements.

OPHIR.—The flow of water at the bottom of the main incline is gradually abating, and sinking the shaft has been going steadily forward. Preparations for lowering the pumps to the 1800-ft level station is going steadily forward.

SAVAGE.—The water has several times been rapidly lowered during the week and then again allowed to rise. It now stands in the shaft at just about the same point that it did at this time last week.

SOUTH COMSTOCK.—The sinking of the shaft deeper, for the 500-ft level, is actively going forward at a very good rate of progress, and is to-day 148 feet below the 300-ft station, with the bottom in very promising vein-matter.

SILVER HILL.—The north and south drifts on the 550-ft level are each being steadily driven ahead. The face of the south drift is in very encouraging quartz, with excellent ore prospects.

LEVATHAN.—The main drifts north, at the 600 and 650-ft level, are both being pushed ahead at the usual good rate of progress.

EMST & BELCHER.—Cross-cut No. 1 is in very favorable porphyry, with streaks of quartz. Cross-cut No. 2, near the centre of the claim, is in hard porphyry. Cross-cut No. 3 is in soft, favorable ground.

CROWN POINT.—The east drift on the 2000-ft level is steadily advancing, the face is in much softer ground, and evident indications of soon reaching the main ore vein.

CALEDONIA.—The east cross-cutting on the 1200-ft level is going steadily forward. Sinking the shaft has been somewhat retarded for the past two days by a very strong flow of water.

SOLID SILVER.—Main drift north, and cross-cuts both east and west from it, all showing finely in very promising vein matter, with good streaks of ore of both high and low grade coming in, especially in the east cross-cut.

BALTIMORE & AMERICAN FLAT.—The northeast drift on the 400-ft level is steadily advancing, and the ore vein to drain the water encountered in the bottom of the winze below the 1050-ft level.

SUTRO TUNNEL.—Total length of tunnel to-day, 16,547 feet. The face of the header is in ledge porphyry, with streaks of quartz and clay. This material is easily excavated, but requires careful management and good substantial timbering.

THE EAST DRIFT ON THE 400-FT LEVEL IS IN soft, favorable matter, carrying every evidence of a steady and near approach to the ore vein. The character of the rock penetrated is encouraging.

CHOLLAR-POTOMI.—Daily yield, 110 tons of ore, the assay value of which is \$26.50 per ton. The east prospecting drift on the 1785-ft level is steadily advancing, the face in very favorable ledge formation.

THE PUMPS.—The pumps are working splendidly, and only need to run at the rate of one stroke per minute to keep down what little water is now coming in at the bottom.

JULIA.—The face of the main south drift on the 1800-ft level is still in very fine quartz and low-grade ore. The vein at this point appears to be widening, and the chances for a paying ore development are undoubtedly on the increase.

HALL & NORCORSE.—Much trouble has been experienced during the week with the small pumps below the 1000-ft level.

NORTH CON. VIRGINIA.—Sinking the shaft is making steady progress, the bottom in very favorable blasting ground.

FLORIDA.—The west prospecting drifts on the 815-ft level are steadily advancing in favorable quartz and ledge matter.

UTAH.—The west drift on the 1150-ft level is steadily advancing, the face in very hard blasting ground.

SUCCESS.—The shaft bottom is in good blasting ground, and the flow of water is still easily handled.

NEW YORK.—The enlargement of the pump shaft is going steadily forward.

BLACK ROCK DISTRICT.

ENCOURAGING.—*Eureka Sentinel*, April 4: There is quite an excitement in town over the new discoveries in the Black Rock district, some 40 miles west of Eureka, in the vicinity of Roberts creek, and in the same range of mountains as Cortez district. Some 60 men are on the ground prospecting, taking up ledges and locating water rights, and as many more are preparing to try their fortunes in that region. Quite a large amount of rock has been brought to town, and assays range all the way from \$40 to \$100 per ton. Mr. Brooks, who has largely invested in the new discovery, informs us that the ledge has been traced a distance of 600 feet, and has an average width of five feet at the croppings, with numerous branches and spurs putting off into the outlying formation. In the rock brought to town the characteristics are much the same as the ore from the Hunter district, and antimonial or ruby silver can be plainly seen with the naked eye. There is plenty of wood and water in the immediate vicinity. It is the intention of some of those interested to sink a shaft on the ledge for the purpose of demonstrating the value of the new mine.

ELY DISTRICT.

RAYMOND & ELY.—*Pioche Record*, March 31: Nothing new to report in regard to the working of the mine. One piece of spur-wheel is still on the road, and will probably arrive during next week. The spur-wheel will be put in running order during the coming month. The Raymond & Ely 30-stamp mill started to work on Monday last, 10 stamps being kept to work crushing ore and the principal portion of the pans and settlers being devoted to the grinding of the ore. Ten cars loaded with ore were dispatched to the 30-stamp mill on Thursday last for reduction.

ALPS COMPANY.—The Alps mill having closed for repairs, the Condor mill is now running night and day on custom ore. The Alps mine is looking well, having a good prospect and some ore being extracted.

ROCK CREEK DISTRICT.

THE FALCON.—*Tuscarora Times*, April 3: There are a number of very promising claims in the Rock Creek district, distant about 15 miles from this place. The Falcon is the only one on which much work has been done, and in the opinion of experts who have examined it, it bids fair to become a valuable property. The ore of the district is immensely rich in rubies and antimony. A great vein will be built from Tuscarora this season and work will be prosecuted on a number of locations, includ-

THE ENGINEER.

Tests of the Niagara Bridge.

It has been noted in the telegrams to the daily papers that the suspension bridge across the Niagara river had been closed for the purpose of testing the condition of the supporting cables, etc. These tests were made most thorough and resulted in the complete assurance of the safety of the structure after 22 years of use. This is a great point in the history of suspension bridges, and some notes of the examination will be of interest to all engineers. We find the following in the *Buffalo Commercial*:

Out of the 14,560 wires constituting the four mammoth cables supporting the structure, less than a dozen were found seriously corroded, and these were in the first anchorage examined. In short, the removal of the masonry revealed the fact that the bridge is perfectly safe; the number of wires damaged (which will be immediately spliced and replaced) are so few compared with the whole as to be hardly worthy of mention.

After removing the preparation of Spanish brown paint, oil and cement, with which the wires had been covered for preservation, they were found to be in perfect condition, the iron in an excellent state of preservation and the grain of the metal distinctly marked and clearly traceable. To be sure, spots of rust were here and there to be seen on the surface; but, with the exception of the dozen wires already mentioned, no material damage had been done. That the metal had undergone no apparent change since it was placed in position could be readily discovered by any casual observer. This, however, was not satisfactory to Col. Paine, and he has made a series of experiments which will be likely to attract much attention in the scientific world. They show conclusively that the long use of the bridge, the jarring and straining to which the wires have been almost continually subjected for nearly a quarter of a century, have not in the least impaired the quality or tenacity of the iron.

In constructing the suspension bridge Mr. Roebling provided for the expansion and contraction of the wire by placing the bed-plates which receive the cables on top of the towers on rollers, thus permitting an easy backward and forward movement. In the first experiment, that part of the cable which was feared might be damaged was carefully measured by an instrument used for such purposes, and which is capable of marking one ten-thousandth part of an inch. A heavy freight train was then run on the bridge and the stretch of the cable noted. It is not necessary to go into details here, or give figures. It is sufficient for the purpose of this article to say that the elongation of the wire was very nearly what the formula used by engineers for ascertaining such results showed the stretch of a perfect cable constructed like this one should have been under a similar strain. This furnished conclusive evidence that the elasticity of the cable as a whole had not been in the least impaired by 22 years' service or by corroding. In the second experiment a single wire from one of the main cables was used. For this test the binding holding together the 520 wires was removed, leaving each perfect freedom of action. Three wires were then selected, a fine knife mark was drawn across them, and the middle wire cut at one of the marks. The instrument above referred to was then applied, and indicated that the severed wire had contracted within a fraction of what it should when relieved from its portion of the weight of the bridge. Here again it was demonstrated that the metal had lost none of its elastic quality. For the third experiment one of the wires was detached from the cable and subjected to a dead weight until it broke. If the nature of the metal had been altered, or the adhesiveness destroyed to any extent, the wire would have broken off like a piece of cast iron. Instead of doing so, however, it stretched out under the pressure until at the point of separation it was not one-half its original size. It would be hard to conceive of anything that would show more plainly than this that the iron had not been injured. One of the guys extending from a cable to the body of the bridge was next taken and subjected to a dead weight. The construction estimate places the maximum burden which it would ever be required to bear at 15 tons. It parted under a pressure of 33 tons.

It was also noticed that when a wire was removed from the cable it at once assumed a curved shape. If the circle was completed, it would be a little over five feet in diameter. By communicating with the man who received and prepared the wire for its place (he is now at work on the New York and Brooklyn suspension bridge), Col. Paine learned that this wire had been coiled on a drum two feet in diameter, and that it had been subjected to a straightening process which took about half the curve out of it. Here was more striking evidence that the spring of the wire had not been overcome. Other facts, all tending to show that the bridge is not impaired, could be cited, but these are sufficient.

A NUMBER of heavy Montreal capitalists have applied to Parliament for an act of incorporation preparatory to the organization of a company for the purpose of laying a cable between Canada and Ireland.

Strengthening Masonry With Iron Bars.

This subject was carefully studied by the builders of the East River bridge, and the following gives the results of their investigations. To provide against possible changes of form or accident during construction of the arches, the following precautions were taken:

At the top of the third vousoirs four heavy irons were anchored into the masonry on each side of each arch, to which three-inch iron rods spanning the arches were attached. Each rod was provided with a turn-buckle for tightening. Aside from serving to stiffen the arches, these rods served a very convenient purpose, as supports for scaffolds while removing the centers and pointing the joints.

Permanent strengthening bars were inserted in both the first and second courses over the arches, there being in all six bars, five by one and a quarter inches, over each arch, anchored well into the shafts on either side.

Experience has shown the necessity of another precaution to obviate the evil effects of the unequal distribution of pressure over the base of the masonry. By simple inspection it will be seen that the pressure per square foot at the base of the connecting walls is less than half of that at the base of the shafts. Hence there would be a tendency towards less compression and settlement under the connecting walls and a consequent bulging upward at the roadway, causing vertical cracks in the connecting walls. This actually occurred to a limited extent in the Cincinnati bridge. To obviate this tendency, bars were inserted in top of the fourth, fifth and sixth courses below the roadway, in all 16 bars, five by one and a quarter inches, long enough to anchor into the shafts. In addition, the stones of the connecting walls for several courses were clamped together by one and a half inch round iron clamps.

Three sets of two by ten-inch steel bars were inserted at each side of the pier, at the roadway, to serve as attachments for the under floor storm cables.

A set of flat iron bars were inserted at 20 feet below the roadway, as attaching points for holding down stays.

Twenty bars, five by one and a half inches, reaching entirely across the tower, were inserted in the top of the second course below the saddle-plates; and in the course below this, 16 other bars, five by one and a quarter inches. The ends of these bars serve as attaching points for a portion of the long stays to the river and land spans of the roadway.

Small irons were inserted at frequent intervals to serve as attaching points for scaffolding, stairway, etc.

On each pier, on specially prepared beds, four saddle-plates, each eight by 16 feet, and weighing 11 tons each.

All irons were thoroughly galvanized before insertion. The saddles and plates were thoroughly coated with boiled linseed oil.

Steel for Bridge Building.

The use of steel in bridge building in England, says the *Railway World*, has been delayed by the fact that the Board of Trade has never investigated the subject of its adaptation; and its regulations directly opposed the innovation. Sir John Hawkshaw had several times desired to use it in place of iron, but did not do so because he would have to stand the responsibility of possible condemnation. At the suggestion of Mr. W. H. Barlow, a committee of the British Association was appointed in 1873 to correspond with the Board of Trade on the subject. The result was the appointment of a committee by the latter body for the purpose of ascertaining the proper coefficient of steel. The committee consists of Colonel Yolland, representing the board, and Sir John Hawkshaw, the eminent civil engineer, and Mr. W. H. Barlow, on the part of the scientific public. These gentlemen have since been engaged in this difficult work, and have now completed their report. They considered only the kinds of steel subjected to actual fusion, and have investigated the subject thoroughly. If their report is adopted by the Board of Trade, the result will be that steel will hereafter largely supersede iron in bridges, as it has in rails. The advantage of steel is its comparative economy considering the quantity required for a given purpose. The chief gain is in lightness and strength. The Menai straits bridge, for instance, is composed of four iron tubular girders, weighing in the aggregate 6,000 tons. If it were an open girder of steel the weight would be less than half of that, and cost consequently very much less. Spans can safely be built of steel of a length which it would be impossible to build with iron on account of the great weight of the amount required. Holland has built many steel bridges, and the material has been used in this country in the St. Louis and the Brooklyn bridges. With steel produced at so little cost above iron, as is now the case, it would not seem improbable that it may supersede that material in bridge construction as completely as iron has supplanted wood.

SALT BORING IN CANADA.—The new Canadian salt field, the rock-salt borings in Goderich, is on the east shore of Lake Huron. The borings were originally made in 1866 for petroleum; but while they were unsuccessful in that line, springs of salt-water were found at a depth of 990 feet. From this good salt was secured by evaporation. But the idea occurred to the owner, Mr. Henry Y. Atrill, to try mining the

solid salt, as in Poland. And so with a diamond drill, under Prof. Hunt's direction, borings have been made to a depth of 1,517 feet, which, among other things, have revealed a double stratum of solid pure rock-salt, divided by a seven-foot layer of rock. This at a depth of 1,085 feet. The total impurity contained in this salt is less than one-quarter of one per cent., or only one-eighth of that contained in our other American salts. These facts have persuaded Mr. Atrill to begin mining this salt this year; and for this purpose Mr. Heinrich has been engaged. The importance of this enterprise is very great. It will much simplify and cheapen the production of salt in this country, and will supply an article of unique purity. The annual production of salt in the United States by evaporation is now about 18,000,000 bushels.

The North Sea Canal.

The new direct canal between Amsterdam and the German ocean, which brings the commercial capital of Holland within three and a half hours' journey of the sea, and of which we gave a description two months ago, is thus far a decided success. The first two months' working returns give evidence, if the proportions of tonnage are any guide, that it is more important to British than any other foreign interests. The canal was opened on November 1st, and in that month it was passed on their outward voyage by 45 steamers, two full-rigged ships, seven barques, 13 brigs, 13 schooners and three galliots, making 83 vessels, of a total burden of 27,208 tons. On their homeward passage it was used by 39 steamers, two barques, one schooner, four galliots; in all 46 vessels, of a total burden of 15,428 tons. In December 41 steamers, one full-rigged ship, seven barques, five brigs, nine schooners, one smack; in all 64 vessels, of 19,669 tons burden, passed outwards. The inward-bound vessels were, as before, naturally fewer, for the canal and its sea harbor of Ymuiden are better known at Amsterdam than to charterers in distant ports. The inward-bound vessels comprised 37 steamers, one full-rigged ship, five barques, one brig, five schooners, one galliot; together 50 vessels, of 18,864 tons joint burden. Among the vessels which passed in these two months more than half were under English colors. In November there were 23 outward-bound English vessels, of 9,665 tons in all; 31 inward-bound, of 10,130 tons. In December the outward-bound English vessels were 26; and the tonnage 8,155; the inward-bound were 30, and the tonnage 9,890. The greatest draft of water of any of the vessels which passed was 18 feet eight inches. The least draft was five feet eight inches. Dredging continues, and it is expected that in August vessels drawing 24 feet of water will be able by this canal to enter the port of Amsterdam.

Improvements in Smelting.

We often hear among the practical workers, says the *Eureka Sentinel*, a certain amount of contempt expressed for those who bring scientific training into the ordinary vocations of life, and much satisfaction is expressed when those that theorize reduce their knowledge to practice and fail temporarily in their experiments. The contempt for knowledge by those who have learned their pursuits by simply working for their daily bread and acquired their training in contact with their labors is a great drawback to advancement in their chosen professions, and when at any time there comes an improvement or step in advance, these men are left high and dry, for the reason that they are unable to comprehend anything that departs from the regular routine. Take smelting for an example. When it was found that the ores of this district could only be worked by this process, although it was by no means a new one and had been carried on for centuries in other countries, the greatest difficulty was experienced in constructing a furnace that would successfully treat the argentiferous ores. With all the advantage of the experience of other workers in the same field and the supervision of an able and scientific man, the first furnace, although it proved that the ore could be smelted, still was, financially, a dead failure. But the fact that the ores could be treated was encouragement enough for the sanguine owners, and they went on testing and experimenting until financially as well as theoretically the furnace was a success.

Looking back to what was termed a success eight years ago, one wonders at the crude work of the time. On the 30th of June, 1870, the product of seven furnaces, for a six months' run, was 959 tons of bullion, valued at \$314,000. Allowing that these seven furnaces made a steady run of 90 days during that period, and that each ton of bullion represented six tons of ore, we find that the reducing capacity of a successful smelting furnace was, eight years ago, nine tons and a fraction of ore per day, which just about equals the bullion producing capacity of the present time. A practical smelter of the present day smiles at such a showing, but those furnaces were the result of 200 years' progress. Messrs. Keys & Arents, who had charge of the Bateman furnaces, noticed that much delay was caused by the process of tapping for lead, and introduced the automatic tapping apparatus known as the lead well, which is nothing more than a pipe starting from a kettle outside the furnace to the bottom of the crucible. This simple improvement, which was the result of observation and science combined, prevented the forming of horses, lightened the work of

the smelters, permitted the running of the furnace more regularly and consequently increasing its capacity, while the bullion was much purer than that obtained by the old-fashioned process.

Progress.

We have hardly space to trace further improvements, but the reducing capacity of the furnaces was gradually increased until it is nothing uncommon now for one of them to smelt 80 or 90 tons of ore, and produce from 10 to 15 tons of base bullion.

Nor is this the only direction in which improvements have been made. Repeated experiments by Guido Kuestel, in the latter part of 1870, showed that the loss in the slag and iron and volatilization reached an average of 35 per cent. of the silver and 43 per cent. of lead, contained in the ore. This loss was enormous. No wonder the old dumps assayed as high as \$80 in silver and gold. At the present time the slag runs with a mere trace of gold and silver, and the iron rarely exceeds \$20 per ton, and oftener averages from \$12 to \$15, while the loss by volatilization has been reduced to a low figure. An experiment in this connection—an interesting experiment—has come under our observation. One of our progressive superintendents, not satisfied with the returns of a furnace, introduced a system of competition, placing two practical smelters at work alongside of each other. Both being on their mettle, the utmost care and attention was bestowed on all the details of the work, extending to the minutest matters, and, roused out of the usual routine that had prevailed, this rivalry was productive of the most satisfactory results. The furnaces, responding to the care bestowed upon them, run through a greater quantity of ore, and, still better, the percentage of loss decreased in a corresponding ratio, showing at once that all that was needed was an application of brains as well as manual labor. The superintendent, having demonstrated by his shrewdness what could be done where there was an incentive, will in the future tolerate no step backward, and the company profits by his intelligence communicated to the employees.

Charcoal Consumption.

In the item of coal consumption the same percentage of gain has been made; formerly from 45 to 50 bushels to a ton of ore was not an extravagant average, but at the present time under 30 bushels is the amount used. In drawing these few comparisons, our only object is to show that if we rest contented with the present condition of things we will find that other localities will soon be sneering at us as being old-fashioned. Many imagine that we have reached the acme of smelting and that no further progress is necessary. To these loiterers, by the way, we will say that as long as any loss exists there is plenty of room for improvement, and to those who will bring brains as well as their manual labor to bear on the problem the reward is almost certain. There is a field for the employment of it in studying the combinations of the ore and the different fluxes necessary to its successful reduction, also a certain appreciation of any mechanical device that will lessen the labor and facilitate the working, and a chance for inventive talent in concentrating low grade ores and reducing the loss on high grade ores to a minimum. Intelligent labor is as highly appreciated in this locality as any other and will meet with due encouragement.

California Iron.

An effort is being made by a number of enterprising gentlemen to open up the vast iron deposits lying in this county, a few miles above Auburn, on the line of the Central Pacific railroad. Whether it will succeed remains to be seen. If it does there is little doubt but it will lead to a business second in extent and pecuniary benefit to no other on the coast. The subject has long ago been thoroughly analyzed, the costs and profits fairly computed and the question of remuneration comparatively set at rest; but all this, seemingly the only essential matter, is not sufficient to insure a prosecution of the enterprise. Counter agencies known to be very powerful are in such cases always at work, and these are they whose trade would be impaired by the opening here of such works. California at present is a growing and remunerative market for iron, which both foreign and Eastern dealers know, and it is to their interest to do all they can to retain our trade, which they could not do should we go into the manufacture of the material ourselves. Hence, we say it is fair to presume that they have their agent laboring to destroy our enterprise in this direction. England and France long endeavored to destroy the production and manufacturing enterprise in the Eastern States that they might retain the trade of America, and though we have no positive assurance for our surmises in this particular case, we give it as not improbable that the Eastern States are now exercising similar influences on the productive and manufacturing enterprises of this coast. However, we hope our citizens will not allow themselves to be balked. The outsider's plea that he can furnish goods as cheap, is no argument. As a point of economy the question is, where does the money go to? We use iron and pay vast sums of money for it, and not one dollar of that money remains to enrich the country that produced it; whereby if expended for a home manufacture home gets the benefit and the country grows rich. —*Pleaser Herald*.

The Divining Rod.

A writer in the *Engineering and Mining Journal* gives the following reasoning concerning the working of divining rods, which we give for what it is worth: An acquaintance, an expert with the rod, measures the richness and value of the veins "indicated" by the force exerted on the rod as compared with the force exerted at a mine he visited, where the ore was of known quality and quantity.

I can understand, from my own experience, that equal attractive power might be exhibited in many places, under a great diversity of conditions. The different forms of chemical action among the different kinds of rocks and along their lines of contact, are such as to cause galvanic currents of considerable intensity. These will cause the rod to act, whatever may be the cause.

The well known property of pyrites and pyritous rocks to decompose on a large scale in presence of favorable aqueous and atmospheric conditions, give rise to an amount of galvanic action which is highly favorable to the action of the rod. To this I refer by the greater number of "indications" of this instrument.

Along lines where a rust or clay strata occurs on the wall of a vein formation, the rod usually gives signs of attraction, but I have yet to see any proof that this attraction is affected any more by presence of ores than by the presence of any other undecomposed rock. I have personally opened out two places where the rod experts, exploring on their own account probably, had reported "nothing there." In both cases I found perfectly defined veins, but without much decomposed rock. One of these was quite rich in ore, while the other showed no ore for 60 feet of depth.

I have personally investigated the workings at several other places where the rod gave negative results, and found surface and wall decomposition slight but ore, in some cases, quite abundant. I have never known, personally, of any discoveries of good ore deposits which were first pointed out by the rod.

A highly intelligent gentleman, with whom I have held some conversation regarding the rod, stated to me that with it he had discovered "hundreds of rich mineral veins" in a certain portion of the country. However, in answer to an inquiry as to the richness of the ores, etc., he stated that he "had not opened any of them yet."

Now his expression above shows the status of the so-called discoveries of the "divining rod." There remains no doubt in my mind but that galvanic-electric action along lines of contact, or in presence of decomposing mineral matters or rocks, or even in some cases vegetable matter, is capable of exerting an influence through the human body, whereby the currents concentrating in the arms and thence to a connecting link (the rod) show no attraction towards the source of energy. The fact that mineral veins and deposits are, from their very nature and position, frequently localities of the greatest galvanic action, allows a possibility of ore being found by the rod, in which case the one success consigns to oblivion the memory of thousands of failures.

The effect of "unconscious cerebration" of the operator, on the motion of the rod, is surprising, and some of its developments would give an impression of fraud, but I am of the opinion that the action is in most cases involuntary.

For instance, a rod was stated by the operator to only indicate certain metals and ores. Samples of these metals and ores were provided, together with others to which the instrument was not sensitive, and the rod, on trials, bent down to the samples it was said to be sensitive to, and to no others. In so doing, it bent in such a manner as could not possibly have been caused by the operator. He was then blindfolded, and the position of the samples changed without his knowledge. The rod would point to any specimen, but in no case so decidedly as when the operator could see.

Again, one of the samples to which the rod was most sensitive was placed under a glass cover (as a non-conductor), and the rod would give no sign of attraction, the operator not being blindfolded.

He was then blindfolded, and caused to believe that the sample was uncovered (when it really was covered with the glass), and a decided attractive force showed itself.

I attribute these results simply to the will-power of the operator, used, it may be, unconsciously, which, while it cannot entirely prevent the passage of exterior galvanic force through the body, can greatly intensify or diminish it, and also to some extent control its action, even outside of the person.

Hence we see that in any continued investigation of the powers of the "divining rod," the investigator should be, to an eminent degree, unprejudiced. In scientific investigation generally, the importance of this is fully recognized; but here we have a subject leading to a new and most interesting field to which prejudice has long barred investigation, and which is, from its very nature, more open to effects from personal bias than any other subject.

I think much useful and most interesting knowledge regarding phenomena of terrestrial electricity and magnetism, and also perhaps physiology and psychology, might be developed by a careful and unprejudiced study of the operations and powers of this "divining rod," so called, which seems to be simply a galvanometer with the human body as one of its constituent parts.

USEFUL INFORMATION.

Turning Electric Light to Practical Uses.

Rapid progress is making in developing electricity as a means of lighting workshops, streets and dwellings. The experiments, says the *Age of Steel*, have been numerous. The most important are in Paris, St. Petersburg, New York city and Cornell University, showing that the principle may be cheaply applied, and to any extent. The Russian experimenter gives the process he has successfully employed. A small tube of glass not more than six inches in length, filled with a pencil of charcoal, the air exhausted and the tube hermetically sealed. A moderate current of electricity is then passed through the charcoal from an ordinary electric-magnetic machine, causing it to glow with a very brilliant, but at the same time soft light. It is said that charcoal does not apparently suffer consumption, but lasts for an indefinite period, and that the strength of the current required is so small that 200 of these lights, at a considerable distance apart, can be easily maintained by a single machine. The inventor claims that he can light the whole city of St. Petersburg, both street lamps, stores, and private residences, by a single 15-horse power machine, with no greater cost than that of running the machine.

Prof. W. A. Anthony of Cornell University, Ithaca, N. Y., gives the result of his experiments. To the electro-magnetic machine, which was driven by a Brayton petroleum engine of five-horse power, wires were connected for conveying the electricity produced to a room some 300 feet distant, from which daylight could be excluded, for photometric experiments. In this room the wires were connected with a Foucault regulator for the electric light, the light being produced by the passage of the electric curve between two carbon points. The electric light being too brilliant for direct comparison with a tallow candle, a common coal oil lamp was used, having a flat wick one inch wide. The electric light was found to be equal to what would have been produced by 234 such lamps. But 234 such lamps would have consumed nearly 16 pounds of oil per hour, while the engine whose power developed the electric light consumed but six and three-quarter pounds of oil in the same time.

This light is in use in Paris and other parts of France and England, and shows that its cost is a mere trifle, while the capacity is only limited by the size and power of the machinery and appliances. The Northern Railway station at Paris was recently lighted by the agency of electricity, and arrangements are in progress to employ such means of illumination permanently. Last year, it appears, there were but two instances of the electric light being in ordinary use, viz.: at the Ducommun foundry in Muhlhausen, and Gramme's factory in Paris; now four other workshops in the French capital have followed suit, and are nightly lighted by the same brilliant medium. In England the light has been put into the workshops of two important establishments, with the highest degree of success.

Making Soap.

Most people in the country prefer home-made soap. They have the fat necessary in the shape of refuse lard, tallow, bacon, skins, etc., and the potash of soda can now be easily obtained for use with much less labor than was formerly required when the potash had to be extracted from the pile of wood-ashes at home. Where wood is used for fuel this is yet done.

If one has no home-made lye, buy caustic soda—you can get it at any apothecary's if nowhere else—and use it in this way: For hard soap take one pound of caustic soda, three pounds of fat, or five or six pounds of ordinary soap fat, and three gallons of water; put all together in a kettle over the fire and boil, adding three or four handfuls of salt before the boiling is quite finished; from two to three hours' boiling will be necessary. The experienced soap-boiler will know by its appearance when it has boiled enough. The novice will soon learn.

Where caustic soda cannot be obtained get common washing or sal-soda, and by the addition of lime make it caustic, after the following plan, which is the one generally in use at the present, and which makes an excellent soap: Take six pounds of washing soda and three pounds of fresh, unslacked lime; place together in any water-tight vessel—an iron kettle is best—and pour on two gallons of boiling water; stir occasionally until the lime is slacked and the soda dissolved, then allow it to settle. Take the clean lye from the top and pour it on the fat—of which three pounds common scrapings are to be taken—and commence boiling; then add another gallon of water to the settlings of the soda and lime, stirring as before. This lye is then to be added to the other while boiling; also throw in about six single handfuls of salt about half an hour before it is done boiling. Boil two hours.

Without the salt either of these methods will make a semi-soft soap; but for a real soft soap potash must be used. This you can buy for the purpose; or, if you prefer, extract from wood-ashes by simply mixing a little fresh lime with them and pouring on water. An old barrel or tub will do to hold them, if there is a hole in the bottom for the liquid to drain out. The ash-hoppers formerly used for this purpose are

yet standing alongside of some outhouses on many farms, but seldom used now.

For toilet purposes a soap made with a vegetable oil is to be preferred—castile, palm, or cocoa—rather than those highly perfumed, but which are sometimes made from the most impure materials. If perfumed soap is wanted the common soap above can be melted, and perfume of any desired kind can be added; but it will be rather strong for delicate skins, and castile is much to be preferred.

Soap-making need no longer be dreaded by the women to whose lot it falls, as, by the methods we have given, as well as other similar ones, all the soap needed in a family for six months can be easily made in a single day.

It is sometimes said that home-made soap costs more than it could be bought for. Perhaps it does, but then you have the satisfaction of knowing from what it is made.

A SUBSTITUTE FOR BLACKBOARDS.—For use in technical and other schools, Prof. Marx, of Stuttgart, recommends black paper and chalk. He orders from a paper-hanging manufactory a long strip of black paper one meter broad, and cuts off a portion as required. The piece is then attached to the wall, and the writing or drawing produced on it with white or colored chalk. The chalk is fixed on the paper by means of a spray-producing apparatus. With this a dilute solution of shellac is blown for a quarter of an hour against the chalk, which then apparently vanishes, but reappears after drying. The liquid is prepared by solution of 50 grammes bleached shellac in one liter ordinary alcohol. The paper, when dry, can be rolled up without the chalk being obliterated. For ten years Prof. Marx has used tables and drawings prepared thus; they generally stand rolled up in a corner, and when they have to be used they are opened and fixed with pins on the wall.

ADULTERATION OF COTTON GOODS.—The *Poly. Zeitung* complains of the adulteration of shirtings and other cotton goods sent from England. It appears that the raw material is given to the weavers to weave into fabrics which are to have the same aggregate weight as the raw material supplied. These weavers greatly augment their earnings by being able to add from 15% to 45% to its original weight by means of the finishing stuffs employed. This adulteration is easily detected by soaking the fabric in water, which dissolves the finishing stuff. The Chinese first discovered the imposition, and will now only purchase washed fabric, i. e., according to "gewaschenes gewicht." The American and German shirtings are quoted as losing from 5% to 10%, and are therefore much preferred to the English material.

KEROSENE LAMPS.—A merchant returned home about two o'clock at night and found his wife lying on the bed groaning heavily and unconscious. She was waiting his return and at last, tired out, laid herself on the bed, after turning down the wick of a lighted kerosene lamp as low as possible without extinguishing it. In this position of the wick, if the oil is bad, a vapor mixed with an innumerable quantity of specks of soot diffuses itself through the apartment, and so covers the eyes, nose and respiratory organs, that on falling asleep one runs a risk of suffocation. It is always advisable, therefore, in the use of kerosene lamps, to allow the wick to burn brightly or to extinguish it entirely.—*Wiener Medicinische Presse.*

GOOD HEALTH.

Sprains.

Hall's Journal of Health gives a chapter on sprains, which may contain useful hints to sufferers from them: Sprains or strains of the joints are very painful, and more tedious of recovery than a broken bone. What we call flesh is muscle; every muscle tapers down to a kind of string, which we call cord or sinew. The muscle is above the joint, and the sinewy part is below it, or vice versa, and the action is much like that of a string over a pulley. When the ankle, for example, is "sprained," the cord, tendon, or ligament (all mean the same thing) if torn in parts or whole, either in its body, or from its attachment to the bone, and inflammation—that is a rush of blood to the spot—takes place as instantly as in case of a cut on the finger. Why? For two reasons. Some blood vessels are ruptured, and very naturally pour out their contents; and second, by an infallible physiological law, an additional supply of blood is sent to the part, to repair the damages, to glue, to make grow together, the torn parts. From this double supply of blood, the parts are overflowed, as it were, and push out, causing what we call "swelling"—an accumulation of dead blood, so to speak. But dead blood cannot repair an injury. Two things, then, are to be done: to get rid of it, and to allow the parts to grow together. But if the finger be cut, it will never heal as long as the wound is pressed apart every half hour, nor will a torn tendon grow together if it is stretched upon by the ceaseless movement of a joint, therefore, the first and indispensable step, in every case of sprain, is perfect quietude of the part; a single bend of the joint will retard what Nature has been hours in mending. It is in this way that persons with sprained ankles are many months in getting well. In

cases of sprain, then, children who cannot be kept still should be kept in bed, and so with many grown persons.

The "swelling" can be got rid of in several ways; by bandage, which in all cases of sprain should be applied by a skillful physician—otherwise mortification and loss of limb may result. A bandage thus applied keeps the joint still, keeps an excess of blood from coming to the part, and by its pressure causes an absorption of extra blood or other extraneous matter.

Another mode of getting rid of the swelling is, to let cold water run on the part injured for hours.

Health and Marriage.

The Sanitarian takes strong ground that marriage, at the proper time, is favorable to health and long life. By the statistics of M. Bertelon and others, in a discussion of the subject before the French Academy of Medicine in 1871, from 25 to 30 years of age married men die at the rate of 6; the unmarried 10; and widowers at 22 per 1,000 annually. From 30 to 35 years, the deaths among the same classes respectively are 7, 11 and 19; from 35 to 40, 7, 13 and 17; per 1,000, and the same favorable conditions to the married continue at greater ages. But married men aged from 18 to 20 die as fast as men from 65 to 70.

Among women marriage is not quite so favorable as among men. From 30 to 35, wives die at the rate of 9 and spinsters 11 per 1,000. Under 25 the mortality of wives is a little greater than among single women. After 40 years of age, the longevity of married women is much greater than that of the unmarried.

The probabilities of life in this connection are—a man at 25 who marries has an expectation of 40 years' married life; if he does not marry, his expectation at that age is only 35. A woman who marries at 25 may expect to live until she is 65; if she remains single, to 56 years of age. Widowers and widows are nearly as badly off as those who do not marry.

NERVOUSNESS AND NERVINES.—Nervousness is one of the prices we have to pay for civilization; the nervous savage is a being unheard of. For this disorder, which is partly of mental and partly of bodily nature, relief is sought in various ways, and among these we may place the employment of narcotics. The temporary relief afforded by these drugs is very apt to lead those who suffer from nervous sensations to put too much trust in and resort too frequently to them. In the long run they prove most destructive to health. Their use has of late become so frequent as to threaten society with a serious evil. It has been boldly contended that chloral is to be found in the work-boxes and baskets of nearly every lady in the west end of the metropolis, "to calm her nerves." No doubt this is an exaggeration, but it is a fact that New York chloral punch had become an institution scarcely a year after the introduction of chloral in medical practice, and now it turns out that Germany—"sober, orderly, paternally-ruled Germany"—has such a thing as morphia disease spreading among its population. The symptoms are not unlike those of opium eating. Experience suggests that persons suffering from this disease should at once be deprived of the drug. Their willfulness and liability to relapse, however, are so great, that it is said that only about 25% have been seen to recover in a large series of cases.—*Cassell's Magazine.*

PAINLESS DEATH.—In a lecture at the Royal Institution, Prof. Tyndall, speaking of the painless death by electricity, remarked that Franklin was twice struck senseless by the shock. He afterward sent the discharge of two large jars through six robust men, who fell to the ground and got up again without knowing what had happened, neither feeling nor hearing the discharge; and Priestly, too, who made many valuable contributions to electricity, received the charge of two jars, but did not find it painful. Prof. Tyndall said that this experience agreed with his own; that in the theater of the Royal Institution, and in the presence of an audience, he once received the discharge of a battery of 15 Leyden jars. Unlike Franklin's six men, he did not fall, but, like them, he felt nothing; he was simply extinguished for a sensible interval. This may be regarded as an experimental proof that people killed by lightning suffer no pain. Now, the measured velocity of electricity is many thousand times greater than the measured velocity of sensation in the nerves. Hence, the electrical concussion reaches the center of life without any possible announcement by eye or ear or sense of feeling. There is abundant evidence that death by a rifle ball traversing the brain is for the same reason entirely without consciousness or pain. A rifle ball, however, is a tortoise compared with the electric flash.

POISON IN RED CARPET.—E. Reichardt shows that the red coloring matter of carpets sometimes contains arsenic. It is well known that green coloring matter often contains arsenic, and now it appears that the red vegetable coloring matter of carpets is often contaminated with the same substance. The material formerly known in commerce as Vienna lac has been found to contain from two per cent. to two and one-half per cent. of arsenious acid.

Coast Railroad Items.

The increase in earnings for March last of the Central Pacific railroad over March, 1876, was \$57,318. The increase for three months of the present year over the earnings for the same time of the previous year was \$121,775.

Mr. Harris, Superintendent of Construction of the Southern Pacific railroad, arrived at the Colorado river with his party on the 6th, and returned soon to the end of the track. The force was divided and graders placed on the Mesa three miles from the river, on Monday. This advance party will enable them to reach the Colorado river by the 20th. The road will stop on reaching the Colorado river until the bridge is completed, which will take about 10 months. The work of construction will then be continued on through Arizona.

The track on the bay shore railroad from Oakland pier has been laid up as far as Point Conchal. There are some 700 or 800 graders employed on the work. The engineer has located the depot, side-tracks, etc., in Martinez and it will not be long before the road will be in operation to that point.

The Winters Advocate says that the rails have been laid and the construction car running half the distance to Madison. The track is graded within three miles of Madison. When the necessary bridging is completed, an extra force will be employed and the road rapidly extended to its terminus at Madison.

In the Third District Court, The People, etc., on the petition of the Commissioners of Transportation, bring suit against the Stockton and Visalia and Stockton and Copperopolis Railroad Company and the California Pacific Railroad Company, to compel an accounting of receipts and expenditures.

A Telluride of Mercury.

We were shown this week by Mr. Kustel a new mineral—a telluride of mercury—discovered by Prof. Genth, who has named it "Coloradoite," from the State in which it is found. There are great many varieties of tellurides found in Colorado, but this is the latest discovery; it came from Boulder county. It resembles somewhat in color "copper-nickel," except that it is a little lighter. It is a very pretty mineral, and is very rich in gold—native—intermixed with the ore.

There is a considerable quantity of the mineral in the locality mentioned, and it is quite rich in quicksilver, being a combination of tellurium and quicksilver. We do not know of any previous discoveries of quicksilver in Colorado, or of its being found there in any other form. This mineral has never been found in this State, where deposits of mercury abound. The ore is full of fine specks of gold, both in the quartz and also in the Coloradoite. It is "free" in both instances. It is somewhat singular that these tellurium combinations have been so rare heretofore, and now they are found in many forms and in considerable quantities in Boulder county, Colorado. Outside of that locality they are very rare. The only localities we know of in California where any tellurides are found are at the Carson Hill or Stanislaus mines in Calaveras county, and one place in Mariposa county. In Nevada tellurium associated with gold has been found at the Jefferson mine, near Belmont.

In Boulder county, Colorado, they find native tellurium, and find it associated with gold, silver, lead and now with mercury. All of these combinations are interesting to the mineralogist from their variety; and to the miner because they are generally very rich. From Carson hill the tellurides themselves contain 24% in gold and 34% in silver. Prof. Genth, of the University of Pennsylvania, is now engaged in making an analysis of this new mineral.

Calaverite, which is found at the Carson hill mines, is also found in Colorado in larger quantities than here. Melonite (from the Melones mine, Carson hill, Calaveras county,) is a nickel telluride and occurs with other tellurium minerals at the mine mentioned. Sylvanite, another telluride of gold, found in Calaveras county, is also found in Hungary. Some very fine specimens of it have lately been found in Colorado.

Pacific Coast Engineering.

It cannot be gainsaid that the Pacific coast has contributed to the world, besides its enormous amounts of gold and silver, a material addition, in several important particulars, to its previous acquirements in the arts of mining and civil engineering and in metallurgy. Gold and silver are the veritable components of that lever with which Archimedes proposed to move the world; with them it does not seem even necessary to have a place to stand upon. To build the Pacific railroad over the lofty and snowy Sierra Nevada was no great matter at all to the practical engineering mind of Californians; yet it is the most meritorious work of the kind that the world has seen.

Hydraulic mining engineering is, to Eastern and European miners, engineers and geologists, an unrealized fact; or if presented to them in tangible heights, distances and quantities, a myth, so far removed from them and their practice and surroundings, that it matters not to them whether it be true or false. That the gravel miners of California are digging away miles of hills to a depth of 200 feet or more and depositing them miles away after having bereft the soil of its precious contents, can be best believed when seen. Gold is there and the mountains must come down if it takes a hundred years to sweep them away to the bedrock. The elements themselves do it and man controls the elements, as is his privilege.

In connection with these gravel mining operations some hydraulic engineering feats have been accomplished by private companies, which would be flattering to a government in some of the older countries of the world. Water has been brought from great distances over a country so mountainous and rugged that such a thing would have been deemed impossible anywhere else; difficulties have been surmounted and obstacles overcome, which, if standing in the way of any other purpose than that of gold mining, would have been considered so serious as to put a stop to the undertaking at its inception. Some of the long bedrock tunnels run in this State to open up supposed deposits of auriferous gravel, are undertakings which, elsewhere, considering the nature of the schemes, would be thought foolhardy enterprises; while among us it is nothing uncommon to see such enterprises commenced when the owners themselves know it will cost thousands of dollars and consume years of time before completion; and even then in some cases the result is only a question.

In quartz mining we have undertaken schemes costing such amounts of money as to astonish people not familiar with the business. Shafts of great depth are sunk and machinery costing hundreds of thousands of dollars are placed upon them. The civil and mining, as well as the mechanical engineers, have been called

upon in this country to exercise their skill to the utmost in their different branches, and to this is due, in a great measure, the boldness of some of the undertakings. Altogether we consider that the engineers of the old world would find many matters in their line which would be a surprise to them on this coast and that they would be compelled to award high praise to the persons carrying out the enterprises which have been successfully completed here.

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective superintendents on file at the offices in this city:

No ore is being taken from the Eureka Consolidated mine.

They struck a fresh body of water in the shaft of the Comanche mine this week.

About 80 feet south of the present end of the 73-foot drift north of the incline of the De Fries, a ledge bearing north 30°, east with a dip of 36° from vertical, intersected the main ledge.

The water in the Savage and Hale & Norcross remains about the same, and although the pumps are kept as steadily at work as possible, they do not get ahead of it much.

Chollar turned out 626 tons of ore last week, of an average value of \$25 per ton.

The northeast drift on the 1450-ft level of the Baltimore Consolidated looks very encouraging.

In the Jefferson they have opened up a fine ledge of quartz on the 700-foot level, carrying about 10 inches of fine ore.

At the Golden Chariot (Idaho) there are 700 tons of high-grade ore at the mine awaiting condition of the road that will admit of transportation to the mill.

The water and heat give unusual trouble in the Overman.

Sinking has been resumed on the C. & C. shaft.

The March product of the Idaho mine, at Grass Valley, was \$42,982. The usual dividend of \$7.50 per share, amounting to \$23,250, was paid.

The last clean-up of the Eureka (G. V.) was 345 ounces of amalgam.

The Empire (G. V.) mine shipped \$16,599 in bullion in March.

The improvements in ventilation have enabled them to make excellent progress in the crosscuts on the 1700-ft level of the Best & Belcher.

As soon as the south drift—1700-ft level—of the Gould and Curry is connected with the Savage joint winze (which will be in about six weeks) it is the intention to commence crosscutting on the south line. These three drifts running east will thoroughly prospect the south two-thirds of the mine, while Best & Belcher cross-cut near north line will determine the chances in that direction.

The March product of the Leeds mine was \$33,000, against \$32,000 in February.

In the Manhattan, for the month of March, 405½ tons were reduced; assay value, \$87,359.83. The different stopes continue to yield about the usual amount of ore.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from prominent mines have been as follows: Comanche, April 3d, \$7,135.36; Northern Belle, 3d, \$9,189.38; Tybo Con., March 31st, \$17,406.86—total to date, \$106,274.36; Empire (Grass Valley)—total for March, \$16,599; Modoc, April 5th, \$9,524—total to date, \$19,475; Northern Belle, 6th, \$9,367.33; Tybo Con., 5th, \$13,435; Grand Prize, 2d, \$5,515; Indian Queen, \$7,483; Modoc, 7th, \$5,053; Con. Virginia, 7th, \$64,764—first shipment for April; California, 7th, \$307,353—first shipment for April; Grand Prize, 7th, \$4,917; Leeds, 6th, \$4,200.

WRECK OF THE "FRANK JONES."—In the window of Heuston & Hastings, on Montgomery street, we noticed this week a water-color painting of the wreck of the ship *Frank Jones*, that broke her hawser and drifted on the rocks near Port Point last week while being towed to sea. The sketch was made on the spot soon after the disaster and shows the vessel amid the rocks with the surf breaking around her. The picture was made by Mr. Joseph S. Bayless, a draftsman in this office, and is spirited and truthful in drawing, and soft and pleasing in color.

ONLY AN ADVERTISEMENT.—Although set in advertising type and columns, a subscriber has taken the advertisement of the "Union Silver Plating Company" as that of the publishers of this paper. We have nothing to do with the "spoon business," but accepted the advertisement at our regular rates believing that no one would be injured. We would say the same of the Western Gun Company's and like advertisements. If anybody doesn't get the worth of their money please report.

IRON AND STEEL.—The board to test iron and steel has suspended its operations, owing to the refusal of Congress to make the necessary appropriation therefor. The testing machine which the board has constructed will be erected at the Watertown (New York) arsenal, and used by the Ordnance Department in testing metal to the extent which the means will allow.

The *Pall Mall Gazette* says: Unless Turkey yields to all or nearly all that Russia demands, there will be war before many days.

Foundry Notes.

Business at the foundries and machine shops continues quite dull, most of the work being limited to small jobs.

At the Golden State iron works they are making a Golden State blower to act as a suction fan for the condensers of the New Idria quicksilver mine. Are also making cast iron pipes to take the place of the worn-out wrought iron pipes in the furnaces at the Oceanic mine.

At the Wilcox pump works they are making new and improved patterns of mining pumps for very heavy work, which we shall shortly describe in detail. They are just setting up at the Redwood City water works a pump to supply 20,000 gallons of water per hour. It will be in operation in about ten days.

Joshua Hendy is quite busy making "\$1,000 Challenge ore feeders." He is just now making two dozen of them. Four of these feeders are being shipped now to the Black Hills, and several have been put in the Briggs Brothers' mill, at Black Hawk, Colorado. Two were recently shipped to the Black Warrior mill, in Arizona, and two are being built for a new mill near the McCracken lode, Arizona. Four are being shipped to Bodie, district. Two were shipped recently to the Eclipse mine, Inyo county, and Mr. Hendy expects to send six more there soon. All of those in use are very strongly recommended, and the fact that so many are being made speaks well in their favor.

We noticed in the alley-way running between the Aetna and Fulton iron works back to Hawkins & Cantrell's shop, a form of drilling machine which is just being introduced to the notice of the mining community. The drill is light and is set in a light wrought iron frame, which is capable of being arranged so as to point the drill in any desired direction. Motion is imparted to the drill by hand power, a crank and fly wheel being placed on each side. On the crank shaft are two cams which, as it is revolved, raise up the drill-stem and at the same time compress two powerful coiled springs. As the cam passes the springs force the drill down with a quick, strong blow. A lug on the shoulder of the cam serves to rotate the drill so that the drill point has the best cutting effect. The drill points are peculiar in shape and it is claimed that they do very effective work. Two men can operate the machine with ease and do much quicker work than by hand. It can be seen at work on rock in the place designated above. We shall probably give a more extended notice of this device on another occasion.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

IMPROVEMENT IN CLOTHING.—Adolph Pack-scher, S. F. This invention consists in inserting in the waistbands of pants, drawers and vests, and in the lower part of the legs of men's drawers, one or more gores of elastic material, either permanent or temporary, so that the bands of said articles of clothing will be elastic and provide a better and easier fit than the ordinary strap fastenings and buckles. The elastic gores can either be sewed permanently in place or they can be inserted so that they can be removed in case it should be desired to do so before the article of clothing is washed. This arrangement does away with the usual straps and buckles used to tighten the waistband, and the strings and buttons used on the bottoms of drawer legs.

CIGAR HOLDER.—F. H. W. Von Tiedemann, S. F. This is a novel device for holding cigars while they are being smoked, and which may also be converted into a pipe if desired. The device consists of a tube with a mouthpiece and a perforated tube adapted to be thrust into the side of the cigar, together with a steadying arrangement to embrace the end of the cigar and steady it. A chamber is formed in the removable head so as to receive and retain any moisture which results from smoking. The device can easily be converted into a pipe.

IMPROVED SAW SET.—A. Boisset, S. F. This invention is a novel saw-setting device, which is especially adapted for setting band saws, although it can be used for setting other kinds of saws if desired. The device will set narrow blades with great speed and regularity.

The gunboat *Rocket* has returned to Victoria from her voyage of inquiry into the *G. S. Wright* mystery, bringing four Kumquilt prisoners, who were lodged in jail. Two of the prisoners are charged with scuttling a trading schooner and murdering two of the men some time ago. The others are charged with complicity in killing some of the *Wright* people, who are supposed to have reached the shore from the wreck. It is said that the cash-box of Major Walker, United States Paymaster, who was lost with the *Wright*, is in possession of the Kumquits. A piece of one of the vessel's masts was discovered.

The report of the Minister of Mines of British Columbia shows that since 1858 there has been exported from the province \$39,984,000 in gold, the product of the provincial mines. The coal and lumber interests show great expansion during the past year.

First Settlement and Early History of the "Eastern Slope"—No. 3.

Sharp Practice by the Mormon Rulers.

The dissensions between the outsiders and the Saints continuing to increase, the head men of the church, with a view to harass their opponents and discourage further immigration into the country, proceeded to dismember Carson county, issuing an order at the same time that all the public records pertaining thereto should be removed to Salt Lake, more than 600 miles away. By the adoption of these measures it was hoped that these troublesome interlopers from California, being without the means to legally secure possession to any portion of the public lands, and shut out from all chance of participating in the management of affairs, would become disheartened and withdraw from the country.

Under the statutes of Utah no one could gain possessory title to any part of the public domain without having the tract he sought to occupy surveyed by the County Surveyor and afterwards duly recorded, the whole to be fenced within one year thereafter. If, now, there were no Surveyor to do this work and no officer to make a record of it, then, reasoned these Salt Lake dignitaries, the Gentiles, being unable to gain legal possession of the land they coveted, would refrain from making any settlements, the Saints having already secured in the proper manner all they wanted.

Not only this, but the entire machinery of the law being removed, no debt could be collected or other act of justice enforced; no record of any kind could be made or paper officially filed; not even an oath could be administered, the whole community being left without any security for person or property. To this condition were the inhabitants of Western Utah reduced by the action of these perverse and crafty rulers at Salt Lake.

Movement of the Seceders—A Delegate Sent to Washington.

Being thus virtually without any local government the disaffected portion of the people began at last to move actively in the matter of erecting this section of Utah into a separate Territory, certain measures looking to that end having been taken the year before. Judge James M. Crane, a well known California journalist, who had removed to this region in 1857, had that year been chosen by the Gentile portion of the population to visit Washington and lay the condition of affairs before Congress and ask for the enactment of a law effecting the desired severance from Mormonism. Crane executed his mission intelligently and faithfully but without accomplishing its object; wherefore his constituents, despairing of relief from that quarter, determined that they would sever their political connection with Utah and form for themselves a sort of

Provisional Government.

Trusting the chances of its being afterwards recognized by Congress; for which course of procedure they found partial warrant in the case of Oregon, where in 1843 recourse was had to this make-shift style of government with the subsequent approval of that body.

In accordance with this programme a mass meeting was called on the 6th day of June, 1859, at Carson City, whereat it was resolved that a convention of delegates, to be chosen by the people in all parts of western Utah, should be held at Genoa on the 18th of the following month, for the purpose of conferring together on the evil state of affairs and the adoption of some plan for correcting them.

They Frame a Constitution.

As this call had failed to point out definitely what the people desired should be done, the convention was much divided on this point when they came together, the major part of the members being of the opinion that it was intended they should frame a constitution prescribing the rights and duties of the people under a Territorial form of government, having preceded that instrument by a declaration setting forth their reasons for desiring a political separation from Utah Territory, the whole to be submitted to the people for their consideration: A minority of the members took, on the other hand, the view that they had been chosen to merely provide for the calling and proper construction of a constitutional convention, the members of which were to be afterwards elected by the people.

It Is Adopted.

The view taken by the majority prevailing, a constitution, modeled very closely after that of California, was drafted, and, having been submitted to the people on the 7th day of September, 1859, was adopted by a large majority of the votes cast; the vote being, however, a light one for the number of people that had by this time arrived in the country, the advance guard of the silver-seekers having already put in an appearance. Of the old settlers some voted against the adoption of the new constitution, while others absented themselves from the polls altogether, both of these classes believing the movement premature and some of them looking upon it as revolutionary and unlawful.

They go for Much Territory.

In fixing the boundaries of the new Territory, which they had designated Nevada, a liberal slice had been taken from California, and a considerable chunk from Arizona—a provision that alone would have led to the rejection of this constitution, had it ever been submitted to Congress for their approval. The appropriation by these sagebrushers of our constitution was all

well enough, but this attempt at filching some fifteen or twenty thousand acres of our territory was a thing not likely to be tolerated.

A List of their Grievances.

In the declaration mentioned these representatives of the Gentile population of Western Utah set forth, among other wrongs by them suffered at the hands of the Mormons, the following, viz: That the latter have grossly and in many ways violated the organic act creating the Territory of Utah; that they have shown themselves opposed to the government and institutions of the United States, and declared war against the same; that they have refused to submit to the laws of the country, while claiming their protection; that they have so legisla-

events. Nevertheless, the success of the independent movement was destined to be postponed yet a couple of years longer, the stirring events incident to the great mineral discovery having so absorbed the attention of both Gentile and Saint that little heed was for some time after given to questions of either political, social or legal significance. A few of the more ardent seceders, however, in the hope that they might be able to keep the new government they had helped to set up still on its legs, or rather, perhaps, not willing to seem indifferent to the cause they had so heartily espoused, attended the election fixed to come off in the fall and chose a governor and members of the Legislature, as provided for in the new constitution.

SECTIONAL VIEW OF STREAM CONCENTRATOR.

ted as to favor their own people and discriminate against outsiders, protecting criminals and violators of the law when they were Mormons; that they have conferred such powers upon local officers as to neutralize the authority of the United States Marshals; and, by selecting juries wholly from among the adherents of the church, render the laws of Congress practically of no effect, enacting, at the same time, laws in defiance thereof; that they have robbed and murdered our citizens while crossing the conti-

Isaac Roop having been elected to the office of Chief Executive. On December 15th, 1859, this body met at Genoa, and having received the first annual message of the Governor, proceeded to pass sundry resolutions, and having appointed a committee to draft a memorial to Congress asking recognition of the new provisional government, found their labors at an end, the Governor having sent them a message, which, after vindicating the action thus far taken, proceeded to recount the altered circum-

PLAN THROUGH A TO B.

ment, and incited the Indians to hostilities against them. Against these and other outrages and wrongs equally atrocious the complainants have sought protection and redress, sometimes applying to California for assistance, and again invoking Congress for a separate Territorial government, but all in vain; wherefore, smarting under a sense of neglect and wrong, they have felt impelled to now declare their entire and unconditional separation from Eastern Utah, and to adopt for themselves a constitution and Territorial government, which they confidently expect will meet with public approval and Congressional recognition.

The New Government Stands Feebly on its Pins and the Discovery of the Comstock Lode Knocks the Breath Incontinently Out of it.

That the charges here preferred against the Mormons were not without foundation we have good reason to suppose, some of them having been fully and fearfully verified by subsequent

stances under which they now found themselves, adjourned the legislature until the first Monday in January, it being understood that this adjournment would be final, as proved to be the case.

Judge Crane, who at the June election had again been chosen delegate to Congress, having died suddenly when on eve of taking his departure for Washington, John J. Musser was elected to fill his place. Proceeding to Washington Musser urged upon Congress the necessity of some measures being adopted for the relief of his constituents, without being able to effect anything definite.

Cut Loose at Last.

Meantime, John Cradlebaugh, who had been appointed one of the United States District Judges for Utah, arrived at Carson City, having been assigned to this district. Early in the summer of 1860 he proceeded to open his Court, appointing the few officers warranted by

his judicial functions. As the statutes of Utah were still in force, compelling the Court in all things to conform to their requirements, not much civil business was done. Still, the people, beginning to feel the need of some sort of organization whereby the more simple processes of business, such as acquiring, holding and transferring property, might be performed, determined upon the rehabilitation of Carson county, to which end an election was held in the month of August, and a full set of officers chosen. Nevertheless, things failed to work smoothly and almost everybody having misgivings as the legality of what was done, great was the satisfaction felt by all when the bill providing for the organization of Nevada Territory received the Executive approval on the 2nd day of March, 1861.

Mechanical Ore Concentration and Separation—No. 29

[Written for the PRESS by FRANCIS M. F. CAZIN, M. E., Santa Fe, New Mexico.]

Stream Concentrators.

The description of important contrivances for separation of fine-sized material would not be complete without proper attention being given to the stream concentrator, of one of the most perfect forms of which we give a design.

This apparatus has a capacity of 500 pounds per hour, and requires no other motive power than from six to twelve cubic feet of water per minute. The pulp is fed from above and the clean water through the pipes at the bottom, with a pressure sufficient for an overflow in the middle. The concentrated heavy material escapes through the funnel at the bottom, and the light waste material overflows from the central rim into the circumferential gutter, and thence escapes by an outlet. Previous explanation of its principles makes the action intelligible without further specification.

X. General Shape of Mineral Dressing Works; Their Cost of Construction and Operation.

To establish a standard shape for mineral dressing works would be an attempt productive of damage and failure. The nature of the ore, the quantity to be treated, the locality of the mine and water, the climate of the country, the building material to be used, are so many items influencing the proper selection of arrangement and shape, and not only do mistakes with regard to any of these points influence the efficacy of the works, but also the running cost of their operation, and it is always well in such construction to consult an experienced engineer and have all the plans drawn up by him before moving a piece of timber or a rock. Good plans accompanied by good specifications usually enable the mine owner to realize the adaptability of such plans for his special case and to judge of his ability to complete the works as planned. It will not do to build in part and to leave part unconstructed, as the works must form an entire system, with proportionate equal capacity of all the parts, or they will occasion unnecessary cost in construction and will do costly work.

It is not advisable to construct works of a smaller capacity than one ton per hour, and such an establishment will on the Western slope cost from \$16,000 to \$24,000, freight added from railroad terminus. For works of greater capacity the cost of construction does not increase in arithmetical proportion, as a capacity of four tons per hour can be attained for an outlay of only double the amount for one ton per hour. These are figures based on experiment and represent the actual cost.

For treating ore in mineral dressing works in this country the cost varies largely, and is influenced not only by the price of labor and motive power, but largely by the shape of the works. Works situated on the slope of a hill, near the water, where re-elevation of material is dispensed with entirely or nearly so, do their work most cheaply. The author constructed and run such works for three successive years at a running expense of only 80 cents per ton treated.

Works constructed so as to receive the ore direct from the mine pit, prolonged above ground so as to deliver the ore at an elevation sufficient to avoid re-elevation of the ore, are also worked at small expense. Where the ore is delivered on the ground floor, and where the building is of such limited height as to render frequent re-elevation of the material necessary, the expense of running is higher. Re-elevation of dry ore is comparatively a simple matter, but to re-elevate ore pulp and water therewith has always proved a difficult task for cup elevators as well as for mud pumps, and the contrivance as yet best adapted for the purpose is Hall's pulsometer—if the balls and ball sites are made interchangeable and of a material resisting the friction. Nevertheless, where re-elevation can be avoided, the running will not be subject to interruption, and at lower average expense, which under unfavorable circumstances will augment to three, four and five times the amount stated above.

One of the important points in arranging the respective location of machinery is the proper incline of gutters and spouts for conveying the ore. Seven degrees from horizontal will carry ore submerged in water, but for dry grains and coarse sands 42° are the least admissible, and for fine sands and dust 45° are not always sufficient, but 60° will carry them. The proper selection of these angles is of such great importance that a single mistake will necessitate reconstruction or occasion irregularity of run and consequent greater running cost.

A Great Mining Enterprise.

The Chollar-Norcross-Savage Shaft Company.

The Comstock lode, as is well known, says the *Gold Hill News*, has a regular dip or inclination of about 45° to the eastward. The first prospecting and ore extraction was begun on the croppings of the ledge at the surface, and has extended downward with the inclination of the vein to a perpendicular depth of 2,400 feet. As the dip and inclination of the fissure was determined, the machinery, buildings and surface works of the several mining companies were gradually removed to the eastward and new shafts sunk. Those of the Gould & Curry, Savage, Hale & Norcross and Chollar-Potosi mines were located nearly on a north and south line with each other, at a distance of about 1,000 feet east of the outcroppings of the ledge. These shafts were sunk perpendicularly until the foot or west wall of the vein was encountered, and then inclined with the course or dip of the lode. This inclination soon carried the operations of the miners on the lower levels several hundred feet to the eastward of the works on the surface. To apply the ordinary character of machinery to the prosecution of the work in that way, placed it at a great disadvantage, and required nearly if not quite double the power necessary in a direct prosecution of the work through a perpendicular shaft. In addition to this it added immensely to the cost.

Two years and a half ago the Chollar-Potosi, Hale & Norcross and Savage mining companies entered into a combination to sink a perpendicular shaft for the purpose of prospecting the lode at depths hitherto deemed impossible. This enterprise assumed the name of the Chollar-Norcross-Savage shaft company. In this company the Chollar-Potosi hold an interest of 1,400 shares, the Hale & Norcross 400 and Savage 800 shares. To superintend the construction of these great works and the prosecution of the shaft, Isaac L. Regua, for many years Superintendent of the Chollar-Potosi mine, was selected. The site chosen was on a steep hillside to the eastward of Virginia City, 300 feet south of the line of the Sutro tunnel, and about 3,300 feet east of the croppings of the Chollar and Hale & Norcross mines. The first step taken was to construct a side-track from the Virginia & Truckee railroad to the site selected. This track is 2,276 feet in length, and being built along a steep hillside, with many deep cuts and fills, was, considering its length, a very expensive undertaking. The foundations for the machinery and buildings were blasted out of the bedrock. The steepness of the hillside permitted the erection of the main building 50 feet above the mouth of the shaft on a plane leveled for the purpose. This places the hoisting and pumping machinery all on a level with the sheaves of the hoisting frame, and entirely hides the mouth of the shaft from the engineers.

The main building is 60x100 feet in size, the wall 20 feet in height, and is roomy and commodious in every respect. The shaft-house, extending west of and adjoining the main building, is 40x60 feet, with walls 50 feet in height. The blacksmith and machine shop is 40x60 feet, with 20-foot walls. The boiler-room on the north is 40x50, with 25-foot walls. The carpenter shop is 100x50 feet in size, with walls 18 feet high. These measurements will serve to explain and show the huge preparations being made for the carrying on of the great undertaking. The pumping engine is one of the most powerful of the kind ever constructed. It is a compound, condensing, direct-acting beam engine, with a 32-inch initial cylinder, 10-foot stroke, and a 65-inch expansion cylinder, and 8-foot stroke; capable, under an ordinary pressure of steam, of exerting a force of 700-horse power. The motion is controlled by the Davy differential valve gear. A double line of 12-inch pumps are to be placed in the shaft. The lift pumps in the shaft will be 200 feet apart. Both lines of pumps can easily be run at a fair rate of speed on an 8-foot stroke. The pump rods are of the best Oregon pine, are 15 inches square, and are each 100 feet in length, strapped together with the toughest and best of iron. The water when brought to the surface will be conducted to a huge reservoir erected several hundred feet from the works, where it will cool and settle, and then be returned to the works for condensing purposes. This engine and pumping machinery was manufactured by Prescott, Scott & Co., of the Union Iron Works, San Francisco.

The hoisting engine has a 20-inch cylinder, 36-inch stroke, and is capable of sinking the shaft to a depth of 2,000 feet. The machinery is so arranged that another hoisting engine of the same power can be added whenever it is needed. The hoisting sheaves, which are on a level with the engine, are 20 feet in diameter, and rest on the solid bedrock at a height of 50 feet above the mouth of the shaft. Each sheave is lined with wood to prevent and save the usual friction and wear of the steel cables. Placed at a convenient distance from the pump shaft is a huge geared steam winch, capable of handling with ease a weight of 40 tons. This winch is to be used in hoisting, lowering, and placing the pumps and columns in the shaft. The cables for hoisting in the shaft are of the best steel wire, six inches wide by half an inch thick and 2,800 feet long. The cable for use in the pump shaft is of the same material, seven inches wide and three-fourths of an inch thick. The boilers for supplying the steam are four in number, in sets of two each, are 16 feet in length and 54 inches in diameter. Ample room

and foundations for the insertion of double the number when needed has been provided. The hoisting machinery was manufactured by Moore & Co., of the Risdon Iron Works of San Francisco. The entire machinery in the carpenter, machine, and blacksmith shops is run by attachments to the hoisting engines, thus making a great saving of cost and labor.

The shaft has four compartments, three of which are five by six feet in the clear for the hoisting, and one six by seven feet in the clear for pumps. To construct this shaft and make room for the necessary timbers, an excavation 10 feet in width by 30 feet in length is required. It is timbered from the surface downward with 14-inch square spruce pine timbers; experience having demonstrated that to be the best timber for such work. The most efficient arrangement of all, however, is that for hoisting rock or ore. It is an original invention, gotten up by the Superintendent of the works, and is something different in its mode of operation from any other hoisting rig in any portion of the old or new world. It is called a "skeet," and takes the place of an ordinary cage and cars for all hoisting or lowering purposes. It is simply a strong square box, tapering from the top down, manufactured of the best of heavy boiler iron, is water-tight and is capable of holding four and one-half tons, or eight ordinary car-loads of rock or ore at a trip. This box is suspended in an iron frame or sash, with the usual gibbs and safety attachments. The box is pivoted at the bottom of the sash, and when hoisted to the surface, is, by a suitable device, turned bottom up and its contents dumped without any touch or aid of man. When emptied it rights itself and is firmly secured by a simple contrivance in its place and is ready to descend. It is equally available in hoisting rocks or water, and in hoisting and lowering men.

The weight of one of these hoisting tanks does not differ much from that of a cage and empty car. The cables are so arranged that one of the tanks descends while the other ascends, making a perfect balance of weight, when empty. Tests have been made which prove that with this arrangement 2,400 tons of rock can be hoisted from a depth of 2,000 feet with ease every 24 hours.

It is, beyond a doubt, the most economical and labor-saving device of that character yet introduced on the Comstock. It does entirely away with the services of from eight to 12 men usually employed around a shaft. The dump, into which the skeet empties, has a drain at the bottom to carry off the water; will hold 40 tons of rock, and can be emptied from either side as fast as it is filled.

Ground was broken for the commencement of the side railroad track on the 9th day of January, 1875; sinking the shaft commenced on the 1st day of June of the same year. It is now down a little over 1,200 feet, and is calculated to strike the Comstock ledge at a depth of 3,500 feet. The first 800 feet of the shaft was sunk with a large steam winch. Fifty-three days' time was lost while putting the hoisting engine in place of the winch and in making necessary changes of machinery. This would give an average rate of 65 feet per month, without allowing for any of the ordinary delays in sinking; which, considering the immense size of the shaft, and the heavy timbers, which in all soft ground encountered are placed only four feet apart, is unprecedented in even the fast mining operations of the Comstock. About 50 men are employed at the works, and an average of three cords of wood is consumed every 24 hours. So far no use has been found for the pumps whatever. A light flow of water was struck while sinking, which was caught up in tanks and is hoisted to the surface in the skeet. This flow averages about 20,000 gallons of water daily. The shaft is now within 450 feet of the Sutro tunnel level, and will reach that depth long before the tunnel is likely to reach the ledge. This shaft is calculated to prospect the lode to a depth of 4,000 feet or 2,300 feet below the level of the Sutro tunnel, and is beyond question one of the mightiest mining enterprises ever undertaken in any part of the world.

Leeds District.

A Few Words of Caution.

A correspondent of the *Salt Lake Tribune* writes the following sensible letter: Having noticed several letters in your paper from this place giving wonderful accounts of its richness, and although I think with the writers it is one of the most promising camps in Utah, still I think that correspondents writing from a new place like this cannot be too careful in their description of its prosperity, for fear of inducing poor men to do what they may be very sorry for afterwards. I have seen the rise and fall of a good many mining camps to the discomfiture of hundreds who had been deceived by letters which they had read in the newspapers. Unfortunately there are thousands of working men on this coast who are too ready to leave fair wages and start off many weary miles on foot for some new El Dorado which they know nothing about, and find too late that they had better have stayed where they were.

A Puzzle.

Now, this camp is a puzzle to the wisest. There never has been silver found in such a formation before in this country, although I believe there is something similar in Mexico. There seems to be a great quantity of the precious metal here, but as to the permanence of the mines no one knows. Some small and very rich veins have been found near the surface, and

samples of ore sent from here have created some excitement abroad and been the means of men coming here, to their sorrow. Many come, expecting to locate a mine, and find that every foot of ground that is worth building a monument on has already been taken up, and most of it by two or three different parties, who are at loggerheads as to who has the best right. Then their only chance is to try for work, which they seldom find. There are more men here than can find employment at present.

What the Camp Needs

Is capital. We want to see some one with money and courage enough to put up a custom mill and give the poor fellows a chance to find out whether they have got a mine or not.

There is less money in sight here just now than in any other town of the same size in Utah. Those who have good claims can do nothing with them, for it costs \$30 per ton to send the ore to Pioche, besides the cost of milling, and the ore being taken out now will not average \$50 per ton. Some of the claims are looking well, and we hear of several sales being made to San Francisco parties. And we hear of two mills on the road to Leeds; but even allowing the mills to be a fixed fact, it will be at least three months before they are grinding the silver out of the sand.

The Town of Silver City

Is growing rapidly—perhaps a little overdone. We have plenty of stores, saloons, restaurants, etc., but there is so little of the circulating medium that most all business is done on jaw-bone, and it is really beautiful to see the confidence that folks have in the people.

I don't want to discourage any man who has made up his mind to come here, but I think he ought to know before he leaves home that the streets of Leeds are not paved with silver, nor the houses papered with greenbacks; and that after arriving here, if he should not get work, he has the deserts of Arizona before him, or else the road back to where he came from. To a man with money enough to prospect with, this country offers some inducements, but to a man without means to keep himself for a month or two, it offers little just at present. Any one content to live on climate and expectations can fatten here, for our climate is beautiful and our expectations enormous. In a few months there may be some more substantial diet, that is if the Gentile prayer availeth anything.

Life at the Smelting Furnaces.

The working hours at smelting furnaces, says the *Eureka Sentinel*, are divided into the same periods as at the mines—eight hours—and they change their hours every two weeks. Each furnace employs a force of 15 men (exclusive of ore and charcoal men), of whom there are three smelters, six feeders and six slag-wheelers. The wheelers are employed on the second or feeding floor of the works; their labor consists of charging the furnaces with the requisite amount of coal and ore through the feed holes of the shaft. It requires no special training to do the work, but the men are exposed to the ascending fumes, and it is generally looked upon as the most unhealthy part of the work. The slag-wheelers are kept busy hauling away the melted debris, iron and bullion, and assisting the smelter whenever occasion may require. The work is very laborious, and eight hours is sufficient to exhaust the physical powers of the strongest men. The smelters' duty lies entirely in front of the furnace, and it is to his care and attention that its success is due. Green men will not answer for this part of the work and their ranks are recruited from the slag wheelers, whose ambition leads them to aspire to the position. Their work consists of watching and assisting the flow of slag that floats on the surface of the metals, which consists of liquid silica, limestone and the impurities of the ore, tapping and drawing off the iron when it accumulates to a certain height in the crucible, ladling out the base bullion from the lead well into molds, regulating the blast and testing the iron and slag to see that no lead is escaping from the spouts. One hour after commencing their work the blast is shut off and the whole force congregate in front of the furnace preparatory to "barring out." This, however, is only the rule in the shaft furnace, the hydrocicles dispensing with this operation. It is a vexed question as to whether anything is gained in the water-jackets by this improvement, but we will not discuss the arguments pro or con. There is no doubt that, in the shaft furnace, the operation more than compensates for the time lost in performing it. We have described the work at some length before, and will not now attempt a description of it in detail. It consists in removing the chilled slag and iron that has cooled outside the hearth, breaking down the old and putting in a new clay front, and stirring up the inside so that it is loose and free from horses, thus facilitating the smelting of the ore. It generally consumes from a half to three-quarters of an hour, and on its completion the blast is turned on and the work proceeds without interruption during the remainder of the shift. The work varies in laboriousness, and depends greatly on the quality of the ore. Ores with a large percentage of lead, as a matter of course, form greater quantities of bullion, while other ores will run to slag and iron. The greater the quantity of slag, the more work for the wheelers and feeders, and vice versa. The wages received are fair, the smelters getting five and the others four dollars per day for their services. Notwithstanding the prevailing impression that the work is very unhealthy, there are always a

surplus of applicants for vacancies, and no trouble is experienced in procuring help. Some men are more susceptible to the influence of the fumes, and soon succumb to its poisonous effects, while others work around the furnaces for years without experiencing any deleterious symptoms. It is noticeable that the men who pay the most attention to cleanliness and dissipate the least are those who escape. There have been great improvements made in the way of ventilation, and this has caused a marked decrease of the unhealthiness of the work. As a class the men employed are intelligent and industrious, and there are many who have followed the occupation ever since smelting was inaugurated in Eureka.

MARBLE QUARRY.—It may not be generally known that inexhaustible quantities of marble exist in Amador county. Messrs. Tubbs & Co., of San Francisco, are now working a quarry about two and a half miles beyond Plymouth, toward Fiddletown. Four or five men are employed in breaking the stone. The engine lately used for hoisting purposes at the Volunteer mine has been removed to this quarry. Last year 20 car-loads were shipped in the course of three months, but this season a much larger quantity will be sent away. The marble cannot be said to be of a first-class quality. It is of a grayish color, with dark streaks running through it. Although not capable of a very high degree of polish, it is nevertheless found useful for a variety of purposes. For bases of monuments, coping, window sills and similar uses, it is extensively used. There is a steadily increasing demand for the article; indeed, at present, the demand far exceeds the facilities for quarrying. Up to this time the shipments have been confined almost exclusively to Oakland, for bases for monuments and tombstones. The proprietors of the Stockton Marble Works are also sending their orders. With proper attention this branch of industry may be greatly extended.—*Amador Ledger*.

DEWEY & CO'S
SCIENTIFIC PRESS
Patent Agency.

Publishers, Patent Agents and Engraver,
224 SANSOME STREET, SAN FRANCISCO.

We carry the N. Y. watch, and you can refer to the publishers of this paper as to the superiority of the N. Y. Watch Company's movements, manufactured at Springfield, Mass. Also to any one else who owns one.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us against the acts and mistakes of others.

Dewey & Jordan have been at 433 Montgomery street, S. F., for 13 years. They are reliable—like the "New York watches" they sell.

WOODLAND, CAL., Aug. 8th, 1876.
Messrs. DEWEY & Co.—Gents: Your letter containing the patent for my Centennial churn has come duly to hand, and you will please accept my many thanks for the prompt manner in which you attended to the business entrusted to your care, and I will take great pleasure in recommending you to any one having anything to attend to in your line. I am having a number of the churns put up, which will be ready for sale in a few weeks.
Yours truly,
JAMES ROOT.

Continued from page 229.

ing the Scorpion, which is an extension of the Falcon. We shall have good reports from Rock Creek before the summer is over.

TUSCARORA DISTRICT.

THE MINES.—Tuscarora Times, April 3: The Tuscarora Consolidated company are sinking. They have about 50 tons of good ore on the dump. Parker & Smith have struck it rich in the Maryland. Edwards & Co., owners of the Diana, are sinking on their ledge. The Ventura company are running a tunnel to tap the ledge. They are in about 70 feet. The Silver Vault mine has a 60-foot perpendicular shaft and a 75-foot incline on the ledge in good ore. The First Eastern extension of the Grand Prize is improving every day—taking out rock in which horn silver can plainly be seen. They have commenced sinking a new shaft on the Navajo ledge. In the bottom of the shaft they have a four-foot ledge of very rich horn silver ore. The Western extension of the Grand Prize has a perpendicular shaft 90 feet deep. A drift has been run from the bottom of the shaft a distance of 30 feet in a northerly direction, cutting through the ledge, which looks well.

Arizona.

GLOBE DISTRICT.—Arizona Enterprise, March 31: The Richmond vein outcrops 2,000 feet. The gangue is porphyry in a formation of gneiss and syenite. There are two shafts sunk upon the mine, one of which is down 20 feet and the other 35 feet, both of the shafts showing good walls and having rich ore at the bottom. We asked Mr. Hubbard about the silver placers belonging to Chilson & Co. He says that the placers are in Richmond Basin, and that they are the overflow of the Richmond vein. The silver, in the form of horn silver and copper silver glance, is found lying on the bedrock. Mr. Hubbard has a better opinion of Globe district than of Pioneer district, in which the celebrated Silver King mine is situated. He says, however, that there is a force of 41 men at work in the mine and 19 on the dump at Silver King, and that there is \$400,000 worth of ore in sight.

In the Peck district, on the Peck mine, the shaft is down 300 feet. There is a tunnel run north along the vein, striking the main shaft at a distance of 250 feet, at a depth of 233 feet, thence north 350 feet, making the tunnel 600 feet long. Another tunnel is run below from the north and run south, being in 100 feet. The lower level is 45 feet below the south tunnel, and runs 120 feet north and 20 feet south of the main shaft. This level is connected with the tunnel from the south by winzes Nos. 1 and 2, which are sunk to a depth of 45 feet. The hanging wall of the Peck is quartzite and the foot-wall slate. The ore gives, by milling process, an average of between \$500 and \$600 per ton, and is free milling ore. The ore is assayed at the mine, sacked and carried on pack-animals to the Azlan mill, at which about three tons are worked per day. The wood for the mine is hauled three miles upon a good road recently made by the company, and water is plentiful.

In Bradshaw district, Luke & Co. have a force of 13 men at work building a road from Minnehaha Flat to the mill-site on Pine Flat, in Bradshaw Basin. It will be completed by about the first of April, at a cost of about \$5,000, and will be used for hauling in the Constanica mill, which is to be put up on the mill-site. The mill is now on the road from its former location, near Ehrenberg, and will be brought by Sam Miller's teams to Walnut Grove, he having contracted to bring it that far. The Thurman and Gretna mines and the mill, as soon as the present preparations are completed, will employ about 60 men. This mill will be a great advantage to Bradshaw district, where a great deal of good ore has accumulated for the lack of milling facilities.

In Mohave county, Barry & Williscraft have their steam arastra running on ore from the Cerbat mine, which is about half a mile north of the town of Cerbat. There are several thousand tons of ore in sight. This ore goes \$100 per ton in gold and \$50 in silver. The silver is left in the tailings. Messrs. Barry and Williscraft have a barrel and settler almost completed, and expect to have them running in a few days. They have run out quite a nice lot of bullion.

The Lone Juniper, in Peck district, belonging to John Goodwin and R. McKinnon, is another mine of promise. The shaft is down 35 feet. This mine was bonded yesterday to A. J. Holmes, of San Francisco, for \$15,000.

Colorado.

ANOTHER STRIKE.—Colorado Miner, March 31: We understand that the Surprise lode has been cut in the Braganza tunnel, on Leavenworth, showing from three to five inches of ore running from 250 to 500 ozs.

ANOTHER GREAT RUN.—The last mill run, had this week, of ore from the S. J. Tilden lode, the property of the Marshall silver mining company on Leavenworth, gave the following result: 4,500 pounds—nearly two and a half tons—without sorting, ran 1,007 ozs. silver per ton, yielding \$2,491.25.

NEW YORK MINING AGENT.—The New York Stock Mining Board has recently taken up Colorado property, and has appointed an agent in each mining district, whose duty it is to make a report of the actual state of the mine, and its probable value. He is employed to go to the mine and say what it is worth. He does this in the interest of the parties proposing to purchase.

SPECIE PAYMENT.—A fifteen stamp quartz mill is being erected in Idaho Springs for the purpose of crushing ore from the Specie Payment, located near the head of Virginia canyon. The mill is being built with a view to increasing its capacity, should the supply of ore justify.

PLACER MINING.—There is a fair prospect that the product of our placer mines will be fully up to the average; and we would not be surprised to see it largely increased the coming season. The companies now at work, or about to begin, number about fifteen, between the foot of Floyd Hill and Fall River. From two to fifteen men are employed by each, and as the season advances the number will be increased. At Fall River another effort will be made to reach the bottom of the deep channel, but likely in another place than that tried last year.

At Idaho, Dunn, Morris, Gibson & Co., have secured a claim of 5,000 feet on Idaho Bar and are sinking a shaft near the Stage Bar. They hope to strike bed rock in the deep channel and find that long sought rich pay streak, which all old gulch miners so firmly believe in.

At the mouth of Chicago creek, John Edwards is going to put in a Little Giant hydraulic—a California machine, which has proved very successful in Summit county. If it should prove equally good here he will at once order another one to be put in his mine at the lower end of Grass Valley Bay, where he is now at work with a horse power engine to keep the water out. Others will also introduce the Little Giant if it proves to be the right kind of a machine for these diggings. A good many of the miners working further down the creek have been at work all the winter, allowing their pay dirt to accumulate, which they are now sluicing. The miners are very reticent concerning the results of their labors, but it is pretty well understood that they get good wages. Half as good results in a new district would create a stampede.

Montana.

RICH STRIKE.—Helena Independent, March 29: One of the employees of the Rumley mine reached this city yesterday, and reports the striking of a very rich and immense body of ore in that mine. The strike was made in the tunnel which is being run to tap the bottom of a 200-foot shaft for the purpose of ventilating the mine. The ore body tapped is twelve feet wide, and free from extraneous substances, and richer than any heretofore found in that mine.

COPPER.—Butte Union, March 29: Operations at the various copper mines continue with but little change since our last report. On the Parrott lead, Park's mine, only a small force is engaged in taking out ore, and consequently the out-put is light. The total amount of first-class ore in the sheds will not exceed sixty tons. There is a very large amount of second grade ore at the mine which is now

being concentrated by the use of hand jigs. The operation though slow is successfully accomplished, and with the exception of the finest particles of ore, all is saved. The present season there has not been as much activity in copper mining operations as before, probably owing to the low price of copper and the failure to complete concentrators at a time when expected. The mines all show well, not only those that are being worked but a score of others which are idle.

THE BURLINGTON MILL is running very successfully and the percentage of bullion saved averages from 85 to 90. To a great extent this is due to the character of the Burlington ore, which is as free from bases as any ore in this camp.

WE FIND a large number of men at work upon the numerous claims in this vicinity upon which representation work is required. From the present indication there will be but few leads left for outside parties to re-locate.

THE CENTENNIAL MILL has been running during the week upon ore from the Mountain Boy.

A body of very rich ore has recently been struck in the Apex mine to the west of the Burlington mill. Heretofore this mine was supposed to be of very little value, but the find has caused no little excitement among its owners.

COARSE ORE is being very successfully treated at the Olin works, one ton an hour having been run through one day last week, but fine powdered ore cannot be concentrated by the process now in use. Some other method for this purpose is required, and Mr. Olin contemplates soon to obtain the necessary machinery to enable him to work not only the coarse particles but the powdered also.

CRUDE BULLION representing a coin value of \$3,000 was on Thursday last shipped to the Helena Assay Office from the Davis mill. Another shipment of a like amount will be made on the same day of this week. The working of the mill still continues very satisfactory and the wet crushing process is fast gaining popularity in this camp among the mining population. Machinery advocates are but a short time ago were ready to pronounce it a failure. The savings of the bullion contained in the ore averaged not less than 85 per cent.

PATENTS AND INVENTIONS.

A Weekly List of U. S. Patents Issued in Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING APRIL 30, 1877.

189,053. BRICK-YARD TRUCK.—E. Remillard, Oakland, Cal.
189,152. GRIPPING AND PROPELLING ATTACHMENTS FOR CARRIAGES AND LOCOMOTIVES.—J. J. Thomas, Cahto, and W. J. Anderfuren, S. F.

189,161. SHANK SUPPORTS FOR BOOTS AND SHOES.—G. W. Wells, Black Hawk, Col.

189,194. AUTOMATIC CHECK VALVE.—O. Collier, Sacramento, Cal.

189,204. CLAIMS FOR ENDLESS ROPK RAILWAYS.—W. Epelsheimer, S. F.

189,225. THILL-COUPINGS.—T. J. Hubbell, Yountville, Cal.

189,254. CLAMPS FOR BUTTON-HOLE SEWING MACHINE.—E. Moreau, S. F.

189,271. COMPOSITION FLUX.—C. F. Secor, S. F.

189,289. STEAM ENGINE GOVERNOR.—S. A. West, S. F.

4,613.—LAGER BEER.—Boca Brewing Co., S. F.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

New Mining Enterprise.

Mr. J. S. Phillips, M. E., has handed us the preliminary prospectus of the Gravel and Quartz gold mining company, to be incorporated under the laws of California, for working gold quartz veins and gravel deposits in La Plata canyon, near Parrott City, La Plata county, Colorado.

The property consists of four quartz claims, of 6,000 feet in length on the same vein, with a very extensive gravel claim of one mile in length, and two water ditches. This property has been bonded to Mr. Phillips on advantageous terms—to raise sufficient capital to erect a ten-stamp mill, and otherwise develop the claims. The original owners require no money payment, but are willing to rely on merits, by simply retaining one-half of the general stock, which shall be unassessable to them for twelve months only.

Mr. Phillips, therefore, proposes that the stock of the intended company shall be divided into 100,000 shares, and he desires subscriptions for the remaining 50,000 shares at half a dollar per share. Mr. Phillips himself, having examined the mines, will take 10,000 of the shares, give up business here, and go and superintend the mines for twelve months, as *pro rata* payment for the same. The whole of the money will be expended on the ground, as there is no privilege or perquisite to any one short of actual profit. The local advantages are excellent, for when the two ditches are completed, sufficient costless water power will be available for all purposes; mining labor is reasonably low; the country is plentifully wooded, and a sawmill is already at work in the canyon; the climate is good throughout the year, and as there is sufficient rain upon good soil, the grass is abundant, and therefore the principal foods for men and animals will be cheap.

Mr. Phillips states that there are at least 400 tons of high grade quartz now lying on the surface which he thinks, after reasonable deduction, will more than pay for the mill itself. The examination referred to above was made some 18 months since, at a depth of 30 feet, and just then the whole waste dump from the shaft yielded more than \$400 of free gold per ton, when an especially extended blast in the overlying rock still beyond the side of the shaft, and near the bottom, yielded an average of \$250, while one soft stone taken therefrom yielded \$3,900, and another stone, selected because it was hard quartz, wherein no gold could be seen, even with the assistance of the lens, produced \$79 per ton by fire assays. The shaft has since been sunk to 210 feet and at 110 feet a

drift has been run 80 feet to the southward; and it is said that the whole dump pile has been variously estimated at from \$80 to \$200 per ton. The local assayer states that the average of 300 assays, taken during drifting and sinking, was nearly \$500 per ton. Immense gravel deposits have been washed out during the formation of the canyon, where gold can invariably be found by washing the dirt in a pan from the very tops of the bars, which are, in many places, 100 feet deep. Mr. Phillips says in conclusion: "I may say that I have never seen a more interesting and apparently valuable quartz vein than this, even at that time, and after this much more extensive deeper proof, I have no doubt that it is a fine property and a rare chance, being not only very rich but lasting."

General News Items.

At the annual commencement of the New York Medical College for Women, nine ladies graduated, including Miss L. J. Kellogg of California.

DR. DIO LEWIS repeated his lecture on "Our Girls" to a good audience in Oakland, on Tuesday evening. He also recently lectured to crowded houses in San Jose and Santa Clara.

JOHN H. CARR, a son of Professor Carr, State Superintendent of Public Instruction, committed suicide at a hotel in Sacramento, on Monday last.

The Standard's dispatch from Berlin says: Bismarck will provisionally be contented with four months' leave of absence, but will not quit Berlin before the closing of the Reichstag. It is now doubted whether the question of his resignation will be settled before the reassembling of the Reichstag.

C. M. LOCKWOOD, of New York, Chief Clerk of the Patent Office, has been appointed Chief Clerk of the Interior Department vice Bell, appointed Secretary of the Interior, and F. A. Seely, of New York, Assistant Examiner, has been appointed Chief Clerk of the Patent Office vice Lockwood.

The Reading Railroad Company has given all the engineers employed on the Germantown and Norristown branch two days in which to determine whether to leave its employ or the Brotherhood of Locomotive Engineers. A Convention of representatives of the Brotherhood is to be held at once in Philadelphia, to determine on a course of action.

It appears that a conspiracy has been discovered for wholesale under-valuation of silk imported into New York. This is accomplished by the aid of manufacturers and agents in Europe, and it is believed by the connivance of the Customs officials. As nearly as can be learned, the average under-valuation is from 30 to 40 per cent. on the importation of many million dollars.

VERY extensive revenue frauds in the manufacture of tobacco in North Carolina have recently been discovered. Some thirty manufacturers in the county of Surry are charged with participation in these fraudulent transactions, and have been indicted. The frauds discovered are estimated to exceed one-third the total amount of internal revenue taxes collected in that State.

THE settlement between the heirs of Cornelius Vanderbilt has again been brought up on account of differences between William H. and Cornelius J. Vanderbilt. All the heirs with the exception of Cornelius had agreed to accept \$1,000,000, and William had agreed to a settlement on this basis. Cornelius J., however, made a claim of \$2,000,000, and his sister, Mrs. Lafatzie, refused to make any settlement until Cornelius J. was satisfied. Meanwhile the will has been admitted to probate.

ADULTERATED SULPHUR.—At a meeting of the San Francisco Microscopical Society held last week, Mr. Henry G. Hanks presented three mounted slides to illustrate the substitution of powdered sulphur for the more costly and pure sublimed sulphur. Mr. Hanks was requested by the Pharmaceutical Society to examine microscopically three samples of sulphur sold as sublimed, and obtained at three wholesale drug stores in this city, neither of which was found to be genuine. Sublimed sulphur under the microscope is seen to consist of globular particles and botryoidal and stalactitic masses, characteristic and readily recognized at a glance when known. Powdered sulphur, on the other hand, although similar in appearance to the unassisted eye, is shown by the microscope to be in the form of angular fragments of irregular size. As the pulverized crude material contains a certain percentage of foreign matter, it should be ranked among the adulterated articles when sold for the pure sublimed sulphur, as is usually the case.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

THE GRAND PACIFIC HOTEL—Such a thing as occurred at the Southern Hotel, in St. Louis, where thousands of dollars worth of property was destroyed and several lives lost, would not be apt to happen at the Grand Pacific in Chicago. The features for security against fire are exceptional. The construction is such that it will be impossible for a fire to extend beyond the small section in which it might originate. The fire electric system is adopted, furnishing instant alarm from all rooms. Four standing pipes of iron connect with the steamers at the sidewalk. By its own watchman alone the whole hotel could be flooded in a few minutes, and in all these features the hotel has been guarded carefully against fire. These, with the first-class appointments of the house, make it a favorite with the traveling public.

Mining and Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

DEWEY & CO., Publishers, S. F.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.
B. W. CROWELL—Colusa, Butte, Sutter and Yuba counties.
G. W. McGREW—Santa Clara county.

Ed. T. PLANK—Dakota Territory (Black Hills.)

WHEN so many poor watches are being sold, it is not too much for us to say that those who buy the New York Watch Company's movements will be sure of a good article at fair prices.

ROASTING OF GOLD AND SILVER ORES, and the Extraction of their Respective Metals without Quicksilver, 1870. It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. Price \$2.50 coin, or \$3 currency, postage free. Published and sold at this office.

Mining and Scientific Press Patent Agency.

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free. Address,

DEWEY & CO.,
No. 224 Sansome St., S. F.

UNITED STATES Mineral Land Laws, Revised Statutes, AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained posted on Claim during Time of Publication; Register's Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Change of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. **DEWEY & CO.,** Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

Our readers can see watches second to none of American make, by asking "the time o' day" when our agents call. They travel by the N. Y. watch, and are very proud of them.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of chloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Krichke's process, etc. Under "Pulverizing Machines" are described the amarra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel, trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's teaching apparatus, with two or three different arrangements, a small mill, sampling tallies and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners' and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., Mining and Scientific Press, 224 Sansome Street, San Francisco.

To Mining Secretaries.

An amendment to Section 330 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

California and Arizona Mining Company.—Location of principal place of business, 507 Montgomery Street, San Francisco, California. Location of works, Mohave County, Territory of Arizona.

Notice is hereby given, that at a meeting of the Board of Directors, held on the third day of April, 1877, an assessment (No. 2) of two cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin to the Secretary, at the office of the company, 507 Montgomery Street, San Francisco, Cal.

Any stock on which this assessment shall remain unpaid, on the thirteenth day of May, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the fourth day of June, 1877, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors, **P. E. JEWELL, Secretary.** Office, 507 Montgomery Street, San Francisco, California.

Dolores Consolidated Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Dolores Mining District, Esmeralda County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the seventeenth day of February, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

Name	No. Certificate	No. Shares	Amount
Blasdel, H. G., Trustee	16	10,000	\$1,000 00
Blasdel, H. G., Trustee	17	5,000	500 00
Blasdel, H. G., Trustee	18	5,000	500 00
Blasdel, H. G., Trustee	19	5,000	500 00
Drexler, L. P. & Co., Trustee	8	25,000	2,500 00
Fry, J. D., Trustee	7	10,000	1,000 00
Keene, J. R., Trustee	9	10,000	1,000 00
Talbot, W. C.	3	100	10 00

And in accordance with law and an order of the Board of Directors, made on the seventeenth day of February, 1877, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of said company, on Monday, the sixteenth day of April, 1877, at the hour of two o'clock, P. M. of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of sale.

J. W. CLARK, Secretary. Office, 418 California street, San Francisco, California.

POSTPONEMENT. The sale of the above described certificates of stock is postponed from the 16th day of April, 1877, to the 16th day of May, 1877, and will then take place at the same hour and place as above named. By order of the Board of Directors, **J. W. CLARK, Secretary.**

Klamath Quartz Mining Company.—Notice is hereby given that the principal place of business of this company will be removed to Klamath Mill, Siskiyou County, California, from the City and County of San Francisco, California, in thirty days from the date of the first publication of this notice. **GEORGE H. FOREE, Secretary.** San Francisco, March 21, 1877.

Mariposa Land and Mining Company of California.—Location of principal place of business, San Francisco, California. Location of works, Mariposa County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of March, 1877, an assessment (No. 10) of one dollar per share was levied upon the capital stock of the corporation, payable immediately in United States currency, to the Secretary, at the office of the company, Room 33, Nevada Block, No. 309 Montgomery Street, San Francisco, California, or to the Assistant Secretary, at the office, No. 9 Nassau Street, New York.

Any stock upon which the assessment shall remain unpaid on the Thirtieth day of April, 1877, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Monday the Twenty-fifth day of May, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors, **LEANDER LEAVITT, Secretary.** Office, Room 33, Nevada Block, No. 309 Montgomery St., San Francisco, California.

Taylor Mill and Mining Company.—Principal place of business, City and County of San Francisco, State of California. Location of works, Garden Valley Mining District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the twenty-ninth day of March, 1877, an assessment of Twenty Cents per share was levied upon the capital stock of the company, payable immediately in United States gold and silver coin, to the Secretary at his office, No. 607 Montgomery Street, in the City and County of San Francisco.

Any stock upon which this assessment shall remain unpaid on the ninth day of May, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Friday, the twenty-fifth day of May, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. **SAMUEL S. MURFEY, Secretary.** Office, No. 607 Montgomery Street, San Francisco, Cal.

Amusements.

GRAND OPERA HOUSE, Mission Street, near Third. Open every evening with first-class Dramatic Company. Box office open from 9 A. M. to 10 P. M. Doors open at half past seven. Commence at eight o'clock.

CALIFORNIA THEATER, Bush Street, above Kearny. Open every evening with the best Dramatic Company in the United States. Box office open from 9 A. M. to 10 P. M. Seats may be secured six days in advance. Doors open at half past seven.

SCIENTIFIC PRESS.—As the old year is drawing to a close and the new is rapidly approaching, all our mining friends should subscribe for this scientific journal, especially devoted to their interests. It is a California enterprise, and compares favorably with similar organs of years more experience and age in the old countries.—*Colfax Enterprise.*

TOLLES IMPROVED CONCENTRATING TABLES.

Improved Concentrating Tables.

The illustration on this page represents an improvement in concentrating tables for ores recently patented through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, by J. U. Tolles, of Virginia City, Nevada, who has been using the apparatus very successfully in several places. In the engraving, A represents a flat inclined table provided with a surfacing of cloth or other suitable material of any kind, and with the ledges b, to prevent the material from passing over the ends. B represents a peculiarly constructed feed box extending along the upper edge of the table, and provided in its front side with a row of discharge openings, c, of the form shown, each narrowing down to its lower end and of such a size as the nature of the material requires. C represents a receiving box or trough, extending along below the lower edge of the table. D represents a leaf or board hinged to the rear side of the trough or box C, in such a manner that it may be turned under the edge of the table to conduct the valuable material therefrom into the box, the refuse passing over the edge of the table and discharged upon the ground, or into the box in the rear of the box C. E represents a rotating tube or pipe suspended lengthwise above the upper edge of the table by endless belts d, passing over pulleys e, supported in the rigid frame F, or by brackets fastened to the frame and extending under the proper distance over the table, the tube rotating and carrying upon them the material as shown in Fig. 2. The tube is provided from end to end with a row of perforations, and with a hand lever, h, at one end, and is connected by a hose i, to a tank, pump or reservoir, delivering water at a pressure of from eight to 12 feet of head, as the nature of the case requires.

In operating the machine the feed box is narrowed to about one inch at its farther end, or has a strip of board set edgewise in the bottom, and running obliquely across the same from the rear to the front side, causing the material to gradually be brought to the front and discharged through the feed holes c, upon the table, thereby insuring an even distribution and steady flow of the material to be treated; a steady and copious supply of water is maintained in the box, and the ores, sands or tailings introduced therein. The water escaping through the openings, c, flows down in a thin light stream over the face of the table. The mineral particles are deposited upon and retained by cloth or other surfacing material on the face or bed of the table, while the light refuse matter is carried over the lower edge and discharged outside of the box C. After the collection of a suitable amount of metal upon the

table, the supply of water, etc., to the feed box is stopped by the gate and turned upon the other table. Clear water is now supplied to the first pipe, E, and allowed to run down over the table (for a moment,) washing off the remaining refuse sands, and at the proper time the hinged leaf D, is drawn (by the rod) under the edge of the table, the pipe being rotated or turned and the water thrown through the perforations upon the table in a row of fine jets, forming an almost continuous sheet or film. By means of the lever h (which should be fastened on the pipe at right angles to the line of perforations), the tube is turned and the sheet of water swept over the table from the top to the bottom so as to drive all adhering particles therefrom and wash them down into the box C. After this operation the jets are stopped from this tube, the leaf

thrown back, and the gate shipped to the other feed box, the feed water coming back on to the first table, the operation being repeated as often as it is seen the tables are charged with the sulphurets or other valuable metals.

By employing the proper kind of cloth, grooves, riffles, or copper plating, or all of them combined, and giving the tables the proper grade, and properly regulating the flow of water, the inventor finds that he can effect a very rapid and thorough separation without agitating the table, and without power of any kind except the manual labor requisite to change the feed from one table to another, and washing them off by means of the water used in the pipes; he also finds by the employment of the fixed table he can separate particles which cannot be retained in machines which vibrate. By the use of the feed openings, c, of the form shown, the discharge of the sand, ore or other fine material is rendered very steady and gradual, as it will be carried through the narrower portion of the openings, while the lighter water will pass over the same through the upper large end of the openings, taking up the material very gradually and distributing it very evenly upon the table. It is obvious that the rotating tube may be sustained in any other manner, and that it may be connected in any suitable manner with the source of the water.

The object in arranging the perforated pipe so that it can rotate is to permit a gradual change in the direction of the jets, so that their point of impact upon the table can be advanced from its upper to its lower edge, and thereby every portion of the surface subjected in turn to the direct impact of the jets, in order to effectually loosen and drive forward the particles therefrom.

The flow of water can be regulated by the valves operated by the cords. The gate shown in the feed trough, G, will throw the water into either feed trough as desired.

The plugs in the ends of the pipes, E, are for the purpose of freeing them of any obstructions.

Fig. 3 represents the most convenient form of erecting the tank or reservoir which supplies the tubes with water, it usually being placed directly overhead with water shed underneath.

Mr. Tolles with this apparatus does not profess to do what many others claim to do, but he is running many of them where everything else has failed. He has been running several of these tables on the Comstock for nearly two years and is now building more. By using the proper kind of sizing apparatus in connection with the tables, the inventor is doing some very close work with them at a nominal expense of constructing, running and keeping in order. He states that any person using anything of like nature, or any portion of the same for like purposes, without first obtaining license for so doing will be prosecuted for damages for such use. Persons at a distance can build and run them by first obtaining license and instructions from the inventor, John U. Tolles, at Eureka, Humboldt county, California, or W. S. Tolles, his authorized agent at Virginia, Nevada.

Iron and Machine Works.

PACIFIC ROLLING MILL COMPANY,

SAN FRANCISCO, CAL.

Established for the Manufacture of
RAILROAD AND OTHER IRON

Every Variety of Shafting,

Embracing ALL SIZES of

Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames,

Hammered Iron of Every Description and Size.

Orders addressed to PACIFIC ROLLING MILL COMPANY, P. O. Box 2032, San Francisco, Cal., will receive prompt attention. Office: 10 First Street.

J. B. REYNOLDS,

(Room 10,) 320 Sansome Street

THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at \$6.....	\$12 00
Two firemen at \$4.....	8 00
1,500 lbs of salt at 1 1/2c.....	22 50
Wear of shoes and power.....	1 50
Cost for 15 tons.....	\$44 00
Cost for one ton.....	2 93 1/2

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

PICKERING ENGINE GOVERNOR.

VALLEJO FOUNDRY, October 17th, 1876.

Messrs. NEYLAN & YOUNG, San Francisco.

Agents for "PICKERING GOVERNORS."

Genl: The 10 two-inch Improved Speed Adjusting Governors I bought of you this year for my patent Straw Burning Threshing Engines give splendid satisfaction. They far surpass for regularity of speed any Governor that I have ever seen, and I have seen all the best kinds; I have seen the main belt fly off the pulley several times this season while threshing, and the engineer did not discover it, so perfectly was the speed maintained, until he was told of it; this I consider something wonderful; I consider the Governor absolutely perfect, so far as speed is concerned. I bought and put on to one of my engines a Shive Governor, to see which was the best, and after one season's trial I have no hesitation in saying they are far superior to any other Governor that I have seen or used. I wish you would send me the lowest price that you can furnish 25 Governors for next season's engines.

Yours respectfully,

J. L. HEALD.

The only Governor that has received awards at each of the International Exhibitions. American Institute Fair, New York, 1865, Two Medals; Mechanics' Institute Fair, Baltimore, 1865, Silver Medal; American Institute Fair, New York, 1869, Two Medals; International Exposition, Paris, 1867, One Bronze and Two Special Medals; International Exposition, Vienna, 1873, Medal of Progress and Decoration; International Exhibition, Philadelphia, 1876, Medal and Diploma.

PATENTED CAST STEEL SHOES AND DIES.

Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents
to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of iron from which our Steel is manufactured, and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at twelve cents per pound, delivered at San Francisco or Sacramento, instead of sixteen cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gun Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc., etc.

Address all orders, with dimensions or drawings, to

CAST STEEL SHOE & DIE CO.,

59 Nevada Block, S. F.

\$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

REFERENCES.

A letter received from the Julian Mill, Newcastle, says of the Carrier Feeder: "It is the most perfect Feeder we have ever seen; don't see how any mill can do without them." A letter from Mr. C. C. Belding, of Amador County, speaks in the highest terms of them. Two of the machines were shipped to the Bunker Hill Mill, also Gover Mill, Amador County. Mr. Stevenson, of Boston Mill, Gold Hill, Nevada, says they are the best Feeder he has ever seen. Soulsby Mill, Tuolumne County. California Company, Nevada City. Omaha Gold Mining Company, Grass Valley. St. Patrick Mill, Placer County.

\$1,000 CHALLENGE.

Backward in Coming Forward.

C. P. Stanford Fails to Come to Time on the Challenge of \$1,000 to Test the Merits of His Ore Feeder as Against Mine. The Challenge is Still Open to Him or any one else. GENTLEMEN, Put up or Shut up.

A letter has been received from the Crescent mine, Plumas County, in which it states that the Tulloch is a failure as against the \$1,000 Challenge Feeder of Hendy's.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

For Description, Send for Circular to

J. HENDY, Sole Manufacturer,

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by
J. EY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the
Extraction of their respective Metals without Quick-
silver. 1870.

This rare book on the treatment of gold and silver ores
without quicksilver, is liberally illustrated and crammed
full of facts. It gives short and concise descriptions of various
processes and apparatus employed in this country
and in Europe, and explains the why and wherefore.
It contains 142 pages, embracing illustrations of furnaces,
implements and working apparatus.

It is a work of great merit, by an author whose reputation
is unsurpassed in his specialty.
Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including
the Chlorination Process for Gold-bearing Sulphurets,
Arsenurets, and Gold and Silver Ores generally, with
120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing
the subjects treated. Its authority is highly esteemed
and regarded by its readers; containing, as it does, much
essential information to the Miner, Metallurgist,
and other professional workers in ores and minerals, which
cannot be found elsewhere in print. It also abounds
throughout with facts and instructions rendered valuable
by being clearly rendered together and in simple order.
It contains 120 diagrams, illustrating machinery,
etc., which alone are of the greatest value. PRICE, \$7.50.

A VALUABLE MINING BOOK.

BY J. S. PHILLIPS.

The Explorers', Miners and Metallurgists' Companion,
652 pages, 83 illustrations. Second Edition. A California
publication.

OPINIONS OF THE PRESS.

The book is exactly calculated to suit the views and
meet the requirements of those for whom it has been
written.—*London Mining Journal*.

The most practical and comprehensive work on mining
subjects extant, and valuable book of reference.—*Mining
and Scientific Press, San Francisco*.

We know of no work on these subjects in the English
language at once so comprehensive, practical and intelli-
gible.—*S. F. Golden Era*.

This book, which treats in an intelligent and practical
way on almost every topic connected with mining pursuits,
should be in the hands of every millman, metallurgist,
prospector and miner on the Pacific coast. Even the cap-
italist, and, in fact, every person already engaged in, or
likely to become interested in the business of mining,
will find in this comprehensive work an amount of infor-
mation that he cannot afford to dispense with.—*S. F.
Commercial Herald*.

This book is free from trash, and solid throughout; all
its matter is intelligible to men of ordinary education, and
all of it is valuable to miners.—*S. F. Daily Alta*.

In the several sections the work is eminently practical.
Is very comprehensive, and contains a great deal of useful
information which cannot be obtained from the previous
books that have been written on these subjects.—*S. F.
Daily Examiner*.

It affords a vast quantity of information as to the ap-
pearance and value of different ores.—*S. F. News Letter*.

It is the best single English treatise we know for the use
of prospectors and practical miners.—*The Engineering
and Mining Journal, New York*.

Sold by Dewey & Co., at this office. Price \$10.50.

We can recommend the New
York watch, of Springfield, Mass.,
as A 1.

The Value of a Correct Time Piece.

[Scene on the S. F. & Oakland (C. P.) R. R.]

"Be sure you are right, then go ahead." *Davey Crockett*.

But how can you ever be sure you are right? Then stop buying unreliable watches when it
costs but a trifle more to get one of the true time keepers made at Springfield, Mass., by the
N. Y. Watch Co. They never fail. Prices reasonable and every watch guaranteed, by the
reliable firm of DEWEY & JORDAN, No. 433 Montgomery Street, San Francisco.

FRET WORK DRILL.

Fancy Wood Workers, Model Makers, Wood Engravers,
Mechanics and all persons who have occasion to drill small
holes in wood or metal, will find these machines superior to
any other hand device for drilling, and in many respects
superior to a power drill, as they can be used in any position,
and on any surface, large or small.
Have fine tempered Steel Bits, and will do the most deli-
cate work without danger of splitting. Sent by mail, with
one extra bit, for \$1, (with five extra bits, assorted sizes, for
\$1.25.) Nine dollars per dozen.

COLMAN SMITH, New Haven, Conn.

THANK-OFFERING.—Rev. S. S. Harmon, President of
Washington College, an interested observer of agricultural
progress, writes: "I have just been looking over the
RURAL PRESS. I am most favorably impressed with its
contents. Its range of agricultural matter is wide and
deeply interesting. One such number as the last is worth
the price of the whole volume. It is a great, good work
in which you are engaged, your audience is very large and
should become larger every day. I do not know that
truisms of this kind are of any value to you, but I write
them as a sort of thank-offering for what I deem to be a
very valuable service you are rendering to the State."

N. W. SPAULDING'S

ERICH G. GAERTNER,
MINING ENGINEER.

All classes of mining properties reported on, consulta-
tions had on reduction of ores of all descriptions, plans for
furnaces and reduction works furnished, and the construction
of them superintended. Ore tests made at the o-
fice,

309 California Street, Rooms 8 and 9.

PACIFIC RURAL PRESS,

A first-class 16-page Illustrated Agricultural Weekly, filled
with fresh, valuable and interesting reading. Every
farmer and ruralist should take it. It is im-
mensely popular. Send for a sample copy.

DEWEY & CO., Publishers, S. F.

THE MINING AND SCIENTIFIC PRESS was established in
1860. It is the only scientific and the only mechanical
journal in the Pacific States; circulates largely in California,
Nevada, Oregon, Idaho, Montana, Utah, Arizona and
Colorado, among the most influential professional and
intelligent industrial classes; it is read and filed in the
manufacturer's office, the shop, the mill, the miner's
cabin and mechanic's home; the population in its jurisdic-
tion—now rapidly increasing—is thrifty, enterprising and
"building up," with better times than prevail in other
quarters of the Union.

VOLUME XXXIV.
Number 16.

Arizona.

We had a conversation this week with Mr. D. S. Lusk, of Sacramento, who has just returned from Arizona, bringing with him some very rich specimens of ore running from \$800 to \$22,000 per ton. He is here now for the purpose of obtaining a quartz mill, which he intends taking to the Bradshaw mountains, about 45 miles from Prescott. At this place there is plenty of wood and water for the mill, and there are over 100 paying claims near by turning out ore, which will run from \$50 to \$3,000 to the ton.

Mr. Lusk is quite enthusiastic over the mining prospects of Arizona and thinks the Bradshaw mountains the best mining country on the coast. They are well timbered and there are running streams with from 50 to 5,000 inches of water. He reports quite an extent of unprospected country in the Bradshaw mountains, and says new ledges are discovered every day; but it is no place for a poor man to go yet, as there is no labor required, there being no reduction works in which ore can be worked. Most of the new comers are going to Globe district, where the ores are very rich, but some are leaving there also, as they can get no employment and even if they find rich ledges and can get no ore worked, they are little better off, as far as immediate requirements are concerned, than if they had nothing.

In the Bradshaw mountains there are a number of prospectors at work and more are coming, but the great want of the country is reduction works. Expenses are not very heavy, but still are such as will not warrant men without means going there. In Prescott board and lodging can be procured from \$17 to \$20 per week. In that vicinity flour is from \$10 to \$12 per hundred; bacon and ham, 45 and 50 cents per pound; sugar, 28 and 30 cents; butter, one dollar per pound; eggs, one dollar per dozen, and other things in proportion. There are plenty of deer and wild turkeys and beef and mutton are cheap. A miner can live in his cabin from \$30 to \$40 per month. Labor is all the way from one dollar to four dollars per day when there is any demand for it, but there is no chance for employment at all. None of the mines are developed sufficiently to need miners, and it hardly pays to get out much ore without means of reducing it. Mr. Lusk says no man without means to live upon for a year need come there, as it will be at least that long before milling facilities are provided, for they take time and capital.

As far as the expenses of a trip to the Arizona mines are concerned they depend, of course, on the camps selected. To go to Prescott from here the fare is \$75 and meals on the way cost about \$10. It takes from five to six days to get to Prescott. Mr. Lusk made the quickest trip yet made, as it only took him four days and 17 hours. As the railroad nears the Colorado river, however, the time is materially shortened. Mr. Lusk says that there is a first-rate opening in Prescott for a "live" hotel-keeper and also a good chance for a livery stable. In the mines thereabouts, there are plenty of men taking out ore and working a little to keep along for the "good time coming," but it is no place for poor men. Our informant speaks highly of the agricultural resources of some parts of the Territory which he visited. He says the Salt River valley cannot be beaten. The soil will produce largely and grows corn, sugar-cane, cotton, fruits, alfalfa, etc. About the San Pedro river there is plenty of good land for agricultural purposes and also some very good mines.

COPPER.—The copper market in Liverpool is not very brisk, there being but a moderate business doing. Latest quotations are: Chile bars, 270 5s to 270 10s per ton for good ordinary brands; ore, 14s, and regulus 14s to 14s 3d per unit. Stocks of west coast produce on the first instant were 13,847 tons fine, against 12,980 tons on the first ultimo.

INCREASING HOURS OF LABOR.—A dispatch from Virginia, Nev., states that the Consolidated Imperial mining company has adopted the rule of making 10 hours a day's work for mining below ground, and requiring men working on top to put in 12 hours.

Changes of Level in the Earth's Surface.

EDITORS PRESS:—Without claiming exactness, the accompanying diagram is intended to represent the apparent relative altitude of the highest peak of the Butte mountain and the Coast range before and after the earthquake of 1868. The highest peaks of the Buttes appeared at all times and in all conditions of the atmosphere, when visible, to be clearly above the line of the Coast range. The second peak always appeared to be just below the line of the Coast range. The period of observation was from the autumn of 1862.

It is my impression now that the Buttes were slowly rising up to the time of the earthquake. I give it as an impression only. For some weeks before and after the earthquake the view of the mountains was obscured by the smoky state of the atmosphere. For some days, about

southwesterly direction from point of observation.

Detailed facts of this kind are to be found too numerous to mention. The soundest and firmest earth is itself in motion. Many of the observations of the earlier astronomers were vitiated by the constant oscillatory movement of the earth's crust. Such facts lead to the unavoidable conclusion that the solid crust of the earth rests upon a yielding surface. That the rock material of which the interior of the earth is composed is made yielding by heat is shown by the immense periodical flows of lava which occur. Now, the molten interior of the earth is constantly cooling, leaving the crust too large for the ever-shrinking mass it contains. The solid crust can only follow by collapsing and bending until the breaking point is reached. Then comes the earthquake or break, and a new adjustment is made and the earth is again restored to its spherical form, to be followed by another collapse and break, to be repeated as long as the earth endures, or until it is congealed to its very center.

MARYSVILLE BUTTES BEFORE AND AFTER EARTHQUAKE OF 1868.

the time of the earthquake, the atmosphere was so dense as to nearly if not quite obscure the sun and render it difficult to distinguish objects but a half a mile distant. This obscurity did not arise from clouds, but as I then supposed from the smoke of a volcano in active eruption in the far north.

After the atmosphere became cleared by a fall of rain, to my surprise I was able to see a clear line of the Coast range above the highest peak of the Buttes, and it was the same in all conditions of the atmosphere when the mountains were visible. I called the attention of many others to the fact. I had to go down the hill at least 300 feet lower than my dwelling to bring the Buttes up to the height they appeared before the earthquake. Before the earthquake

It seems remarkable that no more has been done by geologists towards a systematic observation and calculation from such phenomena. It might lead to such knowledge as would enable us to tell with the most unerring certainty when the period for a destructive earthquake was at hand in any given locality. Certainly we are presented with a most favorable opportunity for such observation in the undulatory movements of the Butte mountains. These movements must be caused by the lateral pressure in the earth's crust, and might be observed up to the breaking point.

The phenomena which I have recorded was unlooked for, and consequently I was unprepared for making accurate observations. I can say, to the best of my recollection, however, that the lower point of the mountain, in the illustration, was up so as to leave but barely a line of the coast mountain visible above just prior to the earthquake.

F. A. HERRING.

The Wilcox Conical Valve.

I went up the hill at least 200 feet and could not bring the highest peak of the Buttes down on a level with the line of the Coast range against the horizon.

Since the earthquake the buttes have been slowly rising until now they are apparently nearly up to the position they seemed before.

In the illustration, *a* is a profile line of the Coast range; *b*, highest apparent altitude of the Marysville buttes prior to the earthquake of October 21st, 1868; *c*, apparent altitude after the earthquake. The point of observation is located on the western slope of the Sierra Nevada, at an altitude of about 2,500 feet, near Forbestown, about 30 miles from and in a north-easterly direction from Marysville, California. The Butte mountains are located in the Sacramento valley, about 30 miles from point of observation. The summit line of the Coast range is about 60 or 70 miles beyond the Buttes in a

Mechanical Ore Concentration and Separation—No 30.

[Written for the Press by FRANCIS M. F. CAZIN, M. E., Santa Fe, New Mexico.]

Administration of the Works.

The administration of mineral-dressing works should not be in the same hands as that of the mine furnishing the ore, because a mutual control will always prove beneficial to the mine-owner. The facility of weighing and sampling all the ore treated, even in the most frequent cases where mine and works have the same owners, will result in a wholesome insight into the workings of both mine and works, and the entire financial independency of one from the other will stimulate both to promote economy. Skilled labor in these works is as important as

others, but as, on this continent, it is very scarce, the constructor should be able to train all hands required. The lack of this ability would result in long and costly inconveniences.

Both requirements, construction and putting into operation of mineral dressing works are on the European continent a specialty, for one of the most extensive machine builders and iron founders (Maschinenbau - Actien - Gesellschaft Humboldt, at Kalk, near Cologne), and in England the same is followed as a specialty by a machine company in Glasgow; but in the United States, as yet, no beginning deserving attention has been made, although there is more need for such an establishment on the Pacific coast than in any other country on the globe, and no doubt with good earnest we would achieve in mineral dressing here what in mill practice is unanimously conceded to us, viz: a progress leaving behind all precedents.

But in order to do so, we should prepare by a thorough knowledge not only of what has successfully worked heretofore, but what has proved erroneous in principle or practice, and should protect ourselves against all invention and patent humbugs, either monopolizing old useful contrivances or resurrecting old machines long ago rejected by intelligent practice. Progress is certainly possible and probable, but only based on true and established principles, and only within the limits of special application; but not in the shape of panaceas, as nearly every innovation is put up for with the ignorant ones. A machine company for the special construction of mineral dressing works under experienced and intelligent administration in San Francisco would certainly be the first and best step to acclimatize the trade in the country and to facilitate financially its introduction where there is so enormous need for it.

Wilcox's Conical Pump Valve.

The accompanying cut represents one of W. C. Wilcox's improved water valves, which is designed especially for working under heavy pressure. It will readily be seen that the construction of the valve is such (being, when seated, entirely encased in metal) that no amount of pressure can crush it. Any expert examining the valve will readily see the ease with which water can pass through it in comparison with the usual form of valve which consists in openings through a horizontal surface, covered by a plain horizontal valve; hence the water, on passing through strikes the cover and reacts upon itself, thereby causing a great loss of power as well as capacity to carry water in proportion to the size of the openings. By the peculiar shape of the valves illustrated the water starts in a line on its way up, meeting with none of the usual obstructions.

The valve was the invention of Mr. W. C. Wilcox, of this city, and he is now putting it on such pumps as are intended for heavy work. For mining pumps it is first-class, the openings being large in proportion to the pipe, and there being nothing to get out of order. These valves are working in some of the Wilcox pumps which are hoisting water 500 feet perpendicular, and giving entire satisfaction.

CHIEF JUSTICE WAITE has announced that, on account of the insufficient appropriation, the Supreme Court will be unable to sit after May 15th, and will, therefore, not hear cases later than May 7th.

CORRESPONDENCE.

Mills and Mines at Pioche, Cherry Creek and White Pine in Eastern Nevada.

[From Our Traveling Correspondent.]

Pioche, the county seat of Lincoln county, is at present unusually quiet. Like the sick man at the pool of Siloam, she seems to be waiting in patience and faith for "the moving of the waters." Little is going on outside of the Alps, the Meadow Valley and the Raymond & Ely, and these, unless the first named is excepted, are doing comparatively little. The principal lode of the district, on which the Meadow Valley and Raymond & Ely are located, lies in the quartzite, not far from the limestone, and is looked upon as a true fissure. It varies in width from three to 15 feet. Its productiveness in the past needs no repetition. The number and amount of its dividends will not soon be forgotten, but a cloud at present overshadows it. There is no good reason to think that the trouble arises from any diminution in either the quantity or quality of the ore, as it is reported as at least of good fair grade at the greatest depth attained. If the immense body of water encountered at the 1200-foot level by the two leading companies can be permanently lowered, there is every reason to believe that the district will regain her wonted prosperity, and bask anew in a sunshine as bright and glowing as that which gladdened her palmiest days.

The Meadow Valley M. and M. Co., J. B. Duff, Esq., Superintendent, have already in place a portion of their pumping machinery, said to be equal to anything on the Comstock of the same capacity, and are awaiting its completion before anything further can be done towards developing the mine. The vein at the greatest depth reached is represented as a true fissure and better defined than in the upper levels. The ore has changed from a chloride to a sulphide of silver, averaging \$125 per ton. Some ore is still extracted from the upper works. Nothing very definite was learned as to the intentions or future movements of the company.

The Raymond & Ely M. Co. Had also reached the 1200-foot level, where the water was struck, and appear to have been gaining upon it, when one of the gear wheels of their powerful machinery was accidentally broken. While waiting for repairs, they have been engaged in searching for new bodies of ore in the upper levels, where there is still a large amount of undeveloped ground, which gives fair promise of yielding bodies of paying ore. All the tailings from the whole of the ore worked from the very outset have been preserved in good shape to the amount of 6,000 tons. Capt. H. H. Day, the Superintendent, sets their value in the gross aggregate at \$2,000,000. The company have two fine mills, one of 30 and another of 20 stamps, which are now ready to start upon the tailings, besides working the ore that may be taken from time to time from the mine.

They have also a narrow-gauge railroad from mine to mill, 20 miles in length and rolling stock complete, which gives them cheap and rapid transportation for their ore. In addition to this they have connected with their works a well appointed foundry and machine shop, ample not only for all their own requirements, but for much custom work called for in the vicinity.

§The Alps S. M. Co.

Mill of 15 stamps, 6 pans and 3 settlers, at Pioche, is kept busy on custom and Alps ore. But owing to scarcity of water, is running day-time only. It has been largely dependent upon the Raymond & Ely mine for a supply of water and will not be able to run 24 hours, until that company's pump shall have started. The Alps Co. have at their mill some 6,000 tons of valuable tailings which are waiting for an increase of water before they can be worked.

They have also leased the Newark mill in Condon canyon, which is running night and day, partly on concentrations and partly on custom ore,—a large portion of the latter coming from the mines of A. T. Barber, at Leeds, Utah, of which mention was made in a late letter from that district. Mr. J. H. Collier has charge of both mills. The mine is being thoroughly prospected on the lower level with very favorable indications—what ore that is extracted coming from the upper works. A. J. Blair, Esq., is the Superintendent.

On the road from Pioche to Cherry Creek there was

A Lost Vein Luckily Found

Somewhere about the 1st inst. (April) from 20 to 30 miles from Ward. It was V-shaped and evidently no true fissure. The "honest miner" would have little thought of locating it. Its contents carried not a trace of either gold or silver. It is needless to say

"Who steals my purse steals trash, 'tis something, nothing; But he that filches from me my good name, Robs me of that which nothing enriches him, And makes me poor indeed."

In the way of "the needful," it contained nothing but greenbacks, but what was of far more importance, papers of value, affecting the interests of others, the loss of which might have seriously damaged one's reputation for honesty and integrity. Thanks to Mr. Fred. Gilmer, agent at Ward for Gilmer, Salisbury & Co.'s daily stage line from Pioche to Eureka. No sooner were the facts laid before him than he set out on the uncertain search. Thanks also to the honest young employee of the Co. at Beef Station into whose hands it fell. The pocket memorandum with contents entire were promptly forwarded within 24 hours from the time it was found missing.

§In Robinson District.

White Pine county, only a few claims are being worked, from which you will hear something in due time if the results are as favorable as anticipated. Between this and Cherry Creek there are two new and promising camps, lying on opposite sides of the same range, known as Granite and Hunter mining districts. The latter is creating at present quite a stir and promises to be unusually lively the coming summer.

Cherry Creek,

Also in White Pine Co., presents many of the marks of a good metalliferous neighborhood. The visitor is struck with astonishment at the external indications that meet him on every hand in the character of the wide spread float rock, the bold and massive cappings and other unmistakable signs of mineral. Knowing as he does that nature never misleads if her language is rightly interpreted, he is led to wonder why so little comparatively has been done in view of the encouraging prospects.

The district contains a number of excellent veins and much rich ore, but litigation has been the bane of the camp—not a bad sign, by the way, as going to show that there is something here worth contesting. It is hoped that drawbacks of this kind are about ended. A brighter day is already beginning to dawn. The present outlook is far more hopeful than ever it has been here, and events are thought to be shaping themselves in such a way as to soon render it one of the most prosperous districts of eastern Nevada.

A few cases will now be given, showing the formation, size of veins and value and kinds of ore.

The Pacific Consolidated S. M. Company

Are working their mines through a tunnel, stopping ore from the upper levels, and sinking a winze at the same time from the tunnel level, with splendid prospects of developing a good body of ore. It has already passed through two or three strata of good ore, which is believed to be the extreme south end of a fine chimney previously struck above. A drift will be extended north through the ore body as soon as the depth of 1,000 feet is reached. Vein eight feet in thickness; direction north, 30° east. The country rock seems to dip generally to the west, while the lode dips east at about the same angle (45°). The ore, usually found in chimneys with strike to the south, varies in value from \$60 to \$180 per ton. Mr. J. H. Roberts, the Superintendent, characterizes it as a true fissure vein, cutting in its course both the granite and porphyry.

The Mary Ann, at present worked through the same tunnel, continues northerly 1,500 feet to the Flagstaff. The vein is said to be strong and the out-crop very large.

The Flagstaff is opened by three shafts, showing good bodies of ore, and will also be cut by the same tunnel as the last mentioned.

The Geneva Consolidated M. Company,

Mr. J. T. Maclean Superintendent, own the Ticup and Geneva, the former being opened by incline 575 feet on the vein. It lies between the slate and the limestone; width from one and a half to four feet. It is said to be traceable for not less than seven miles, with ore at intervals the whole length. Selected ore has heretofore worked from \$480 to \$560 per ton, but as the company have a mill of their own, they prefer to work all classes together, and are making it average them \$154 per ton. The character of ore, bromide-chloride and black sulphurets of silver. It works up to 94% of assay value without roasting. Hoisting works are in process of erection. As soon as completed a full force will be put on, when the mine will no doubt become very productive.

The Geneva is represented as a good, large contact vein, between the quartzite and limestone, the ore carrying a high percentage in gold and averaging \$250 per ton, some first-class shipped having run as high as \$1,000. The company have also an excellent little mill of six stamps. It really consists of three two-stamp batteries, placed side by side. It is claimed by Mr. W. R. Hughes, the Superintendent, that it will crush as much ore as a 10-stamp battery as ordinarily rigged, its capacity being from 12 to 15 tons per day, which is attributed to the opportunity afforded for a treble discharge, saying nothing of the saving in the wear and tear of belts, pulleys and the gearing generally.

The Star S. M. Co.

A shaft has been sunk to the depth of 370 feet, at the foot of which the vein was cut at right angles by a short drift and a level run 80 feet in length, showing a width from wall to wall of 8 feet.

It is in a quartzite, the walls nearly perpendicular. The character of ore, ruby and antimonal silver, much like that of Austin, requiring to be roasted. As much as \$121,000 worth of ore has been worked in the neighborhood, running \$180 per ton.

Several carloads of first-class shipped averaged \$400. It is expected that work will soon be resumed, the Tehama mill having been recently removed from the Shell Creek range for the purpose of working the ore.

The Gray Eagle, adjoining, has a shaft 100 feet deep. The ore runs \$100 in silver, besides containing considerable gold. The Pine Nut, on the same ledge with the Ticup, averaged as per shipments \$379 per ton.

The Exchequer

Lies between the porphyry and quartzite, and is 4 feet in width at the depth of 240 feet. Ore works \$80 per ton, about 600 tons having been reduced the past year.

There are many mines here lying idle, principally for want of capital to work them. The Chance is said to have taken out from a shaft 100 feet deep as much as \$15,000 worth of ore.

The Baltic is represented to be from 25 to 30 feet in width, with large bodies of \$40 ore, some running high into the hundreds. Favorable mention was also made of the Wonder, the Victoria, the McGary, the Mayflower and a score or more of others.

The district was discovered about four years ago, since which it has shipped to San Francisco over \$600,000 in bullion—nearly every coach leaving carrying one or two bars, of which no mention is made, as there is no local paper to chronicle the fact.

It is said that the Ticup and Geneva mines have shipped \$100,000, and the Star as much as \$200,000.

The mines occupy two main mineral belts, running parallel and about one-half mile apart. The country rock, commencing on the east with the granite, is followed towards the west by porphyry, quartzite, slate and limestone, in the order named.

White Pine District

Is unusually quiet, only a few companies at work, and these engaged in running tunnels, or for the most part prospecting.

The Henry tunnel, on the eastern slope of Treasure hill, contemplates running 2,800 feet, and reaching a depth of 1,500 feet from surface. It is intended to cut all north and south veins in its course; among the number, the Phil Sheridan, which is said to be one of the finest prospects in the district.

There is also a very large tunneling enterprise in progress by an English company, known as the

Eberhardt and Aurora Mining Company.

They are sinking an incline on the mine, which lies on the southern slope of Treasure hill. It is now down 1,100 feet, and is intended to cut the Aurora ledges at its intersection with the tunnel—at a depth of 1,400 feet.

The tunnel will be 6,400 feet in length when completed, something upwards of 900 feet being already run. The full extent of ore body cannot be fully determined until further developments are made. The mines of the company are understood to lie wholly in the limestone. They yielded, for the year 1876, about \$63,000 per month in the gross.

North of the Eberhardt and Aurora mines come the Beecher South, the Beecher North, the Edgar, Silver Wave, O. H. Hidden Treasure, North Extension, and the East Sheboygan—all awaiting the result of developments that may be made by the English company.

The Hamilton Mill Company

Own, on the east slope of the hill, the Charter Oak, Pogonip Flat, the Othello and Pogonip North, represented to have ore that averages \$50 per ton, and yet they, like many other mines fully as valuable, if not more so, are, for some reason or other, permitted to lie idle.

The Jennie A. and Black Rock Mining Company, Superintended by W. M. Ford, are running an incline and tunnel on their mines, situated near the summit of White Pine mountain. They lie between the limestone and quartzite, and are, in places, from six to ten feet wide. The ore is galena and carbonate, valued at from \$80 to \$100 per ton, silver, and from 40% to 50% lead. Some good bodies have been passed through, the ore improving with depth, the greatest now reached being 140 feet.

The '76 mine, owned by Col. Tyson, of San Francisco, is on the west side of the same mountain. It has a four-foot breast of carbonate ore—silver, 35 to 80 oz.; lead, 45% to 55%.

The Stafford Mine.

Adjoining the Haggin & Lewis, is spoken of as one of the most promising prospects of the district. It milled to the amount of \$20,000 worth of ore last year, and has either on dump or in sight at least 1,000 tons. The incline is 50 feet on the vein; at present cross-cutting and blocking out ore.

On the west spur of Treasure hill there are quite a number of promising

Base Metal Mines,

Such as the Imperial, Fay, Whippoorwill, Charter Oak, Oden, Oh Jo, Coningsburg, the Oro, the Mineral Point, East and West, and the Compensation and Good Luck—all encouraging prospects, ores said to assay, on average, 75 oz. silver and 45% lead; yet nothing is at present doing, either from want of capital or a practical knowledge as to best mode of reducing the ores.

The Boston Mine,

Owned by James Reilly and J. T. Gilmer, who have secured a United States patent for the same, was formerly known as the Virginia. It was abandoned and relocated under the United States mining law of May 10th, 1872, and is bidding fair to become a very valuable prop-

erty. They are sinking a prospect shaft from tunnel level on the vein, encountering rich bunches of ore daily. The vein will be cross-cut at the depth of 50 feet, to develop a rich body of ore found in upper works, which is said to dip at an angle of 45° to the west. The present shaft is expected to open up a continuous body from the surface its entire projected depth of 225 feet.

Mineral Hill District, Eureka County,

The chief mines in this district are owned by the Mineral Hill silver mines company of London, and from the Superintendent, Mr. Daniel J. Bousfield, we learn the following particulars concerning the mines. Like most of eastern Nevada mines the deposits or veins of ore are found in a limestone formation. The ore in the mines of Mineral Hill as a general thing being found intimately associated with quartz and spar, contains considerable antimony, zinc and other base metals; the ore bodies as a rule dipping easterly at an angle of about 40 degrees, the vein extending regularly from north to south.

At the present time the company is extracting some high grade ore and will start up their 15-stamp mill as soon as they have sufficient on the dumps—which, judging from appearances, will be at no distant day. The last run of the mill, completed a few weeks since, was a very successful one, the ore averaging \$254 per ton.

We think that by a judicious expenditure of a small amount of capital in prospecting the mines to a greater depth, large paying bodies of ore might be discovered, and Mineral Hill would once more come to the front as one of the large bullion producers of the Pacific Coast, the "hill" so far having produced between two and three million dollars in silver bullion.

The Austin Co.'s Mine,

Lying south of the Mineral Hill Co.'s ground, is looked upon as one of the best claims on the hill. It has probably yielded to date \$400,000.

Others are working near the surface, taking out some very high grade ore, but usually in no large amounts. The 101, owned by Hulburd Bros. produces ore that runs \$1,000 and upwards per ton, while that of the Bonanza, on the same hill, has in some instances worked as high as \$1,500.

The locality of the mines shows evidence of considerable local disturbance on the surface.

The mines will in all probability become more defined and the ore more concentrated as greater depth is attained. The large quartzite dike that cuts the mountain in connection with the slate belt lying near the ore bodies may be regarded as so far favorable.

A. C. K.

Spanish Belt and Philadelphia or Belmont Mining Districts.

EDITORS PRESS:—On the eastern slope of the Smoky Valley range of mountains in Nye county, about 80 miles southeast of Austin, the pleasant and prosperous capital of Lander county, are located the two well known mining centers whose names form the caption of this article. They are easily approached from the Central Pacific by stage from Battle Mountain, and by both stage and rail from the Palisade station via Eureka. The Battle Mountain route leads directly through Austin and Smoky valley in the Reese River mining region. This vast extent of country derives its name from a small stream called Reese river, which flows from the south to the north through the valley which borders the western base of the mountains. The extreme length of this mountain stream—which can hardly be dignified by the name of river—is about 150 miles. It is a tributary of the more pretentious Humboldt, into which it is supposed to empty, but it usually sinks, and is, the same as are all the sage brush streams, lost in the parched sands before it reaches that swift-flowing stream.

Eastern Nevada,

Which is now tolerably well explored, but not so well prospected, is that portion of the State lying south of the Humboldt river and extending to the Colorado and east of the line of the 41st Washington meridian. It comprises a trifle more than half of the State, and is well known to be rich in minerals. In topographical appearance it presents a succession of parallel ridges of mountain and valley, whose axial lines extend quite regularly toward some point of the opposing polar circles. This affinity of polar strikes is a noticeable feature of not only the great mountain chains and valleys of Nevada, but is also a distinguishing feature of its numerous venous formations, great fissures and mineral-bearing lodes, and even of the structure and cleavage fractures of its rock formations.

Spanish Belt

District, wherein are located those two promising properties owned by the Consolidated and South Barcelona companies, was discovered by a party of Mexicans as early as 1867. It adjoins and is distant from Belmont or Philadelphia district about eight miles in a south-westerly direction. The two Barcelonas, the Spanish Belt, San Pedro and other mines are located on a slate formation about six miles

MECHANICAL PROGRESS.

Suggestion for Iron Planers.

Prof. Sweet, of the Cornell University mechanical school, is making a thorough study of the metal planer, and has introduced several features which will increase its efficiency. Among others we notice one which he describes in the *Polytechnic Review* as follows: It is in regard to the proper time to feed the tool to the work. The fact is indisputable, that the tool should not be fed along while the machine is taking the cut, but it may be fed while it is going back, just as it starts back, or just as it starts forward. This latter is considered by others to be the best time, because the tool may run back in the track it has just made.

If a machine be absolutely rigid, there must be friction on the tool as it returns; if the machine springs, there is more; in either case the tool following back in the channel made must be worn away in exactly the part that does the work; besides, the part worn away is exactly square on the end. Now, my plan, which is to feed when the machine starts back, throws the tool on the uncut surface and wears the tool in a somewhat different place. Besides, the point of the tool coming in contact with the higher surface tilts the tool box and throws the tool at quite an angle from the vertical, so that the portion of the tool worn away is worn at an angle, and thus gives clearance to the cutting edge.

There is another feature about the planing machine with which I am not satisfied: In the ordinary method of arranging the feed so as to change the throw and also the direction, it is done by changing a stud in the slotted disc, so that changing the stud nearer to, or farther from, the centre of the disc gives greater or less travel to the feed rod. If it be desirable to change the direction of the feed, it is necessary not only to reverse the pawl but also to stop the planer and shift the stud to the opposite end of the slot. In point of fact this stopping the machine in order to change the pin to the opposite end is so much bother that it is not done once in ten times. We ought to be able to change the throw without stopping the planer at all; besides, in whichever way the pawl is turned the feed ought to take place at the commencement of the back stroke.

Encouragement for Inventors.

We agree with the *Western Manufacturer* when it says that it knows of no one who is better entitled to the name "public benefactor" than the man who by his intelligence and inventive genius has perfected new labor-saving machinery, and thereby created new forms of industrial labor, and so increased the capacities of production in any given direction as to furnish numberless conveniences and necessities, and luxuries even, at such low rates that the masses may enjoy what otherwise would be confined to the wealthy few. Such a man preeminently is Dr. C. O. Crosby, of New Haven, Conn., who has recently perfected a machine for automatic production of steel pens, which produces perfect pens at the rate of 150 per minute, or 90,000 per day. The *Hartford*, (Conn.) *Times*, referring to the above, says: "This item of news recalls some other incidents in the life of Dr. Crosby, which appear to be worthy of notice, as they show him to be a remarkable inventor in the number as well as the ingenuity of his productions. Dr. Crosby is a native of Hartford, and is about sixty years old. He has had a varied experience, having worked on a canal, in a printing office, a woolen factory, as a clerk in a store, as a silversmith, has been an actor, a merchant, a dentist and an inventor. One of his inventions is a machine for making fish-hooks, that makes over one hundred finished fish-hooks per minute, and so cheaply that they can be exported and sold in England at fifteen per cent. less than they can be made for in that country. Another is the needle machine, which has almost revolutionized the manufacture of needles. Accompanying this machine is another of his inventions for counting and putting the needles into papers. A machine for making and sticking pins, a ruffle and tape-trimming machine, and one for sewing boots are among the number of the inventions of this remarkable man, who has been one of the best customers of the patent office, his letters patent numbering about one hundred and fifty."

TRANSMISSION OF POWER BY SHAFTS AND ROPES.—The power lost by transmission from the prime motor to distant work is a matter of great importance. Our readers will be interested to know that the advocacy of ropes for transmission, to which we have formerly alluded in these columns, is still maintained. At the recent meeting of the English Society of Engineers, Mr. H. Robinson read a paper in which the following points were made: As regarded the transmission of power by shafting, etc., the results of several experiments and calculations showed the loss to be from 32 to 37 per cent. The application of ropes as a means of transmitting power at Oberusel, near Frankfurt-on-the-Main, at Logelbach, in Alsace, at Schaffhausen-on-the-Rhine, and at Fribourg-on-the-Saane, was next described. The loss of power by transmission by a single wire-ropes was estimated to be about six per cent. It has been stated that the cost of ropes was only one-fifteenth that

of an equivalent amount of belting, and only one-twentieth that of shafting. The wear and tear of ropes, together with the necessity of avoiding steep inclinations where the distances were long, lessened the advantages of that system. On the other hand, the loss of power in transmission by ropes, varied only as the velocity, whereas either by compressed air, or by water, the loss due to friction increased as the square of the velocity. The application of rope gearing to transmit the power from the prime mover to machinery in a factory, in substitution of toothed gearing, was also mentioned.

American Manufacturing Progress.

The most practical evidence of the progress of American manufactures is found in the way in which we are supplanting the English in the markets which hitherto they have controlled. Of our progress in the Russian trade in agricultural implements we have lately made mention. The testimony of our advance does not come from our own side of the water, but from the English, who certainly would not exaggerate the matter on our side. The last received issue of the *Colliery Guardian* says: "It is within our knowledge that the Americans are supplying agricultural implements as well as edge tools and general hardware to Australia and New Zealand; and the information is this week that they have succeeded in devising a light plow, which even the Caffir farmer has taken up, yoking it, as he now is, to a pair of oxen, to the displacement of the time-honored mamootie, which the Caffir laborer has for so many years made to do, in his own hands, the work of the spade and the plow. The American has just entered the Cape market; but once in, he has a faculty for remaining, and there is reason to conclude that in all the four great foreign markets we have indicated, he is likely to make his implements and his hardware increasingly popular, and he is beginning to sell new world hardware, as well as plows, to our fellow subjects at the Cape. The last mail thence contained the ominous requirement that a certain valuable consignment of miscellaneous hardware requisites, before bought only from firms in England, should be made up wholly in America, though the merchant to whom the order was sent has his warehouse in the heart of the hardware industries of our Midland counties."

CHEAP ELECTRIC LIGHT AND POWER.—We find in a recent lecture before the Bristol mining school the following paragraphs: The electric light apparatus has been so far perfected by Messrs. Siemens Brothers that I feel sure we can illuminate our colliery surface by night much cheaper by this means than by any other method. It can be seen working at Messrs. Siemens's works, Charlton, daily, and in a short time one of the donkey engines which is now lying idle at night will be the force employed to illuminate the pit banks at Trafaigar colliery instead of three and one-half tons of coal.

I am now making some large batteries out of our old used-up iron tubs and tar casks, and the waste ammoniacal water from the gas works, and some hematite iron ore, to drive a magneto machine for pumping water out of the workings at a distance from bottom of shaft. I have a small electric engine constructed on purpose; the battery on the table the size of a quart pot, made in the same way, will heat one-half inch of platinum wire red hot. The residue of the battery is the purest of iron, perfectly free from carbon, and made direct from the iron ore without smelting. A method of preparing iron I am not going to lose sight of; and perhaps of some commercial importance in the future if we can make our old tubs act as furnaces, and get a motive and illuminating power at the same time we are making pure iron.

UNLOADING GRAIN CARS.—An improvement in discharging grain from cars has been patented by Mr. Eugene Davis, of Clinton, Ill. A section of elevated track, of a car's length, reached by incline approaches, is suspended on an axle, and worked by aid of a cogged wheel and ratchet, by means of which the car can easily be inclined so that the grain runs under a sliding door at the end into a trough leading to the elevator or to a car on the adjoining track. The platform on which the car stands is so easily adjusted, that it almost moves automatically, and so rapid is its operation that it is stated by experts that 200 cars can be unloaded in a day with the assistance of four men.

REMOVING SCALE FROM BOILER TUBES.—Mr. S. S. Pilson, Master Mechanic of the Louisville, Cincinnati and Lexington road, removes scales from boiler tubes by placing them in a furnace. The heat loosens the scale and causes it to fall off, besides annealing and restoring the tubes. They are straightened by being placed while hot on an iron rod and hit, where needed, with a hammer. Mr. P. has also invented an attachment for grain-car doors, which excludes dust and rain, and also serves to seal and lock the car.—*Nat. Car Builder*.

IMMENSE CABLE.—The *Polytechnic Review* learns that Messrs. Kay, McKnight & Co., of Pittsburg, have recently furnished the Economy Society with a Manila drilling cable 3,000 feet long, weighing 3,600 pounds. This was purchased to finish the gas well which the society is now drilling at Beaver Falls, now down about 1,800 feet, and is said to be the largest hawser laid cable, without splice, ever made in this country. It was manufactured by Messrs. Henry Lawrence & Sons, of New York.

SCIENTIFIC PROGRESS.

Soils and Geology.

We notice that a Scotch geologist has been taking the scientific societies to task for bestowing so much attention to sea bottoms and losing sight of the soils which cover the surface rocks. In the report of a late meeting of the Edinburgh Geological Society we read a lecture by Mr. Melvin, in which he makes the following points on the importance of the soil as a theme for geologic research. What was wanted was, in his opinion, a minute and careful description of these soils and sub-soils, and of the materials of which they were composed, distinguishing the sources of the various mineral constituents, and the rocks from which they had been derived, as well as the nature of the vegetable and animal remains found in them. The agricultural maps of M. Delesse of Paris, were described and commended, and the hope expressed that the British Geological Surveys would not confine themselves to studying and mapping the bowels of the earth. Explaining that he meant by the surface soil that thin upper covering which, wherever vegetation existed, enveloped everything, and was the material worked on by the agriculturist, Mr. Melvin went on to point out that while the vegetable soil owed its origin chiefly to the growth of vegetation and insects, it afforded proof of a provision in nature for counterbalancing the destructive effects of atmospheric agents, the growth of plants and insects, and their death and decay, forming a soil whereon other plants and insects could grow with increased vigor. The earth could not otherwise, he thought, be what it was, as frost and heat and rain and wind would so act on its surface that it would become either a sandy desert or an arid wilderness. He then argued at length that the surface soil or mold was the product of vegetation and insect life, and it was steadily increasing; that it was the great preserver of the surface strata from disintegration and denudation; that the waste of the land was chiefly from the sides and bottoms of runs, streams, or rivers, while the great surface of the country, covered with vegetable soil, lost comparatively little—a position which, it was explained, was at variance with the views of Hutton and Playfair. Such able writers as Professor Geikie, who advocated the Huttonian theory and the uniformity of all geological phenomena, had never, it was remarked, shown how the vegetable soil or mold had attained its present thickness. Admitting that the soils were made up of boulder clay and other deposits, which formed the mother soil of most countries he was acquainted with, this did not account for the manner in which the soils had been formed. The fallacy of the views entertained by the writers referred to, was that, while they admitted the existence of a covering of vegetable soil by mold, they denied that it increased. The facts, in his opinion, showed that, at one time, the surface of the country had no covering of surface soil, but that, as vegetation spread, a soil began to form on its decay, being fed by successive coverings, and that this soil had continued to increase, and was still increasing, wherever it was not deprived of the decayed produce of its growth by the hand of man. He pointed out that the finest and deepest soil in Australia lay on an elevated tract in the interior of Queensland, and not along the coast where, were the Huttonian views correct, the action of water would be expected to have carried it. The soil along the Australian coast was generally not deep. In conclusion, he stated that the soil was similar in depth, and possessed an equal power of producing vegetation or insect life in both hemispheres, and argued from this point that the same causes had produced the soil in both cases, and that age corresponded in a like degree.

GOLD METALLURGY BY THE WET PROCESS.—In reducing pyritous gold ores, J. O. Stewart has found a curious chemical change which is not noted in the books, and which we shall state briefly. The ore was a lot of 20 tons from Gilpin county, containing two and one-half oz. gold, and 3% copper per ton, and carrying about 15% quartz. Part was roasted with the addition of 3% of sulphate of soda, and the rest by itself, all without salt, and then passed through the Hunt & Douglas process. Mr. Stewart supposed that after roasting the gold would appear in a metallic state, contaminated only with the sulphates of copper and iron, and was surprised to find that only 10% to 40% of the gold would amalgamate in the pans. Upon investigation he discovered that 60% to 90% of the gold was held in solution in the liquor as a chloride. This he precipitated with metallic copper, and was pleased to note that by the combined bath and pans he had made a saving of 95% of gold. The copper contained in the ore was worked up to 98%, and we give below its chemical condition produced in the process of reduction: Ore roasted without sulphate of soda showed of the copper 40% as sulphate, 59% as oxide, and 1% as sulphide. Ore roasted with sulphate of soda showed 60% as sulphate, 39% as oxide and 1% as sulphide. This test shows that gold is soluble in a solution of salt, iron and copper heated to 180° Fah., and is one of many experiments which have proved the advantages to be gained by using the Hunt & Douglas process on ores containing gold, silver and copper.—*Colorado Miner*.

Influence of Forests on Climate.

This is a question on which authorities disagree. It is, however, one of immense importance to dwellers in many parts of this State. We find in the *Journal of Chemistry* the following statement:

Many rivers have totally disappeared or have been reduced to mere streams by an irrational and heinous felling of the forests. In the north-east of Germany, the Narp and Gold rivers exist only in name. The classic lands of antiquity are rich in sad lessons of deforestation. The springs and brooks of Palestine are dry, and the fruitfulness of the land has disappeared. The Jordan is four feet lower than it was in the New Testament days. Greece and Spain suffer severely to this day from the effects of destroying their forests. Many parts of the kingdom of Wurtemberg have been rendered almost barren by the felling of the trees. In Hungary the periodically returning drouth is universally attributed to the extermination of the forest. We attribute the present unfruitfulness of Asia Minor and Greece to the destruction of the woods; steppes, ruins, and tombs have taken the place of what was the highest culture. Sardinia and Sicily were once the granaries of Italy, but have long since lost the fruitfulness sung of by the ancient poets. On the other hand, man can improve the condition of the land in which he lives, more slowly indeed, but as certainly, by cultivating and preserving the forests. In earlier years, reliable authorities have told us that in the delta of Upper Egypt there were only five or six days of rain in the year, but that, since the time when Mehemet Ali caused some 20,000,000 trees to be planted, the number of days of rain in the year has increased to 45 or 46. The Suez canal has produced remarkable results. Ismailia is built on what was a sandy desert, but since the ground has become saturated with canal water, trees, bushes and other plants have sprung up as if by magic, and with the reappearance of the vegetation the climate was changed. Four or five years ago rain was unknown in those regions, while from May, 1868, to May, 1869, fourteen days of rain were recorded, and once such a rain storm that the natives looked upon it as a supernatural event.

NAPHTHA WELLS IN RUSSIA.—A few miles from the town of Bakou, in the Caucasus, are situated the naphtha wells of that district. For hundreds of years naphtha has been extracted by the natives of this locality, and the quantity underground appears to be unlimited. A well 81 feet deep is shown to the visitor which was dug 200 years ago by the Persians when they were masters of the country. In summer, when gases are generated in the bowels of the earth, the naphtha is thrown up in jets, some reaching 100 feet in height above the ground, and then runs to waste in the absence of means to collect such large quantities of this oil. Mr. Churchill, the British Consul at Resht, Persia, reports that while at Bakou last year on the way to his post, he visited the wells on the neighboring plateau of Balakhana. He says that in 1874 the tax of 25c per pood (36 lbs.) of petroleum brought the government 280,000r., showing a production of 1,120,000 poods of petroleum, and a consumption of three times that amount of naphtha. In that year upwards of 180 manufactories were at work in the outskirts of Bakou, but, owing to the enormous competition of American petroleum, many of the smaller manufactories have been compelled to shut up. The two largest are at Surakh Khana, eight versts from Balakhana. This spot was chosen for economy of fuel, as gas issuing out of the surface is used in lieu of coal or naphtha. You have at Surakh Khana the wonderful sight of green fields and waving corn, in the midst of which removal of a foot or two of earth will reveal a jet of gas that will raise an enormous blaze if set on fire. It is here that the Hindoo monastery of fire-worshippers is established, where a tongue of flame is perpetually kept up.

LABORATORY MANIPULATIONS.—Dr. P. T. Austen, of the New York Academy of Sciences, says the following apparently unimportant details often contribute much to the ease and pleasure of working: (1) The use of square pieces of felt, such as are used under beer glasses in saloons, for setting hot beakers and flasks on to prevent chilling and consequent cracking. (2) In crystallizing substances for examination under the microscope, one watch glass is placed upon another with the substance between them, and the upper glass filled with ether, the cold produced by its evaporation hastening the crystallization. (3) Removing precipitates and solid matter from flasks, by heating to boiling and inverting in a vessel of water. (4) Crystallization by gradual dilution. (5) Filtering water without ash. In German laboratories it is customary to dissolve out the mineral matter from white filtering paper by washing in dilute hydrochloric and hydrofluoric acids. (6) The use of infusorial silica for drying purposes. Being very porous, it will absorb five times its own volume of water. If a filter paper, holding a wet precipitate, be placed upon a layer of this earth, it will become quite dry in a very short space of time. Mr. Austen also remarked that substances retain their heat for several days when placed in cork boxes. To keep a substance air-tight, it may be placed in a flask, the neck painted with a solution of india rubber in chloroform, and a plate of glass laid upon it. The solvent quickly evaporates, leaving a delicate film of rubber, which holds the glass tightly in place.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

ANOTHER ALPINE BONANZA.—*Alpine Chronicle*, April 14: It is gratifying to us to be enabled to announce another instance of the wisdom of changing the system of mining in this county, the tunnel having been generally discarded for the shaft. The sinking of shafts have made the Excelsior and I. X. L. at Silver Mountain, paying mines, and we have now to chronicle an important strike in the Advance mine, at Monitor. The west drift of the advance at the 320-ft level, running toward the prospecting shaft of ledge 3, has penetrated ledge two 70 feet and not yet reached the foot wall. The hanging wall of this ledge is well defined—course north, 16° east, dipping east at an angle of 42°. Several feet of rich ore is found on the hanging wall; and the entire ground through which the drift has passed in this ledge is fine vein matter, thoroughly impregnated with mineral, and giving good assays in silver and gold. Increasing in value as the vein is approached. The northerly drift on this level is running outside of and parallel to ledge 2, all in pay rock, including some very rich quartz feeders. No cross-cutting has been done in this drift yet, but the course of the several feeders it penetrates indicates that this pay belt extends considerably beyond the limits of the drift. Work in the mine at present is confined to cross-cutting No. 2 ledge and preparing the ground by drifts for extracting a supply of ore for the mill as soon as it can be made ready to start; but work on the shaft will soon be resumed and drifts run at lower levels.

The Advance Co. commenced operation about eighteen months ago, and they have fine hoisting works and a three compartment shaft.

AMADOR.

YONK'S PLACER CLAIM.—*Amador Ledger*, April 14: Cleaning up is in order at Yonk's claim at Butte. The prospects indicate that it will pan out big. The Hinkley mine, of Jackson, has been idle for over twelve months. In consequence of the owner not possessing funds to prosecute development. It seems to be the prevalent idea that the mine is pockety, with no well defined ore chamber or ledge. This is incorrect. The opinion of those best acquainted with the property is that it constitutes a regular chimney of quartz. So far as opened the mine has paid from the very start, the rock being of high grade, every ton of it yielding handsomely at the mill. The shaft is down nearly 100 feet, the ledge continuing all the way. About this point, however, the ledge appeared broken, apparently by some disturbance subsequent to its formation. To follow it, drifting became necessary, which was pushed forward, until the sinking of a new shaft became absolutely necessary. Then came the sticking point. The owner had not the means to make the putting down a second shaft, and so work was suspended. The hole in the ground is not a very large one, but it has surrendered for \$13,000 to \$20,000. We are glad to learn that there is a prospect of speedy resumption of work.

COMET.—Gratifying intelligence reaches us concerning operations on this mine, lately purchased by John A. Starr. On Wednesday last a very rich body of quartz was struck.

NICHOLS'S GRAVEL CLAIM.—A tunnel has been run into the mountain a distance of 30 feet, passing through a seam of gold-bearing gravel, eight feet thick. Some idea of the richness of the bed may be gathered from the fact that pans of picked dirt have yielded as much as \$14 to the pan. The owners are happy in the anticipation of a golden harvest in the near future. The gold is of a coarse grain, indicating that it is present in considerable quantities. It has been the impression with many experienced miners that Butte mountain was pregnant with gold, and now that a large streak of pay dirt has been discovered, it is probable that other prospectors will be stimulated to tunnel into its rugged sides in search of hidden treasures.

The Volunteer mill is being removed to the Beck mine. This small mill is intended more for prospecting to test the quality of rock at Spanish gulch than anything else. A CLAY-UP of the rock from the Griesbach mine, at Mace's mill, last week, realized \$3,000 from about 100 tons of rock.

The Volcano tunnel is in 550 feet—just one-fourth the entire distance. The rock is not quite so hard as that encountered lately.

We learn that Mace's mill is now engaged crushing rock from Stoken's claim.

CALAVERAS.

EMERSON HYDRAULIC.—*Calaveras Chronicle*, April 14: Piping progressing steadily in the Emerson hydraulic, in Happy valley. A large area of gravel has been put through the flume since the last clean-up, and a good deal more will go the same way before the water falls.

DURYEA MINE.—Everything is progressing very favorably at the Duryea mine, in Chile gulch, and work is being pushed forward with all the energy of the season. Twenty-nine men are employed in and about the mine, operations progressing day and night. The battery is kept in constant motion, with very satisfactory results.

MOUNT TOLU.—Work has been resumed with increased vigor in the Mount Tolu quartz mine. The battery is running, no difficulty being experienced in mining rock sufficient to keep the stamps constantly employed.

GOVERNOR CLARK.—The Hon. Mr. Clark, proprietor of the Consolidated hydraulic claim, on Tunnel ridge, cleaned up lately, after a short run on "top dirt," no bedrock having been uncovered during the washing. The yield was in the neighborhood of 100 ounces—good returns, certainly, for the time consumed in piping and the number of hands employed.

COOK & CO.—In the hydraulic claim of Cook & Co., on the Calaveras, about five acres of top dirt have been stripped off, and everything is in readiness for piping up the bottom. As the gravel on and near the ledge is very rich, the company cannot fail of realizing a large amount at their next clean-up. Water is getting a little scarce.

MINING ITEMS FROM THE UPPER COUNTRY.—At West Point stopping still continues in the Champion. Rock from that mine is still being crushed, and the mill will probably be running in motion a couple of weeks longer. The Granite mine has been bonded to the Josephine company, and the machinery now on the latter mine is to be moved to the former. The machinery for the new mill on the Zacetero will all be on the ground next week. At Mosquito, Garland's mill has just completed crushing several lots of custom rock. Twenty-eight tons from Gass & Co.'s mine yielded \$34 per ton—a very handsome average. The ledge is a wide one. Eleven tons from the Blue Jay, owned by Potter & Rodgers, paid \$32 per ton. A new pump is to be put into the Champion mine, at Railroad. All the mills in the upper districts are now running, and times are livelier than they have been for years.

FRESNO.

CONFIDENCE.—*Fresno Expositor*, April 12: We learn that the Confidence quartz mine is about to be started up under more favorable auspices than ever before. The company will immediately erect a mill to be run by water power, for the purpose of crushing the ore from the mine. The work of developing the mine will also be pushed vigorously ahead. The services of an efficient mining Superintendent have been engaged.

INYO.

MACHINERY ARRIVED.—*Inyo Independent*, April 14: Considerable new machinery is to be put in the Rex Montis mill; among the rest, quite a heavy boiler to furnish steam for the pans, which was sent up to the mill two or three days since.

MINING EXCITEMENT.—Quite an excitement is said to have been created last week by the discovery of a large ledge of unusually rich quartz, located near the summit of the lofty peak in the Inyo range, nearly opposite Alabama hills. From accounts there is good reason to believe the reported discovery will prove of material importance, but we are not in possession of data sufficient to warrant a statement in detail.

STARTED UP.—*Conso Mining News*, April 14: The Minnetta mill was to have been started up yesterday or to-day. We presume it is now pouring out the silver. A large lot of very high grade ore awaits its turn for crushing; among others a Mr. Higgins has five tons on the mill dump, taken from a new find, which assays nearly \$500 per ton silver.

LOOKOUT.—Thos. C. James, foreman of the Modoc, says the Modoc never looked so well. Within the last week the ore bodies have increased to such an extent in the different districts that the company has been enabled to make more than supply both furnaces by disposing with the services of seven workmen. It is thought that the raise to connect No. 3 with No. 4 is within 10 or 12 feet of completion, and when that is done he can keep both furnaces supplied with ore and further dispense with 10 or 12 men. The bullion now being turned out averages over \$800 per ton.

The Defiance furnaces, which have been running since the 13th of March, were compelled to shut down last evening in consequence of a non-supply of ore, the work of running the cross-drift from the main hoisting shaft to the second ledge consuming more time for its completion than was anticipated. This cross-drift is for the purpose of facilitating the hoisting of the ore by the steam works, instead of handling some over two or three times at great expense. When this connection is made, which will probably require a week or two longer, ore can be taken out in sufficient quantity to satisfy the insatiable appetite of the two furnaces.

THE GOLD MILL.—The three-stamp gold mill of J. F. Trapp got up steam last Wednesday, and is now pounding away on ore that is believed will yield a handsome return on the money invested. If this mill succeeds, it will prove to be the entering wedge to more extensive works, not only in Old Conso but also in Snow & Grant's canyon, where there are numerous ledges, the ore from which works by arrastra over \$100 per ton.

EMIGRANT CO.'S MINES.—We took a trip to Lee district last Sunday. Although there were few signs of life at this camp, which but a short time ago was all bustle and activity, we found the mines there with piles of rich rock upon the dumps of the Emigrant company, and only waiting the expenditure of a little gold or gold notes to extract the silver and gold contained therein. This state of affairs, we are assured by Mr. Peter Taylor, the Superintendent, will not last much longer, as arrangements have been made to resume work. He went out last Tuesday and put a few men to work upon the mines, and in a few days he expects to receive orders from the Directors to start up the mill. During the interim of running through the old tailings and a few tons of the rich ore, a force of men will be sent to the mines to begin work upon the completion of which the mill will be removed from its present site to the mines, where the ore can be worked much more profitably and to a greater advantage.

NEVADA.

CASSIDY MINE.—*Grass Valley Union*, April 15: We were shown, yesterday, some fine ore which had just been taken out of the Cassidy mine, at a depth of 48 feet. The ore is very heavy and shows free gold and a great abundance of sulphur. The quartz has a very lively appearance. The Cassidy mine is on Opp Hill, a little east of the old and celebrated Empire mine. The Empire and Cassidy ledges are parallel. The prospects of the latter for resulting in a fine mining property are splendid. The ledge is about twenty inches thick where the good ore is now coming out. Some recent mill tests show that the rock will yield over fifty dollars to the ton.

CALIFORNIA.—*San Juan Times*, April 14: The American mine, at Sebastopol, cleaned up a portion of their boxes this week. Only a few of their head boxes were cleaned up, and yet the yield was much greater than they anticipated. At the close of another 30 days they will clean up their entire boxes from head to foot, including their under currents. They are now washing very rich ground.

RIVER MINING.—*Foot-hill Tidings*, April 14: River mining is still attracting a large share of attention here and in Sacramento. The pioneer organization for opening up the wonderful gold deposits known to exist in the beds of the various rivers flowing from the mountains in California—known, because worked in spots before the filling up of the rivers prevented "stripping" any more—was the Yuba River Mining Co. This company are down with their shafts near the point where the river will be run under the river and it cannot be long ere the results of the venture will be known. The rock became harder last week, impeding progress, or the drift would now be well under way. This change in the rock it is thought indicates the permanent bed of the river, and as no water seems to come in from the river side yet the feelings of stockholders are well up. So also are those of owners of other claims along the river, who are waiting for the word to start the "Long Bar" and the "Sand Flat," each of which have much promise in their mines, have been incorporated this week. As we predicted some weeks ago, so we reiterate now: river mining is destined to be the exciting and also the paying field of venture for the next few years. Fifty years will not see the river beds worked out as to their bed-rock deposits, and when these are worked out the gravel and slum deposits above will pay for hundreds of years more.

PLACER.

BLAST.—*Dutch Flat Forum*, April 13: The Baker claim exploded its second blast in solid gravel yesterday; 4,000 lbs. of dynamite were used in this blast, which resulted in excellent execution, loosening a large amount of gravel and exceeding the expectation of the most sanguine. As expected, the shaft was plugged, which will require several days to open.

The Star and Union is running well and washing in very rich gravel. The next clean up from this claim is looked for with considerable interest, as it will probably be one of the largest ever made in this district.

The Polar Star exploded a blast of 250 kegs of black powder on Saturday last. The drifts were run on the bed-rock and the effect was wonderful. The incline was partially plugged, but has since been cleared. Sufficient gravel was loosened to keep the claim in dirt for some time to come. This claim and the Southern Cross are washing as steadily as possible.

The Pacific is at cleaning up. There remains only one run down, when this claim will be exhausted on present level.

The Elmore Hill claim has let off three small blasts since our last. It is now washing again and is doing well. At Gold Run the Cedar and Bonanza claims continue washing, neither being ready to clean up yet.

The North Star and Illinois continue washing, and will probably run as long as the water lasts.

BEAR RIVER.—The Centennial and Crissman Co.'s mines, will be connected by means of a tunnel in a few days, and when accomplished, both mines will be worked through the same shaft or incline.

The Whipple mine still continues to pay well.

SHADY RUN.—Hydraulic progresses in the Wild Yankee, the mine is looking well, and it is thought will pay a dividend in a short time.

YOU BET.—The Nece & West and Walopla companies, under the superintendency of G. W. Powers, continue to wash with unabated success.

The Nevada M. Co., or better known as the Hayward claim, continues to wash from three points, all of which are making a good showing.

LIBERTY HILL.—As there is still an abundance of water the Liberty Hill Co. continue making splendid progress in hydraulic.

LITTLE YORK.—The Empire and Christian Hill Cos., continue to wash with full heads of water. The mines are looking well.

PLUMAS.

ANOTHER BIG CHUNK.—*Plumas National*, April 14: Edman & Co., on Eagle gulch, have certainly struck the "coarse gold streak," having found three big pieces in the last few weeks. The first weighed 43 ounces; the second, which we mentioned a week or so ago, 17 ounces, and now we learn that they picked up a chunk on the last which came up to 27 ounces. They came near losing the last piece, as it went through the upper flume and "grizzled," and half way through the lower flume before it lodged. Besides the big nuggets the claim is paying first-rate, and our friend Edman will be a "bloated bondholder" soon. Well, he and his partner have worked faithfully to open their claims, and certainly deserve their success. We hope the big "chunks" will continue to come, and increase in size as regularly as the three above spoken of.

THE BELL MINE.—Mr. R. Z. Bell, of the Bell company, arrived from Dubuque, Iowa, on Wednesday. The company have purchased all the necessary machinery for a new quartz mill, which is on the road, and will be at the mine by the time it can be used. Ten stamps will be started in first, and more will be added when necessary. The work will be pushed forward as rapidly as possible.

GOOD PROSPECTS.—Mr. A. Bolyar has during the past winter been running a prospect tunnel for drift diggings above Spanish ranch, his claim joining Garland's lava bed claims, and recently he struck splendid pay ground. This is encouraging, as Abe has worked hard to get at it, and besides the strike makes the chances of other prospect claims in that vicinity better.

IMPORTANT SALE.—Greenville correspondent, writing under date of the 11th inst., informs us that Messrs. Lawrence & Reed have purchased from John Ellis and Jack Lowery, the ledge recently discovered at the head of Soda creek, by Ellis, and known as the Washington mine, for the sum of \$20,000. Our correspondent says the experts, or, as he has called them, "bonanza sharps," consider this discovery the biggest strike ever made in that section. The strike will stimulate quartz prospecting all over the country. Many a ledge as good is to be found by a little patient labor, and with such chances it is well worth while to make an effort to find them. We are satisfied that the gentlemen who made the purchase will develop a very valuable mine, as they are too well posted on mines to pay that price for a poor prospect.

SIERRA.

AMERICAN HILL.—*Mountain Messenger*, April 14: The American Hill gravel mining company are reported to be getting along nicely. They have run off a large amount of ground and the prospects for a good clean-up, considering the scarcity of water, are first-class.

GOOD.—The Bald Mountain company recently took out 130 ounces of gold after about 12 hours working in the smelter.

The North Fork company have only some 500 feet more of tunnel to run to open their mine.

KANAKA.—Al. Bixby has returned from San Francisco and will proceed to open a creek claim in Kanaka creek, below Allegheny. The ground he claims has never been worked on account of the difficulty of getting down.

ORO.—The Oro company, by a large majority, voted to build a mill, and to accept the proposition of J. D. Olin to erect the erection of the same. No contract has yet been signed.

MONTE CRISTO.—All the men here are busy just now—35 all told. The Exchange is paying well at present and bids fair to do better soon. D. E. Williams one of the owners, still assists and directs its workings. The Mountain Lava, Swallow, Poodle, Cold Springs, Bull Dog and Scott's claims are being worked, many of which are paying good wages. There is a chance of doing better in course of time. McBride and Spencil intend running for the back lead.

EUREKA.—All the miners here are idle, except at Moore & Walker's diggings, Mugginsville, which are being worked. A short water season anticipated, and consequent dull times.

TRINITY.

QUICKSILVER.—*Trinity Journal*, April 14: Mr. Lawrence, Superintendent of the Altos and Boston mines, in Chinatown district, was in town this week, and from him we learn that the mines under his supervision are yielding sufficient quicksilver to pay a handsome profit, even at the rate of 40 cents per pound; 420 flasks were procured last month, with the retorts now in operation. It is probable that furnaces will be erected before another season.

TUOLUMNE.

NOR WORKED OUT.—*Tuolumne Independent*, April 14: Last Saturday a Chinaman working a claim just south of the Catholic cemetery at Columbia, found a piece of quartz and gold valued at \$208.50. This claim has been worked and reworked and abandoned three or four times. The last while owner, selling it to the Chinamen for \$400. Everybody felt confident that the Celestials had been badly swindled; but such was not the case. Ever since their purchase they have been getting good pay, and this big lump will help to lengthen the white man's face. They go down in holes between boulders one would think hardly big enough for a rat; but John, with a patience and perseverance worthy of all imitation, manages to skin out the narrowest crevices and gopher the richest streaks. We like to see these poor devils come out ahead when some white Alec imagines that he has sold them.

FERGUSON.—The owners of this mine are in a happy frame of mind at recent developments. Messrs. Hall and Ferguson visited the property last week, and brought to Sonora some very fine specimens of ore, said to go for at least \$50 per ton. The company have driven the tunnel 1,500 feet and are 10 feet on the Anderson chute—the vein starting as a mere stringer one-quarter of an inch thick, has increased in this distance two feet—at this point gives the company 300 feet back. This is the chute that Mr. Richard Inch was trying to develop, when he was so unfortunately drowned in the Tuolumne river while attempting to cross.

Nevada.

WASHEO DISTRICT.

UTAH.—*Gold Hill News*, April 18: The west drift on the 1150-ft level is steadily advancing. The work in the mine is confined to this one drift for the present, every effort being made to reach and prospect the ore vein at that point at the very earliest moment possible.

BEST & BELCHER.—A streak of clay was passed through in cross-cut No. 3 on the 1700-ft level during the first part of the week, and the face of the drift is again in soft vein porphyry.

SOLID SILVER.—Since last week's report a cave has occurred in the main drift north, interfering with operations somewhat, but it is likely to prove more of an advantage than otherwise, for it brought down a large amount of quartz, some of the pieces of which weighed over a ton, giving excellent assays in gold.

BULLION.—The new engine is working splendidly. The north drift on the 1500-ft level is making good progress, with no important change to record.

CALADONIA.—Yesterday morning the engines were stopped and the work temporarily suspended to make some necessary repairs to the steam pipes and machinery. That work was completed and everything is running full blast.

SOUTH COMSTOCK.—Continued good progress is being made in sinking the shaft, and it is now down 160 feet below the 300-ft station. The material at the bottom is ledge porphyry, with streaks of clay and small veins of quartz which give good assays.

SILVER HILL.—The south drift on the 650-ft level is showing some very fine quartz. Both drifts are making an average of four feet per day.

CHOLLAR-POTOSI.—Daily yield, 100 tons of ore, the average assay value of which is \$26 per ton. The old ore stops on the upper levels exhibit no material change.

BELOCHER.—Opening up the 1850-ft level is going rapidly forward. Sinking the main incline is making the usual good progress.

LADY WASHINGTON.—The east drift on the 950-ft level

has cut some fine quartz and has every appearance of being on the point of penetrating the vein proper.

COX VIRGINIA.—Daily yield, 40 tons of ore; 150 tons of this ore is extracted from the 1550-ft level, and the remainder from the 1650-ft level. The ore stops are looking well and yielding splendid ore at all points. The ore breasts on the 1450-ft level are being gradually extended, both east and west and south, and will soon be sufficiently opened to allow of a large increase in the amount of ore extracted from that portion of the mine. If it is desirable to do it, the south drift on the 1650-ft level, running to connect with the deep winze, is in a distance of 135 feet, the face still in rich ore. This drift has about 60 feet to yet run to make the connection. The upraise from the 1550-ft level, to connect with the 1400-ft level, to assist in the working of the southwest ore body between those two levels, is being pushed steadily forward.

CALADONIA.—Daily yield, 500 tons of ore. There is little or no change in any of the ore stops on the 1550 or 1600-ft levels. The character of the ore extracted is still of the heretofore high grade, and the mills are kept busy crushing up to their fullest capacities. The prospects of the mine were never better than at the present time. The mills in better order for a long and successful bullion producing run. The north drift, running to connect with winze No. 3, is being pushed vigorously forward, the face still in porphyry. This drift is being run some distance east of the ore vein, and will have 70 or 80 feet to run to reach and connect with the winze. Sinking the C. & C. shaft is being pushed steadily forward, the bottom still in hard blasting rock, and the flow of water strong. It is believed that the shaft will have attained a depth sufficient to commence the opening of the 1700-ft station by the first of May next.

OVERMAN.—The east drift on the 1300-ft level has penetrated the vein a distance of 65 feet, the entire distance in fine quartz. At that point the drift has been temporarily suspended in order to permit of the starting of a drift to the southward in the vein, to see what lies in that direction. As soon as the south drift is fairly under way, work in the drift eastward will be resumed.

OPHIR.—Daily yield, 30 tons of ore. This ore is being extracted from the old ore stops on the 1600-ft level, and has an average assay value of about \$20 per ton. The Winfield mill commenced crushing ore again to-day. Sinking the main incline is being pushed forward with all possible speed, and will reach a depth sufficient, if nothing extraordinary happens, to begin the opening of the 1900-ft station by the first day of May next.

JULIA.—The south drift on the 1800-ft level is rapidly advancing, the face still in quartz of a fine character. The west cross-cut from the main drift has penetrated 70 feet of fine quartz and low-grade ore. The east cross-cut (No. 2) recently started, and which it was supposed would only have a few feet to run to reach the east wall, passed through 12 feet of low-grade ore, then encountered a broken mass of porphyry and quartz for a distance of 25 feet, after passing through which, it cut a thin clay slip, the entire face of the drift being again to-day in a very encouraging character of low-grade ore.

NORTH COX VIRGINIA.—Sinking the shaft is being pressed ahead with the usual vigor, the bottom in splendid working ground. It is now about down to the 1300-ft level. An electric battery has just been procured for firing the blasts at the bottom of the shaft. This method admits of much better progress. The holes for the charges of giant powder in the bottom of the shaft are each drilled five feet in depth, by the Burleigh drills, and are then exploded 21 at a time with the battery, making a fearful excavation at each discharge.

The face of the vein is covered in soft ledge porphyry, with streaks of clay and quartz, requiring constant and careful timbering in order to prevent caving. The powerful drilling machinery heretofore employed is not so much needed just now, consequently the force of men is somewhat decreased; but with the next hard stratum encountered comes an increase of the working force again to keep the drills in full operation. The tunnel is passing through the various strata of the vein, and is now in a position to be parallel with the great Comstock fissure, and will penetrate the main range itself in the early part of next year.

CROWN POINT.—The east drift on 2000-ft level is being pushed ahead with the usual vigor. The face of the drift is to all appearances rapidly nearing the ore vein. The porphyry is steadily softening, the flow of water in the face has increased to about six inches in some places, and small seams of quartz and clay are beginning to be encountered. From some of the stringers assays of \$5 to \$8 per ton has been obtained.

MEXICAN.—The upraise above the 1455-ft level recently started on the six-foot streak of ore developed at that point, is being steadily pushed ahead. This raise is ten feet square, the entire face now being in ore that gives average assays of from \$20 to \$25 per ton. The flow of water in the bottom of the new shaft has been very strong during the past week, but is again gradually slackening. The north winze, below the 2040-ft level, is being sunk at the rate of five feet per day, and has about seventy feet to go to reach the 2200-ft level.

JUSTICE.—Daily yield, 400 tons of ore, which is being crushed as fast as extracted. Two or three steps are looking well on the 600, 700 and 800-ft levels. The ore body on 700-ft level is opening out finely to the eastward and promises a fine yield from that portion of the mine. The south drift on the 1000-ft level is still developing fine ore. The incline will soon have reached a depth sufficient to begin the opening of the 1100-ft level.

BALTIMORE AND AMERICAN FLAT.—The northeast drift on the 1400-ft level is steadily advancing, the face in making good progress, and the flow of water gradually on the increase, with evident indications of a near approach to the ore vein.

GOULD & CURRY.—The south drift on the 1700-ft level, running to connect with the Combination Savage winze, is making steady progress. The east cross-cut from the drift during the first part of the week cut through a seam of clay, having the regular north and south course and east dip of the regular ore vein.

IMPERIAL COX.—The east drift on the 2000-ft level is steadily advancing, the face in very encouraging ledge material. An east cross-cut has been started near the middle of the mine, on the 2135-ft level, the face of which is also in a fine character of ledge material.

HALE & NOACKROSS.—The gain on the flow of water has been but very little during the past week. The water is being held by the pumps at a point 80 feet below the 1000-ft level.

ATLANTIC COX.—The tunnel is to-day in 33 feet, and the ore vein having widened out to 23 inches, with every indication of still further widening, the Superintendent has considered it best to commence stopping upward and take out the ore for milling, which is now being done.

GRAND.—The west prospecting drift on the 815-ft level is steadily advancing, the face in a fine character of quartz mixed with porphyry and spots of ore.

SIERRA NEVADA.—The diamond drills have been used to prospect the ground to the eastward, on the 1500-ft level, without finding anything yet that will pay.

SAVAGE.—The pumps make but slow headway against the water, which is now only about 20 feet below the 1900-ft level.

UNION COX.—The north drift on the 1300-ft level is making steady progress, the face in porphyry, mixed with streaks of quartz and clay.

LEVATHAN.—Face of main drift north at the 600-ft level still continues in quartz of a very promising character.

PROSPECT.—Face of drift in hard material. Good streaks of quartz, however, are met with, some of which give high assays, principally in silver.

PHIL SHERIDAN.—Work on the 1400-ft level has been temporarily suspended, pending some necessary changes in the machinery.

SUCOR.—Sinking the shaft is making the usual fair progress.

DARBANELL.—The timbering of the new three compartment working shaft being about completed, sinking will be pushed forward with renewed vigor.

Continued on page 252.

Continued from page 242.

long and from 500 to 900 feet broad. What are or were called the Wide West and the Ontario veins, were among the first discovered in the district. The former, which is said to have been opened by shaft to the depth of 50 or more feet, showed at this depth a vein 12 feet thick, which carried ore of a very fine character. The belt, whose altitude is several hundred feet above the subjacent plains and valleys, exhibits the

Unmistakable Characteristics

Which usually distinguish the rich mineral-bearing sections of this portion of the State. Both the elevation and the geological formation of this old but yet newest of new districts of southeastern Nevada are peculiarly favorable to the presence of rich and permanent ore deposits. The ore which the two Barcelona companies have thus far obtained from the surface, shaft and tunnel developments, have been of uniformly fine grade, carrying an admixture of chlorides, horn and ruby silver. At the time of my visit to this now promising locality, the joint tunnel had penetrated the hill several hundred feet on its course to the ledge. The work was being vigorously pushed ahead under the instructions of Superintendent Farrish, whom I was unable to see on account of his absence at Belmont on business. Had I met that gentleman it is not improbable that I would have succeeded in obtaining from him fuller and more accurate information regarding both the character of the explorations and the prospects met with while pursuing them, than I was able to collate from personal observation. At the entrance to the

Joint Tunnel,

Whose dimensions are, I have been informed, seven by seven feet, the visitor is brought face to face with a sign-board upon which is traced the significant legend, "No admittance." While this notice may not exactly specifically indicate the presence of ore in either this or other works where found, posted, it nevertheless is, in this instance, looked upon by miners here as good evidence that the inside developments are of so favorable a character that it will not at this juncture do to let the prying eyes of the outer world behold them. This is the view taken of it by the mining quid nuncs of Belmont at least, where it is currently reported and believed that ore of a superior quality had been found some weeks ago in a blind vein cut by the aforesaid tunnel. Be this as it may, it is very generally believed, and this belief has already exercised no small elevating influence upon the drooping spirits of the inhabitants of the vicinity. The next

Thirty or Forty

Days will, however, it is now presumable, relieve the doubts and suspense of all concerned and greatly enhance the value of the Consolidated and South Barcelona properties in your market. Should ore in paying quantities be struck in the tunnel, which is now pushed forward at the rate of from 35 to 45 feet per week, the partly dormant interests of this quarter of Nye county would, I hardly need say, receive from such discovery an impetus which would greatly benefit them, and lead to other undertakings which would help to develop the extensive mineral resources of a region that has hitherto been partly neglected. And that one and a ledge which will astonish many by their valuable and permanent attributes will soon be exhumed from amidst the superincumbent mass which cover them, I am at present, as are all who are acquainted with the locality, quite certain. No other conclusion could well be arrived at, and no other would be tenable or would do justice to the interests involved. The Barcelonas appear to be located on a true fissure of the contact order, the lode having slate on the hanging and porphyry on the foot-wall. A formation of this character, wherever found in Nevada, is invariably looked upon with confidence by the old and experienced miners and prospectors of the State. The reason of this confidence will appear obvious to the experienced miner and mineralogist, who always look for rich and enduring mines in such formations. True fissures extend to a profound depth, and their lateral expansions, as is the case of the Comstock, are also sometimes very great. They have, of course, their contractions, but they hardly ever resolve themselves into razor-like proportions by their walls coming close together. Faults and displacements they have, but they never become totally extinct in either longitudinal or downward trend. Silver mining is one of the most profitable and enduring of occupations, and without I am much mistaken, mining interests of this character will ultimately reward the enterprise of the Consolidated and South Barcelona companies.

Philadelphia,

Or Belmont mining district, of which I cannot write much at present for want of space, was prospected and incorporated in October, 1865. Colonel David Buel was the first to erect a mill there. It was a wet crusher and was completed in the latter part of September, 1866. But the ore having been reduced without roasting, not more than 50% of the silver was saved. But, notwithstanding this fact, the mill turned out \$100,000 in a little less than three months, with but 10 stamps, so high was the grade of the ore. The formation of the district is of slate and granite, the former, however, encasing the veins of the district, which are the Belmont and Highbridge fissures, which have thus far produced an aggregate of \$2,780,500 worth of bullion.

GOTHAM.

Tybo, Nevada, April 9th.

The Old Pioneer.

The following well written sketch of an old prospector and pioneer, which we take from the *Eureka Sentinel* of recent date, will be appreciated by our mining friends:

He was just getting ready for another trip, and was as enthusiastic in regard to the new El Dorado as when, 28 years ago, a roving disposition and love of adventure broke up the routine and started him in search of the golden fleece from the quiet New England life that, looking back on to-day, is sanctified in his memory. He was in the first flush of manhood then, and the little world that bounded the old homestead was circumscribed indeed, but it was all he knew; although faint rumors of fertile lands and boundless prairies in the unknown West had already unsettled his mind, and filled him with vague longings for a better field for the untiring industry that, up to that time, had been spent in a vain struggle with the granite soil and fierce elements of his native section. When the whisper of the far-off land first came laden with strange stories of wealth in the streams, and riches to be had for the trouble of gathering, he broke the ties that held him to the farm and bid adieu to the old folks with many a promise of a speedy return when he had accumulated a modest fortune, which, in the castles that he had built, was to be devoted to the comfort of their declining years. The voyage was a long and weary one, but the lapse of a few months found him among the earliest of the Argonauts. His castles were substantial structures, for his industry and frugal habits soon served him to gather the amount that was the goal of his ambition. In the lonely life that followed during his stay the little farm among the rocky hills had kept its influence over him, and he longed to see it once more; so, selling his claim after a few years stay, he was soon on his way back. Who can tell of the pleasure that he experienced after his arrival. He had only been one of the ordinary inhabitants prior to his departure; but now everything was transposed, and he woke to find himself famous. Old men treated him with deference; young men pointed him out to each other as the hero who had been to far-off lands, and then whispered among themselves as to the amount of gold that he brought back; some had actually seen a portion of it, while those not so fortunate only needed to look at the huge specimen pin in his shirt front, or the ounce ring that he sported on his finger, to realize the tangible wealth that those evidences indicated. And the rosy cheeked girls, how they singled him out and bestowed on him their favors; their partiality was quite a contrast to the time when he grubbed on the farm or hired out to a neighbor for eight dollars a month and board. All this was very pleasant, and he basked in the social sunshine and enjoyed it, but it became very tame after a while. He had intended to have settled down and enjoyed the good things that had seemed, when dreaming in his log cabin, to compass all that was necessary to render the future endurable to him. Now, after the first flush of gratification was satisfied, he began to yearn again for the old free life. The habits acquired during his sojourn in the golden land were too broad to endure the parsimony that characterized his native village, and the social restraint chafed him. He had thought of investing in a village store and settling down to enjoy the dignity that the proprietorship of that institution conferred on one; but even that attainment had lost the charm that his fancy had conferred on it; besides, winter's chill blast penetrated him as it never had before, and he sighed for the balmy air and glorious sunshine of his adopted land. So, paying off the mortgage on the old farm, making the hearts of his old father and mother happy, and bidding an affectionate good-bye to the belle of the village, whose heart he had captured and to whom he made solemn promises of a speedy return, coupled with vows of frequent correspondence, he once more turned his face westward.

Traveling facilities had improved since his first journey, and a month found him back to the old place where fortune had treated him so kindly. How his breast expanded as he drew in the balsamic odors that pervaded the air. The pines swayed in the breeze as of yore; the buckeye shed its white blossoms; the gaudy flowers peeped up and nodded their little heads in welcome, and the old log cabin, chinked with mud, with its quaint stone chimney surmounted with a square of split sticks plastered with adobe, its dirt floor, even the frying pan and bake kettle, seemed more comfortable and homelike than the luxuries that he had left behind. He was soon settled down, prepared to commence the old life again, and with pick, pan and shovel, was prospecting for one of the old-time claims. Somehow, they were not so easy to find as before. It was shallow diggings in that part of the country, and had been pretty well exhausted by this time. To be sure there were plenty of claims that yielded great money; but what was that to one who had abandoned ounce diggings for better claims. He was disgusted with his luck, especially when he thought of that pretty face waiting for him back home, and whose dear little letters made the arrival of the steamer the brightest day of the month. Finally, some of the boys commenced talking about turning the river, and he joined the company. The sawmill furnished the lumber on time, and the storekeeper was accommodating; so, when the water went down, stout hands and willing hearts soon constructed the flume and

pumped out the water. It took time, and the season was well advanced when they finished; it prospected big, and if the rain would hold off a little while their fortunes were made. Alas! the clouds gathered and the rain descended, and away went the flume down the river, leaving the company heels over head in debt, and worse still, discontented. Castles in the air were not realized as before, and he sought consolation in the saloon, and soon became an adept at bean poker. A habit of drinking took possession of him and he craved a stimulant. Thus passed an idle winter, but old habits reasserted themselves, and another season found him delving in the river. They done better this time, and managed to pay off old scores and have a modest surplus left.

Then the Fraser river excitement broke out and away went our hero with the grand army of adventurers. A year's time found him back again, like the majority, broke and disgraced. Whispers of a new El Dorado—silver this time—were rife in the air, and packing his blankets on his back he was soon a full-fledged Washoeite. How he reveled in the excitement of that wonderful period. He was rich, on paper, beyond his sanguine dreams. With what an air he exchanged certificates in the Bobtail, worth \$5,000 a foot, sir, for other equally valuable shares in the Last Chance. Unfortunately he held on too long, and when the crash came he was as impecunious as ever.

Then came Reese river, with the same luck, followed by a trip to White Pine, with no better results. Next a trip to Arizona, the blank, blankest country that fortune ever led him to; thence to Pioche, where he graduated as a fighter, and abdicated again from that role after a desperado made him a target for the contents of a revolver. Since then he has drifted from one camp to another, and has wheeled slag for the past three months in Eureka. Poor fellow; he has grown old since he first started on his travels; rheumatism racks his bones; he has been leached; his hair has turned gray, and the boys do not hesitate to call him an "old stiff." The old folks are dead, and the face that still haunts him, and whose charms he maulders over when he is in his cups, tired long since of his delay, married and forgot him, or thinks of him as gone from the earth. But he will soon be on his way to the Black hills, where he is sure that he will make a stake, and come back and enjoy it at the Bay, which is at present the Mecca of his future pilgrimage. There are some of the old boys down there who have been more fortunate or lucky than himself, and he would like to join them and talk over the days when they pioneered it together. More likely some kind, charitable hand will lay his weary bones at rest in a strange land, and if the news comes back to any of his old comrades they will sum up his life with the often-repeated epitaph, "another one of the old pioneers dropped off." He was harmless enough in this world, and if his idea of Heaven could be realized it would resemble the pine-clad foothills of California, with plenty of good diggings and no Chinamen to ruin the country.

The Black Hills.

A *Chronicle* reporter has had an interview with W. P. Wheeler, from the Black hills, who does not give a very flattering account of the country.

This is the same W. P. Wheeler whose name frequently occurred some six months since in Eastern dispatches relating to the starting from the Black hills of the Wheeler party with "1,500 pounds of gold dust," speculations as to their meeting with Indians, and finally their arrival at Laramie and Cheyenne with "800 pounds of gold dust," and their subsequent departure for the East. After relating to Mr. Wheeler what little he knew of the Black Hills country, and what he had heard and read of the Wheeler party, and asking an infinite number of questions, the reporter was enabled to make the following condensed recital of that gentleman's remarks:

"I was one of a party of nine that arrived in the Black Hills country in March, 1876. I deem myself a practical miner, having had experience in that line in Australia in 1853, and subsequently in California. I went like thousands of others to the Black hills to see what I could see and to make all the money I could. I did considerable tramping around for three months and learned that the district known as the Black hills consists of an oblong clump of hills covering an area of about 100 miles long by from 40 to 50 miles wide. Most of the hills are small, only several reaching to an altitude of from 1,400 to 1,500 feet above the surrounding plains. The hilly district is densely overgrown with tall and shapely black pine trees, many of whose trunks are from three to four feet in diameter. The numerous so-called mines in that country have no names but are numbered. In the month of June, last year, I purchased for \$1,500 what is there called a mine and a half, 450 feet, known as No. 2. It is located one and a half miles from Deadwood City, and within one-half mile of Gayville, on Deadwood creek, which with Whitewood creek forms a junction at Deadwood City. No. 2 was

The Richest Mine

Ever discovered in the hills; there is nothing but placer diggings in that territory. I worked from 20 to 30 men, and have taken out in one day as much as \$1,000. I ran two sets of sluice boxes day and night for several months and at the end of the first 50 days, I remember, I had taken out \$43,000. This created great excite-

ment throughout the hills, and was exaggerated a hundred-fold by the *Pioneer*, the paper published at Deadwood. I sold No. 2 in September for \$3,000, believing that was a big price, for I concluded I had nothing left but dead ground, yet my purchaser was anxious and I didn't object to his \$3,000. I carefully studied the placer diggings of Deadwood and then left the country, believing the whole territory was like many of the old mining districts of California to-day, about 'played out.' As many as 15,000 people visited that country last year; but fully as many returned. Of this latter class you seldom hear, for the Deadwood paper and those at the supply towns along the Union Pacific railroad have always persisted in maintaining

An Ominous Silence.

"There are many more people in the hills who would like to return to the States, but have not the means to even get for themselves the necessary provisions to last them on the tramp of 350 miles to Cheyenne, and are there waiting, Micawber-like, for something to turn up. I advise all my friends to avoid the Black hills. That vast army of idle men have, in their extremity, thoroughly prospected the entire country, but no leads have ever been found; they have found some quartz but not in sufficient quantity to pay for working it. It is the most overrated place I ever saw. Custer City is located on French creek, or what is called French creek, for it is simply a small ravine with no water in it half the time. Formerly Custer City was the principal point of attraction and had 2,000 inhabitants, but now there is scarcely anybody there. It is 80 miles nearer Cheyenne than Deadwood, and is simply a supply town. Crook City, five miles from Deadwood, is on the edge of the prairie, at the foot of the hills, and is the hay market. Hay is \$80 per ton. It is precarious business harvesting the hay, for

The Indians Object to It

And frequently kill the ranchers thus engaged and set fire to their hay. Among the hills is not where the Indians dwell; they regard them with a superstitious awe, because of the frightful and lasting thunder and lightning storms that prevail there. The Indians prefer to live out on the plains. I have seen it stated in the papers interested in having people go to the hills that certain mines have been sold for \$50,000 and \$60,000; but after investigating the negotiations it would be found that \$50 or \$60 was nearer the amounts that were actually exchanged. On our way to the States last September we were not molested by the Indians, but would have been by bands of disappointed white men had we not been in such strong force. We numbered 30, including 15 soldiers, and all well armed. The story about our party having 1,500 pounds of gold dust was considerably exaggerated."

Cerro Gordo Mine.

The *Inyo Independent* says: Aside from the operations on the Union Consolidated mines at Cerro Gordo, there has for a long time been but little work prosecuted upon many of the other prominent mines at that point, for the obvious reason "there's nothing in it." The miner's only show of realizing on the ore produced is through sale to the only party now operating reduction works on Cerro Gordo ores—the Union company; and it is authentically stated that the charges for reduction at the furnace, or, rather, the price paid for ore per ton, amounts to exactly one-half its assay value in all cases—whether that be \$40 per ton, or \$400. Throughout the district, however, there are numerous well-known mines capable of producing in the aggregate rich ore sufficient to supply at least one set of reduction works, and probably several, were they once properly developed. At late convention of the mine-owners of the district, stringent local laws were adopted, which give force to the United States statutes in regard to making proper and legal locations, and as to the annual assessment work required to hold claims. The result is a yearly expenditure which is steadily developing a large number of claims, and, in most cases, proving them to be valuable property. The prime necessity of the mining interest of Inyo, to-day and hereafter, railroad or no railroad, is a reduction establishment on the lake capable of working any and all kinds of ore, on the plan of a custom mill. Such a concern would pay, and, if honestly managed, need never lie idle. Among the outside mines now being worked at Cerro Gordo are the old Osceola and Crowning Glory, on the Belmont side, relocated by Kit Johnson and others, who have struck new bodies of rich ore. The San Lucas, belonging mainly to Rafael Diaz, is working a small force. The Ygnacio, the property of Greenley, Rothschild, et al., now under patent, has been cleared of accumulated waste and made ready for systematic work. The ground adjoining the Union on the south, the property of J. R. Hughes, is undergoing the patenting process. Abe Leyda owns a stretch of patented ground covering the famous Buena Vista, the mother ledge of the hill, the vast croppings of which are plainly visible from the valley. A little further to the south is the San Benito, belonging principally to L. Lasky. It is one of the earliest and richest of the lead locations, the galena of which assays well in gold. Speaking of the presence of the latter metal in Cerro Gordo, there is an old waste dump on ground now covered by the Union title, out of which it is estimated that there has been picked gold nuggets to the value of \$25,000.

Resources of Eastern Oregon.

A correspondent of the *Owyhee Avalanche* says: "The placer mining country of eastern Oregon covers a vast extent of territory. In the early days miners depended on reaping their golden harvest by means of water caused by melting snows in early spring time, and such was the richness of the ground that a month's work amply repaid the hardy miner for the whole year. But as these rich spots became worked out it was evident that snow water would no longer perform the services required of it and some other means must of necessity be resorted to. So many and various ditches were brought in from long distances, carrying good heads of water, thereby enabling the honest miner to work throughout the whole season and retire with a gum-bootful of dust by the time snow flies. Among other enterprises of this nature is the one projected by Mr. Packwood in 1863, and now known as the El Dorado ditch, which is at present 135 miles long, and has cost between six and seven hundred thousand dollars. I think your readers will give me credit for not going in for indiscriminate praise of men of things. In this instance I shall, however, have to turn loose and give Mr. Packwood his just deserts and when my gentle readers (and I wish for none others) see what one man by his foresight and enterprise has performed for the benefit of his country, they will indeed begin to think he has left an indelible 'footprint on the sands of time,' for generations yet to come will profit by his works. This ditch is taken out of Burnt river and runs through a mountainous country the whole distance.

The auriferous gravel belt commences about fifty miles from its head and covers the prosperous mining districts of Bull Run, Rich Creek, El Dorado, goes on to Amelia, Fourth of July, and Mormon Basin canyon, then it crosses over to the Burnt River slope again and covers Devere's Jeff Davis, Cornaut and Clark's Creek. On the top this ditch is seven feet wide, five feet on the bottom, two and one-half feet in depth and has a grade of 178.40 inches to the mile. The carrying capacity of the ditch can be judged when the company can reservoir and sell between 1,500 and 2,000 inches every ten hours, all the time between April and November, at twenty cents per inch for the first head. Some idea of the money the miners have to pay for the use of water during the season, may be formed from the following figures, which are correct in every particular, and what was paid the last season by a few companies: Leatherwood, \$6,000; Campbell and Leatherwood, \$4,000; Linn, \$3,000; Johnston, \$3,500; Kane & Daley, \$2,000. There are five miles of flume along the line of the ditch which will eventually be carried around the gulches and creeks they now bridge. Altogether there are twenty-one large companies taking first water, from one to three hundred inches each. The demand for water far exceeds the supply, but it is only a question of time when the capacity will be doubled, for a new ditch from the Malheur is located and initial surveys have been made. It must and will be *au fait accompli* inside of five years, when the annual receipts, which are now between thirty-five and forty thousand dollars, will be brought up to \$70,000. There are regularly employed from fifteen to twenty men attending the ditch and reservoirs. Last season no breakages occurred after it was put in order in early spring.

There may be said to be five hundred souls depending on this enterprise, for that number would be decreased to as many tens as there are now hundreds but for it. The amount of money taken out and placed in circulation is about \$150,000 annually. The gravel is easily washed, few boulders but can run through a flume, which is a great blessing, for handling rock is expensive and makes many an otherwise good claim run the owners into debt. Hydraulics are universally used, and the diggings vary from five to fifty feet in depth. The gold is of a fine quality, worth from \$16 to \$18 per ounce. It is generally conceded now that there is an ancient extinct river channel running throughout eastern Oregon. Mr. Packwood has given me much interesting information respecting it; from samples of the auriferous cement I have handled and descriptions from those who have traveled and observed, there cannot be much doubt but it is one of the same if not the identical great blue lead of California itself (q. e. d.) Under the El Dorado ditch are beds of cement so hard that it must be blasted; it is then exposed to the climate changes for a few months, then shoveled into sluices. It pays well even by such an old '49 process. Cement mills are talked of; nearly time, too, when \$5 to the pan can be obtained in such dirt.

Mr. W. J. Leatherwood, of the Shasta precinct, owns probably more ground than any other man, outside of California, on the Pacific coast. His enterprises are limited on account of water. Last season he took \$16,000 out of Quartz gulch, situated thirty miles west of Baker City, pays \$6,000 yearly for water on that claim alone and works twelve to fifteen white men regularly. Mr. Cartee here is another of the live go-ahead citizens of Baker county. He is interested equally with Mr. Packwood in the big ditch. In fact he is interested, and left his imprint all over the country.

A NEW FREIGHT CAR.—A freight car built of iron tubes and steel rods by the National Tube Works, McKeesport, Pa., weighs 5,214 pounds, while a wooden car of the same capacity weighs 11,560, both used for the same purpose, and has been running for the past 18 months.

USEFUL INFORMATION.

Steam and Compressed Air.

The following is from a lecture recently delivered in London: In conveying steam to a great distance, although the loss of power occurred through condensation, yet, where the pipes were properly proportioned and protected, no appreciable loss had been found in the pressure at the distance of 1,000 feet from the boiler. The Lime street tunnel of the Liverpool and Manchester railway, having a mean gradient of one in 92, was for many years worked by stationary engines, supplied with steam from boilers situated at a distance of 448 yards (Minutes of Proceedings, Inst. C. E., vol. i., 1841, p. 146). Where steam cranes were kept continuously working, the cost varied from 0.61d. to 2d. per 100 foot-tons, but where the work was below the full capabilities of the cranes it had, in two instances, reached 6d. to 12d. per 100 foot-tons.

As regarded the application of compressed air, the calculations of M. Paul Picard showed that for pressures of from one to 10 atmospheres the efficiency, where the air was not worked expansively, but was admitted for the whole of the stroke, varied from 100 to 39.1, and that, taking into account the efficiency of the machines themselves at 70%, the compounded efficiency was about 50%, although in practice it rarely exceeded 30%. Professor Rankine has asserted that the loss of power seldom amounted to less than from 65% to 75%, while Dr. Siemens had stated that the attainable limit of the useful effect of compressed air was about 50% of the power exerted in compression. Compressed air had been employed for underground haulage at Ryhope colliery, in Durham, by Mr. W. F. Hall, where the cost had been 0.97d. per ton, exclusive of the ropes, which, if allowed, would raise the cost to about 14d. per ton. It had also been used to work coal-cutting machines at Messrs. Baird's works, at Gartsherrie. In this case two and a half cubic feet of steam, at 40 pounds pressure, gave one cubic foot of air at 50 pounds pressure. Compressed air has been used since 1864 in the shops of Messrs. Easton and Anderson, at Erith, where the consumption of coal necessary to produce a given quantity of compressed air was found to be about 69% more than to produce the same quantity of steam at a like pressure.

TO PREVENT THE CLOUDING OF MIRRORS BY MOISTURE.—The laryngoscope has become a very important instrument with medical men. A writer in the *Union Medicate* states that he has by chance discovered a very simple method of preventing the mirror from getting tarnished. This is to pass lightly over the polished surface a cloth moistened with glycerine. The water vapor contained in the expired air is completely dissolved in the glycerine, so that no cloud is formed. This method is thought more practical than that of dipping the mirror in tepid water, or heating at a lamp flame; for first, there is no fear of causing the patient a painful sensation by making the mirror too hot; and second, the polished surface loses very soon, by radiation, the acquired heat, and the cloud is formed before the observation is over. A slight layer of glycerine has not these disadvantages. The writer breathed a quarter of an hour on the glass so treated, without its getting dimmed. Various other applications will suggest themselves. Thus the formation of dew on lenses of astronomical telescopes, which often disturbs observations, might be prevented by a layer of glycerine. Another application is in shaving oneself before a looking-glass, when the glass often gets dimmed with the breath.

A NEW METHOD OF SYNCHRONIZING CLOCKS.—A new method of synchronizing clocks has been introduced by Messrs. Barraud and Lund, of Cornhill, who have had granted them by the postoffice authorities the special use of a system of wires for working it. A narrow slit cut in the dial of a clock admits two projecting pins. They are arranged so as to catch the minute hand at given intervals, and to set the clock to true time. The pins, attached to a pair of slotted levers, connect with an electro-magnet. The mechanism required can easily be screwed into its place, and it remains entirely disconnected from the works of the clock. Any number of clocks varying in size and caliber can, on receipt of one time signal, be simultaneously set to accord with each other in accurately denoting Greenwich time. The Bankers' Clearing House immediately availed themselves of the advantages of a system which will remove the often recurring disputes as to "paying in" within the specified time. Other city establishments will be provided with the apparatus as soon as the postoffice employees are enabled to extend the requisite facilities. The invention must prove a great boon for all mercantile men, and for railway travelers, etc.

USE OF MAGNESIA IN CLARIFYING SUGAR.—Bernard and Ehrman find that the alkalinity of magnesia, and its insolubility in saccharine liquors, fit it for the defecation of fermented cane juice. With a dose of from three to five-thousandths the clarification is complete, and the juice is easily filtered. Any excess of magnesia remains in the scum. Laboratory experiments show an increase of six to seven per cent. in the yield of white sugar, while the quality is not inferior to the best commercial brands. Experiments are to be tried on a larger scale.

Electricity as a Woodman.

We read in an English paper that it has occurred to some ingenious gentlemen in India that artificial electricity may be so applied and controlled as to cut down trees a good deal faster than the clumsy axe or that American notion, the chain saw. The two ends of the copper wires of a galvanic battery are connected with platinum wire, which of course instantly becomes red hot, and while in that state it is gently sawed across the trunk of the tree to be felled. When arrangements were made for the experiment, it turned out that the thickness of the thickest platinum wire that could be got was only that of crochet cotton. It was at once seen that such a wire would be consumed before the tree was half severed from its trunk. However, the attempt was made. The burning wire performed its task very well so long as it lasted, but, as anticipated, the wire continually broke, and at length there was no wire left. There can be little doubt that with a stronger battery and a thicker wire, the experiment would have been entirely successful. As it was the tree was sawn one-fifth through. It is calculated that under proper conditions, a tree which at present takes two hours to fell, will come to the ground by this process in 15 minutes. It is almost needless to add that there is no waste of wood, no sawdust.

PAINTING ON ZINC.—Among recent German inventions is a simple process, depending on the use of acetate of lead, by which every kind of painting is applicable to sheets of zinc. By mixing black lead, for instance, with the salt, a very agreeable light brown hue is obtained. It is by this process that the cupola of the synagogue at Nuremberg has been painted, a sufficient length of time having already elapsed, it is said, to show that the atmosphere has had no influence on the zinc sheeting of the roof, thus showing the adaptability of the process in such cases. By the addition of other coloring matters, light or dark shades of yellow or gray may be produced.

SPONGY GOLD.—The following method of producing spongy or finely-divided gold used by dentists is furnished by the German journal, *Industrieblatter*: Make a solution of gold (not necessarily free from copper) with *aqua regia*; evaporate until the excess of nitric acid is driven off. Then add oxalic acid and carbonate of potassium, in such quantity as will retain nearly all the gold in solution; add an excess of oxalic acid and boil the solution. The gold is then precipitated, while such impurities as copper remain in solution. Carefully wash the precipitated gold until it is entirely free from acid. Dry on a filter paper, and it is ready for use.

THE COST OF MAKING MERCHANT IRON.—A correspondent of the *Pittsburg American Manufacturer* makes a careful estimate of the cost of manufacturing a ton of merchant bar iron in Pittsburg as compared with the cost of manufacture east of the Alleghenies. The items of cost in Pittsburg are given as follows: Pig iron, \$19; coal, \$2.50; ore and scrap, 88 cents; labor, \$12.50; castings, brick and clay, \$1.50; repairs, sand, oil, waste, belting, etc., \$2.20; insurance and taxes, \$1; total, \$39.58; against \$45.76 given as the total cost east of the mountains; or a difference of \$6.18 in favor of Pittsburg.

GOOD HEALTH.

Care of the Hands.

"Paul H. B.," in the *Tribune*, has some special instructions on this subject for the ladies who like to keep their hands fair: Ladies who do their own housework are apt, if they do not wear gloves, to have coarse hands. If they happen to dip them into water, they do not take enough time to dry them well before going on with their work. To wipe the hands perfectly dry after their being immersed in water is imperatively necessary, if they wish their hands to look white. To keep the hands from chapping in cold weather use a mixture of glycerine, one ounce; spermaceti, two drachms; olive oil, two ounces. Mix together, with the aid of heat. Apply this every night, and, if time will admit of it, every morning. In winter, do not wash them in cold or hot water. It should be just blood-warm, and no more or less. Do not go out of doors with them uncovered. In summer, use cold water, unless the hands perspire very much, as the hands of some people do. These latter should use tepid water.

In warm weather, a good preparation for the hands is this: Take half an ounce of powdered alum and the whites of two eggs, and mix together. Then add enough bran to make into a thick paste. Apply this once a day, after washing, and after rubbing the hands together well for a few minutes, wipe off with a soft towel. This will give them a soft, brilliant hue, and check any undue amount of perspiration. What is called cream of roses is also an excellent preparation for the hands, either in winter or summer. It is made as follows, unless you prefer to purchase it at a dollar a bottle. Take compound tincture of benzoin, half an ounce; almond and Malaga oil, of each an ounce; attar of roses, five drops; honey, two ounces; and enough rose water to make the mixture measure six ounces. Apply as often as you like.

Cheese as Food.

We are quite sure that cheese is not given its proper place as a food material. We are aware that some systems do not take to it kindly, and such persons should not press it upon their digestive economy. We are aware also that much cheese because it is poorly made is indigestible. These facts should be borne in mind. And yet as a food possessing great strengthening power and adapted to those who have hard physical labor to perform, there are few foods so satisfactory as rich and well cured cheese. We propose to give some authorities on this point, both for the good of the eater and to contribute toward securing one of our important branches of agricultural production, the demand to which it is justly entitled.

Dr. Austin Flint, one of our most erudite physiologists, says: "Old cheese taken in small quantity towards the close of a repast, undoubtedly facilitates digestion by stimulating the secretion of the fluids, particularly the gastric juice." Here its effect is attributed to a different principle than that of its fermenting quality; but an active ferment may also increase the effect of the gastric juice. Dr. Flint says: "New cheese is a highly nutritious article, as is evident from its composition."

The long experience of English, Scotch and Irish laborers proves cheese to be a wholesome as well as nutritious food. A small quantity of cheese, with them, takes the place of a larger quantity of meat, and enables them to endure such hard labor as the American thinks he can only perform upon a generous meat diet. In Germany farm laborers depend largely upon the curd of milk after being skimmed for butter. This curd is frequently used in a fresh state and makes an important part of the laborer's diet.

It is related of a certain Dane that he could carry a stone so heavy that it required 10 men to lift it on his shoulders; that he performed such wonderful feats of strength upon a diet consisting of large quantities of thick sour milk, tea and coffee. His enormous strength must have been sustained by the curd of the milk. This case refutes the common error, that milk does not furnish a diet for vigorous manhood. There are numerous cases in which a milk diet has sustained the system under the most exacting labor. Wm. Vincent, of Stonington, Ct., in a letter to Dr. Alcott, says: "I have lived principally on bread, cheese, and butter, with a few vegetables, for more than 24 years." He entirely abstained from animal flesh.

The American Encyclopedia says: "The peasants of some parts of Switzerland, who seldom ever taste anything but bread, cheese and butter, are a vigorous people."

Our American women take to little nitrogenous food, owing, perhaps, to their great predilection for the finest flour and much pastry. Their vitality is confessedly much lower than the better class of English women. Women are not such flesh eaters as men, and with their love of sweetmeats the nervous system becomes ily nourished. They may almost be said to be made of starch and sugar. If they would make cheese a more constant article of diet, and use more unbolts flour, with more open air exercise, they would soon become the most healthful and robust, as they are now the most beautiful women in the world.

Cheese is less liable to putrefactive change than flesh, and thus much less likely to develop in the human system those scrofulous diseases attributed to animal food.

WARM WATER FOR BRUISES.—The *New York Medical Journal* reports the case of a man who, while engaged in a machine shop, had his hand badly crushed. While his hand was on the anvil of a trip-hammer, the hammer (weighing 700 pounds) fell. It so happened that a file was on the anvil, and thus the force of the hammer was arrested about half an inch before it reached the bed. It was found that the whole palm of the hand was a mass of pulp. The metacarpal bones were comminuted extensively, and there was apparently but small chance of saving the hand. It was, however, placed in hot water, and kept there for two or three weeks, and then taken out and dressed. In three months the patient was sufficiently well to leave the hospital, and now, nine months after the accident, he is able to use the fingers, and has quite a useful hand. Bruises and injuries do much better when treated with hot than with cold water. The temperature should be about 103° Fah.

EFFECTS OF DISEASED TEETH.—Everything seems to urge people to proper care of their teeth. At a meeting of the New York Odontological Society, Dr. J. Marion Sims, commenting on the value of dental knowledge to the physician, remarked: As to the effect of diseased teeth upon the general health, I wish medical men generally could be better educated on that point. We are all familiar with the fact that decayed teeth frequently cause neuralgia; and this is the extent of medical education on the point. They usually do not recognize the fact that, as a general thing, decayed teeth, teeth with inflamed alveolus, with matter exuding from around the teeth, are the means of producing more nervous disorders, more terrible consequences to the general health than almost any other thing that can happen.

POISONING BY LEAD.—A case of lead poisoning, which recently occurred in France, was traced to the pewter foil used to cover Roquefort cheese. The pewter contained 12 parts of tin, 85 parts of lead and three of undetermined matter.—*New Remedies*, vi, 96.

MINING SCIENTIFIC PRESS

W. B. EWER, SENIOR EDITOR.

DEWEY & CO., Publishers,

A. T. DEWEY, GEO. H. STONG,
W. B. EWER, JNO. L. BOONR.

Office, No. 224 Sansome Street, S. E. Corner of California Street, San Francisco.

Subscription and Advertising Rates:

Advertising Rates.	1 week.	1 month.	3 mos.	12 mos.
Per line.....	25	80	\$2.00	\$5.00
Half inch (1 square).....	\$1.00	\$3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Four weeks are rated as one month. Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

Subscriptions in Advance.—Postage paid—one year, \$4; six months, \$2.25; three months, \$1.25. Remittances by registered letters or P. O. orders at our risk.

Write for the Mining and Scientific Press. We invite not only professional men, but practical miners and mechanics to contribute to our columns. All communications will be kindly treated. Authors, as well as readers, will be benefited by corresponding.

Address all letters to the firm, and not to individual members, or others, who may at any time be absent from our office.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:

Saturday Morning, April 21, 1877.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Arizona; Changes of Level in the Earth's Surface; Mechanical Ore Concentration and Separation.—No. 30, 241. Mining Experiments; The Coming Industrial Exhibition; Items of Interest from the Mines; The Hydraulic Mines, 243. Early History of the Eastern Slope.—No. 4; Excavating by Machinery, 249. Patents and Inventions, 252.

ILLUSTRATIONS.—Marysville Buttes Before and After the Earthquake of 1866; The Wilcox Conical Valve, 241. The Price Excavator, 249.

CORRESPONDENCE.—Mills and Mines at Pioche, Cherry Creek and White Pine in Eastern Nevada; Spanish Belt and Philadelphia or Belmont Mining Districts, 242-243.

MECHANICAL PROGRESS.—Suggestions for Iron Planers; Encouragement for Inventors; Transmission of Power by Shafts and Ropes; American Manufacturing Progress; Cheap Electric Light and Power; Unloading Grain Cars; Removing Scale from Boiler Tubes; Immense Cable, 243.

SCIENTIFIC PROGRESS.—Soils and Geology; Gold Metallurgy by the Wet Process; Influence of Forest on Climate; Naphtha Wells in Russia; Laboratory Manipulators, 243.

USEFUL INFORMATION.—Steam and Compressed Air; To Prevent the Clouding of Mirrors by Moisture; A New Method of Synchronizing Clocks; Use of Magnesia in Clarifying Sugar; Electricity as a Woodman; Painting on Zinc; Spongy Gold; The Cost of Making Merchant Iron, 247.

GOOD HEALTH.—Care of the Hands; Cheese as Food; Warm Water for Bruises; Effects of Diseased Teeth; Poisoning by Lead, 247.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends; Review of the Stock Market for the Week, 244.

MINING SUMMARY from the various counties in California, Nevada, Arizona, Colorado, Idaho and Utah, 245-52.

GENERAL NEWS ITEMS on page 252 and other pages.

MISCELLANEOUS.—The Old Pioneer; The Black Hills; Cerro Gordo Mines, 246. Resources of Eastern Oregon; A New Freight Car, 247. South African Mines; Drainage of Mines; Gould & Curry Water; Standards of Weight and Measure, 250.

NEW ADVERTISEMENTS.

Salamander Felting Company, S. F.; Little Giant, R. H. Hoskin, Dutch Flat, Cal.; Wood Workers, Bentel, Margard & Company, Hamilton, Ohio; Assessment Notice—California Fruit-Growing Association.

ASBESTOS.—The Salamander Felting Company, of this city, Seward Cole, Manager, advertise in another column that they will purchase asbestos, if they can procure a good quality. Parties having mines of this substance will do well to correspond with Seward Cole, 317 California street. The fibrous quality is that which is desired, but that having the appearance of soapstone, or with a very short fibre, is not salable. They will buy it by the ton, if of good quality. It is worth all the way from \$25 to \$50 per ton, according to quality. The quality like the Italian is worth \$100 per ton for manufacturing clothing, but there is not much of that here.

As soon as a mine turns out rich or some one wants to buy it, along comes somebody and says he owns it or part of it. The latest instance in point is that of the Peck mine, in Arizona. Wm. M. Lent is said to have bought it for \$400,000; and now comes Wm. Cole, of Prescott, Arizona, and says he has instituted suits to recover an undivided 900 feet in each of the two claims constituting the 3,000 feet of the mine.

BELLEVILLE.—The Virginia Chronicle says: "Mark Ezekiel's has just returned from a trip to the mining district of Belleville, and gives a most discouraging account of the situation in that section. The place is described by him as overdone, and the sight of disgusted adventurers packing their blankets out of town is quite frequent."

The North American company, at Shady Run, says the Dutch Flat *Forum*, have discharged all of their white men, with the exception of the bosses, and the mine is now being worked by Chinamen. The mine is looking well, but the principal part of the gold taken out is coarse. The supposition is that John will save the company any further trouble of declaring dividends.

Mining Excitements.

The Black Hills and Arizona.

Ever since mines were first discovered on this coast there have been periodical "excitements" about new mines, which have had the effect of drawing off a number of miners, prospectors and adventurers in search of the new El Dorado. In the early days of California men have left diggings which were paying them more in a day than they ever before earned in a month, and gone to new fields further off in hopes of bettering themselves. Gone with no preparation whatever, no knowledge of the country and perhaps with only enough means to get them there. Of course in such cases disappointment was the share of the many and riches of the few. The hope of being of that few, however, led men on to go at all hazards, and in the face of all obstacles. They believed all that was said in favor of the locality, and thoughtlessly put aside any attempts at advice of more careful people. There is still a large class of nomadic prospectors in the mining community looking and hoping for "49 diggings," who are ready to go anywhere, no matter how far away, or in how dangerous a place, with little thought about the matter except that they expect to strike it rich. Nine-tenths of them fail to make any calculation as to what will happen in case they do not strike it rich, and probably about that proportion fail to do so. The consequence is that a great deal of suffering is entailed by want of forethought. Advice in such matters is, however, generally thrown away, as even those who have been "through the mill" will go and do the same thing over again with like results.

There are just now two sections which are attracting the attention of this class of the mining community; one is the Black Hills and the other Arizona. A great deal of attention is being turned in both directions, and both excite the hopes of prospectors the more because they are a long distance from here and the sections are new. The reports circulated give glowing accounts of the mineral richness of the respective sections; both have sent out or bullion away in sufficient quantities to prove that there are some mines, at least, paying well; in each the Indians still roam about as proof that civilization has not advanced far there, and the population is scant, so there is plenty of room for the prospector and settler. The surroundings of both localities are such as to suit exactly the class of men who usually pioneer the way into new countries, and the prospectors who open up new mining regions.

The general state of mining affairs on this coast at present is such as to leave many miners out of employment. This is particularly the case on the Comstock, the most populous mining locality on the coast. A large number of these men are looking towards the Black Hills or Arizona, and already numbers of them are on the way to one place or the other. Still more are waiting and preparing to go. Those who intend going, however, should by no means go unless they have money sufficient to support them while there and enough to bring them out if unsuccessful. This is only prudent, and the people with whom we have conversed, who have been to either the Hills or Arizona, agree that neither place should be visited by them without means.

The reports from the Black Hills are conflicting in many respects as regards richness and extent of the mining region. They all agree that it is a pretty hard country for a poor man. It is estimated that there will be a population there this summer of from 12,000 to 15,000 men. The country is new, sparsely settled, and is scarcely calculated to support such a population. Some of them who go will no doubt be disappointed, and all should be prepared in case they are among the unfortunate ones. Miners who are expecting to depend on striking good claims or on obtaining employment for subsistence while there will be apt to see pretty hard times if some of the accounts are correct. Those who have means, however, and no employment here, are in a position to take the chances, but poor prospectors better stay where they are.

In Arizona the same state of affairs exists. That there are such mines there is no doubt, but that everybody who goes there will find one is doubtful. A large immigration is coming into the country, attracted by the reports of rich mining regions, but, unfortunately, many are going to have no means of support unless they obtain employment. We have conversed with several persons from different parts of the Territory, all of whom agree as to the richness of the mines; and agree also in advising persons without means to stay where they are for a while.

The reasons for this are obvious. Although many of the mines are rich there are few reduction works in the Territory, and in all the camps the miners are waiting for capital to help them out. No mines are developed enough to need any miners, and employment in all branches is scarce. Labor can be procured in many places for \$1 per day because men are so hard up, and there is no doubt but that many who are going there now will have to leave again this summer. In brief the country is not yet in a position to support the class of population going there. The local papers unite in advising men without capital to stay away for the present, telling them beforehand that there are more

men now there than can find work, and those coming to look for work will find hundreds already there in the same predicament.

It is only acting the part of discretion for men who are intending to go to either of the places we have mentioned to weigh carefully the aspects of the case before starting. Once there without money pretty hard rubs will result. Those who are now at work, or have any kind of chance to make a living, had better stay where they are and leave Arizona and the Black Hills alone. This is our advice and the advice of persons who have been in both the sections referred to.

The Coming Industrial Exhibition.

Preparations for the coming Industrial exhibition under the auspices of the Mechanics' Institute are progressing favorably, and the exhibition promises to exceed in interest all preceding ones. The managers expect a better display of exhibits than usual, as mechanics and manufacturers in these dull times have more leisure to devote to the preparation of such matters. A number of applications for space have been received from Eastern manufacturers, so that our own people must look to their laurels and show what we can do at home. Several Eastern manufacturers who realized material benefits from their exhibits at the Centennial intend sending a good display here for the coming fair. All the details of the exhibition are being quietly arranged by the managers so that everything in that line is well advanced. The premium list this year enumerates 623 medals and \$1,557 in cash, besides extra and special premiums.

We have received from J. H. Culver, Secretary, a photograph of one side of the new design for the medals to be awarded at the forthcoming exhibition. Drawings for the same were solicited from artists and designers here, and among those submitted the one by Messrs. Mayers & Stott was deemed the most appropriate and artistic. The design has been carefully studied, and is admirably worked out. Trade and commerce, art and science are effectively symbolized on the obverse. A female figure, crowned by accessories indicative of the Golden State is represented bestowing a laurel wreath on a kneeling mechanic. Her left arm rests on a shield bearing the arms of the city, and in her left hand is the caduceus of Mercury. Her head-dress is that of a Bacchante, and at her feet are the offerings of Pomona. A manufactory with smoking chimneys, a puffing locomotive, a Corinthian capital, an anvil, an atlas, a plow, a toothed wheel, a sheaf of grain, and a few open books fill up the spaces around the figures. In the background is the Golden Gate, through which a merchantman, with all sails set, is passing. Above is the star of Empire, and a bear's head to typify the State is introduced beneath the general design. The reverse of the medal contains a wreath with a suitable lettering. The medal will be struck off by the designers. It is to be of bronze, and three inches in diameter.

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective Superintendents on file at the offices in this city:

The ore at the Grand Prize mill assays in pulp from \$100 to \$120 per ton. The main shaft of the mine is progressing slowly on account of heavy flow of water.

In the Justice mine the ore stopes from 800 to 700, including 750-foot level produce an increase of gold in the bullion product.

Five days' run on company work at the Eureka (G. V.) mill last week resulted in 220 ounces of amalgam.

The new air boxes in the Jefferson give good ventilation throughout the mine.

The Leopard mill has been started up on ore from the mine.

In the Crown Point mine they are approaching the ledge on 2000-foot level very cautiously for fear of an overflow of water. The face of the drift is now in a mixture of soft clay and porphyry of a copper color, with some quartz which assays from \$4 to \$5 per ton.

The 1650-foot level of the Con. Virginia continues very hot.

The water still hovers about the 1600-foot station of the Hale & Norcross.

In the Manhattan they are finding some good ore in the 517-foot east drift, but not enough to justify opening a stope.

Very rich rock has recently been struck in a drift of the Soggs mine, Nevada county.

BY INDIAN POWER.—Up in Upper Austin, H. H. Cooper is running a two-stamp quartz mill, with which he works small lots of rich ore. The Reveille says these reduction works are of one-Indian power—Captain Joe, a noted Piute chieftain, being the motive power. Lo! the poor Indian, who has come down from his high estate, and no longer hunts the ferocious jack-rabbit to his lair, but pursues the ignoble avocation of turning a crank for a two-stamp quartz mill. Truly, the American Indian has degenerated.

The Southern Pacific railroad will be at the Colorado river probably within a week.

The Hydraulic Mines.

A Short Water Season—The Debris Question.

From Mr. H. S. Jacobs, who has lately visited several of the more active hydraulic mining localities in the State, we have been able to gather some items touching the present condition and immediate outlook of that industry. The light body of snow now lying on the Sierra Nevada precludes the possibility of the season of active operations being extended late into the summer, except perhaps in a few localities. Even with the present large facilities for water storage, and the most careful use thereafter, the period of summer washing must be curtailed by several weeks, and, in most cases, by a much longer time. It is said that there has not been so little snow on the mountains in the middle of April for twenty years past; and, although the furnishing ditches have thus far been kept full, some of the higher reservoirs are far from being yet replenished, and it is doubtful if they will be entirely stocked this summer. With so little snow on the Sierra,

The Usual Summer Freshet Cannot Occur.

And the agricultural lands in the lower valleys will this year escape material addition to the tailings already deposited upon them. Indeed, the beds of the streams above have, by the filling-up process, been extended over such a breadth of surface that nearly the whole of these tailings remain along their channels in the mountains, the water being now spread out into such a thin sheet that it operates with too little force to carry any but the finest silt into the plains below. As the beds of the mountain streams fill up, they not only grow every year wider and wider, but become, also, more impacted, rendering the deposits of debris along them less liable to be disturbed and carried down by ordinary freshets; and there is little doubt but they will, through the operation of these causes, be placed, in the course of a few years, almost wholly beyond the disturbing power of even the extreme floods. In this view of the matter, the farmers may have less cause for apprehension in the future than many of them now suppose. For the present,

The Hydraulic Companies

Are not only economizing their water but are making the most of their time, every one employing a full force of hands and running without intermission where they have water in steady supply. The North Bloomfield company, having at last bottomed their channel, are washing gravel of very high grade, running over 3,000 inches of water. Their clear monthly profits range from fifty to seventy-five thousand dollars, and as they operate with but little interruption, their net revenues for the year will be very large. Much of their ground would pay well to drift, but as the company will now be able to dispose of their gravel at a rapid rate, they will hardly have recourse to this method of mining, which, where companies are without water a good portion of the year or perhaps financially straightened, may be resorted to with advantage.

The Eureka Lake and Middle Yuba Canal Co.,

Another of the great enterprises on the San Juan ridge, are also running a large amount of water and will make a good summer's work. The reservoirs and water catchment of this company exceeds in dimensions and extent any other in the country, and it is likely that they will, notwithstanding the prospective drought, have water enough to keep their own mines in steady supply throughout the year, besides furnishing a considerable amount to their usual customers. At Columbia hill, where the leading mine of this company is situated, the system of sluices and undercurrents have been planned on a vast scale, and in their arrangement are perfection itself. The management here is also distinguished for efficiency and skill, nearly the whole of this immense property having for more than twenty-five years been under the present directory.

Various Smaller But Prosperous Enterprises.

The Boston company, running 1,000 inches of water, have just completed a 1,500 foot tunnel through which they will for many years find outlet and ultimately be able to bottom their claim, which covers one of the richest sections of the Pliocene river channel that here crosses the country in great strength. Last year a cave occurred in the main pit of this company, which for a long time seriously interfered with their operations. The mass of barren pipe clay brought down by this cave having been run off, they are now washing very rich gravel, which promises to improve steadily downward. At Snow point and at Woolsey's flat, and also at Blue Tent, Omega and Quaker hill, on the other side of the South Yuba, washing is being carried on day and night, and a fair summer's work will be done. At Blue Tent the English company are using 1,000 inches of water, and having at last gotten their entire property in good shape are likely to make money hereafter. At Quaker hill, Jacobs & Sargent run about the same amount of water, and have an immense body of gravel which after 20 years steady washing shows scarcely a perceptible diminution.

Early History of the Eastern Slope—No. 4.

Still Hanking After a Slice of California.

By the Organic Act, erecting the western half of Utah into a separate political division, to be called the Territory of Nevada, provision was made for annexing thereto an area of some twelve or fifteen thousand square miles belonging to California, provided that State should by an irrevocable act cede the same to the new Territory. This extensive tract lay on and beyond the eastern declivity of the Sierra Nevada, comprising what is now the counties of Alpine, Mono, and Inyo. Afterwards a delegation from Nevada, headed by Governor Nye, visited California, and appearing before the Legislature, urged that body to take favorable action on the subject, but without avail, the proposed measure failing to meet with popular approval.

Officials Provided For.

The Organic Act made provision for a Governor, Secretary, Attorney, Marshal, Surveyor-General, a Chief Justice and two Associate Justices, to be appointed by the President of the United States. Also, for a Legislative Assembly, to consist of a Council and a House of Representatives, and a Delegate to Congress, all to be chosen by the lawful electors of the Territory, every free white male inhabitant of the United States, above the age of twenty-one years, who had been a resident in the Territory at the time of the passage of the Act, being allowed to vote at the first election. Although the question of

free soil had already become a great national issue, and was fiercely agitating the two leading parties in the East, no allusion was made to that subject in the Organic Act. While the institution of slavery was not therefore excluded from the Territory by law, there does not appear to have ever been a slave permanently within its borders, nor was any determinate effort ever made to plant the institution there.

The New Advent.

Although the Organic Act received the approval of the President on the 2d day of March, 1861, not until the month of July of that year did the Federal appointees arrive in the Territory. These officials consisted of James W. Nye, Governor, with S. C. Gallaher, his Private Secretary; Orion Clemens, Territorial Secretary, accompanied by his brother, Samuel Clemens, (Mark Twain) Assistant Territorial Secretary; Benjamin B. Bunker, Attorney-General; John W. North, Surveyor-General; George Turner, Chief Justice; Gordon N. Mott and Horatio N. Jones, Associate Justices, no Marshal having at first been appointed. Besides these official personages there came out from the East with Governor Nye several other gentlemen, the most of whom were soon after, either by him appointed or by the people elected to some official position, the duties of which, it is but just to say, were generally discharged faithfully and well.

Census Taken and an Election Ordered.

As soon as he arrived in the country, Governor Nye, in accordance with the requirements of the Organic Act, caused a census of the Territory to be taken, Dr. Henry Degroot having been appointed to supervise that business. Although but ten days were allowed for completing this work, yet with such diligence and energy was it conducted that not merely an enumeration of the inhabitants was effected but much other statistical information was collected in this brief space of time, the census returns showing that there were eleven thousand white inhabitants in the Territory in the month of July, 1861.

A Legislature Chosen and a Full Code of Laws Enacted.

The census having been completed an election was ordered by the Governor, to be held on the 31st day of August for choosing members of the Legislature and a Delegate to Congress, on which occasion a full complement of members were elected to both branches of the Legislature, John Cradlebaugh having been chosen Delegate to Congress. Meeting on the first day of October, the Legislature proceeded to frame and enact a very full and excellent code of laws, modeled pretty closely after those of California, adjourning at the end of sixty days, to which period their session had been limited by the Organic Act.

The Machinery Perfected.

The Legislature having created the usual number of county and town officers, these were duly filled at an election held January 14th, 1862. The parties so elected having qualified and been installed on the 10th day of February following, the inhabitants of this region so long distracted and given over to anarchy, enjoyed for the first time a complete code of laws with all the machinery and functionaries necessary for insuring their vigorous enforcement. And so matters remained until 1864, when the wealth of the country having been greatly multiplied and its population increased to some forty thousand, the people at an election held for the purpose of considering the question of adopting a State form of government, determined to change their political status from a Territorial dependency to

A Sovereign State,

Which measure having been consummated through the recognition of Congress, the Territory of Nevada was superseded by the State of Nevada, with such official changes as the new order of things required, no other alterations of importance having been made in the existing code of laws. The first Governor chosen for the new State was Henry G. Blaisdel; James W. Nye and Wm. M. Stewart having been elected United States Senators, and Gordon N. Mott Representative in Congress.

Disputed Boundary—Conflict of Jurisdiction.

For a long time much uncertainty had existed as to the exact position of the boundary line between California and the territory of Nevada. Out of this uncertainty there occurred in the month of February, 1863, a conflict of jurisdiction that for a time threatened to lead to violence between the local authorities of the two

Excavating by Machinery.

A city genius once condoled with a farmer because all the ground in the country was wrong side up and he had to turn it all over before anything would grow. It might also be a subject of regret that so much ground is put by nature in the wrong place, so that so much time and money must be expended in getting it into its right location. This is doubly true when men have to do the moving of earth with plows, shovels, wheelbarrows and wagons, for then it costs a good deal of money to move a little dirt. We saw something in Oakland the other day which promises to throw aside all these expensive apparatus and labor, and we were so interested in the working of the machine that we have secured an engraving of it, as may be seen on this page. It is in brief a machine which digs and shoulders its own load, and then runs off and dumps it and returns for another in a fraction of the time in which half a dozen men could throw the same quantity of earth upon a wagon. But we propose to be more definite than this, both in the description of the machine and the work which we saw it doing.

First, to describe the machine:

It is the invention of Jacob Price, Esq., of the Price Press Company, and was patented through Dewey & Co. It is totally unlike other machines made for a similar purpose, differing from them widely in principle, construction, appearance and operation. It is, in

and discharged in one second, also without stopping. Indeed, there is no necessity for stopping during an entire day's work, either for loading or discharging.

The work which we saw doing in Oakland last week was the grading of a large lot down to the level of the street and delivering the earth in a low spot about 800 feet distant, thus making two well graded blocks from two which were very much out of grade. There were six of the machines working in a circuit, which was 1,600 feet long. We timed these machines and found that the complete circuit from the point of dumping to this point again was between six and seven minutes. The machines were of different sizes. Some carried two yards of earth at a load, and were drawn by four horses. Making a trip in six minutes, 10 in an hour, and 100 in a day of 10 hours, it would move off 200 yards of earth in the working day. This is rapid work, and at 15 cents a yard, the lowest rate for excavating, a machine would earn \$30 per day. Quite a notable feature of the work was the ease with which the horses did the work. It was between three and four in the afternoon when we were at this place and yet the horses were fresh and active as the most exacting teamster could desire, although they had kept up the rate of excavating which we have mentioned since morning!

The value of the machine may be clearly seen when we state some facts from the actual working of it in the hands of Mr. Price. He took a job of excavating upon which the lowest bid by contractors working with plows, shovels, scrapers, teams, etc., was \$9,000. Mr. Price put his price at \$4,000 and cleared \$2,000 on the job. The job at which we saw him at work was taken by a contractor at 16½ cents a yard. The time was dull and the contractor took it low to keep his men at work, expecting to get

merely wages out of the job. It was a hard piece of earth and the contractor gave it up, saying he could not make horse-feed at it. Mr. Price took the job at 15 cents per yard for cutting (nothing for filling), and is moving dirt rapidly and will do very well on it beyond doubt. We noticed one other point at the work and that is that the deposited dirt is packed down nearly as hard as a roadbed by the constant passage of the machines, which with their weight and broad wheels produce the effect of repeated rolling. This is, no doubt, a point of considerable importance in the making of roads, trackways for railroads and levees.

The machines are built by the Price Press Company, at the well known works of the Sweepstakes Plow Company, at San Leandro, Alameda county, where the implement will be shown to all who are interested. The city office is with Baker & Hamilton, 17 Front street, San Francisco, where one of the proprietors, Mr. I. J. Truman, may be interviewed concerning the machines.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from prominent mines have been as follows: Modoc, April 9th, \$4,855—total to date, \$29,483; Tybo Con., 10th, \$14,279—to date, \$27,714.10; Washington, 11th, 344½ ozs. bullion; Comanche, 10th, \$8,347.42; Northern Belle, 10th; \$7,073.94; Modoc, 11th, \$4,957—total to date, \$34,340; California, 14th, \$231,612.26—total to date, \$657,705.70; Con. Virginia, 14th, \$43,572.89—total to date, \$169,851.66; Northern Belle, 12th, \$8,920.93; Grand Prize, 12th, \$7,928.77; Modoc, 13th, \$5,180; Modoc, 15th, \$4,926.52—total to date, \$44,724.70; Con. Virginia, 17th, \$52,667.66—total to date, \$222,519.32; California, 17th, \$185,169.54—total to date, \$842,875.24; Northern Belle, 15th, \$15,405.32; Tybo, 14th, \$13,473.95. Total this month, \$41,188.05.

UNITED STATES ENGINEERS COL. MENDELL and Prof. Davidson, and T. J. Arad, Engineer of the Harbor Commissioners, have presented to the latter body a voluminous report and detailed maps of a new water front line for this city, which they recommend. According to the plan suggested by this report, there will be a new line of water front, extending 13 miles around the city, with a sea wall and new wharves. East street will be lengthened and made much wider than at present, so that a double track for steam cars can be laid, connecting the shipping with the railroad depot at Fourth and Townsend.

ABOUT 60 tons per week of Silver King ore are shipped from the mine in Arizona to this city.

CHAS. H. KOHLER, an old resident of Gold Hill, and for many years Chief Engineer at the Yellow Jacket mine died last week.

THE PRICE EXCAVATOR.

countries. Assuming that Plumas county extended over the fertile and somewhat populous region of Honey Lake valley, the officers of that county undertook to enforce there the laws of California, which was stoutly resisted by the authorities of Roop county, wherein the disputed district was situated.

Being unable to adjust their difficulties on a satisfactory basis, both parties, after recourse had to various processes and much legal finesse, proceeded to arm themselves, and a bloody encounter would probably have ensued had not a heavy fall of snow just then prevented the sheriff of Plumas county making his way over the Sierra into the hostile camp on the other side. Meantime the Legislature of California, now that affairs had reached a crisis, passed a law authorizing the Surveyor-General of the State, acting with a commissioner, to be appointed on the part of Nevada Territory, to survey and definitely locate the boundary line between the two countries. Subsequently a joint commission was appointed for this purpose, it having been agreed that the claims of Nevada should be respected until such time as the boundary was finally fixed, and which, when it came to be accomplished, determined the most of the disputed territory to be in the State of California and within the limits of what are now Plumas and Lassen counties.

MINING DECISION.—The Secretary of the Interior on the 17th, in the case of the Philadelpha Lode vs. the Pride of the West, Del Norte, Colorado, held that the contestant in mining cases has no right of appeal from the decision of the Commissioner of the General Land Office. The only party entitled to appeal is the one who files an adverse claim in time, and commences suits thereon, within 30 days from the date of such filing. This decision is at variance with former decisions of the Department, but it is in accord with decisions which have been made for the past year.

fact, a three-wheeled cart, the box being hung low down between the two hindwheels. The forward wheel is a caster wheel, turning freely in any direction and allowing the machine to be turned around in a circle ten feet in diameter. All the wheels are wrought iron, with cast iron hubs and steel tires, and with the exception of the "off" or right-hand wheel, have nothing peculiar about them. The one excepted, however, has a tire 12 inches wide and five-sixteenths of an inch thick, with the spokes set well over the outer edge of it. The inside of the tire is divided up into buckets or pockets, by blades of iron about 10 by 12 inches, one of which is bolted to each spoke. Beneath the box and just inside of the elevating wheel above described, is an ordinary plow, throwing its furrow on the inside of the wide tire into the above mentioned buckets. In other words, the earth is plowed into the wheel and by it carried up and emptied into the earth box. A moment's reflection will show that the buckets are in a proper position to hold the dirt, except when at or near the top of the wheel, where they are of course bottom up, or nearly so, causing them to discharge their contents. At the top of the earth box is a horizontal distributing wheel, driven by the spokes of the "near" hind wheel. This wheel serves to keep the earth level, and make it fill the box chock full in every corner. The load is discharged by turning the three bottom planks on their edge, by means of the lever shown on the left hand of the driver. The lever on the right, is for raising or lowering the plow.

The method of operation is as follows: The elevating wheel and the "off" horses travel in the furrow. The driver lowers the plow, and the box commences to fill, requiring less than a minute to take a full load. When the box is full the plow is raised, without stopping the team, and the load is driven where it is wanted

South African Mines

The following notes on the mines, climate, etc., of South Africa, published in the *Helena (Montana) Independent*, were prepared by the United States Consul at Cape Town, South Africa, W. W. Edgecomb, in reply to enquiries made by E. W. McGrath, of Helena. The letter accompanying these notes is dated Cape Town, January 13th, 1877, and the writer suggests that no persons go to that country unless they are liberally supplied with means:

Answer to Mr. McGrath's Questions:

Gold mining in Transvaal is principally confined to the Leydenburg gold fields and the Marabasta gold fields. The former has at present about 400 miners digging for alluvial gold. Rich gold-bearing reefs have lately been discovered by a Mr. Armfield, who proposes to form a company and import quartz-crushing machinery. The last-named district is principally confined to the crushing of gold quartz by an English company, under the management of Colonel Wetherby. Besides these, gold has been found in many other places within a radius of a few hundred miles, which proves the Transvaal republic to be a gold-yielding country.

Besides gold, there has been discovered cobalt, lead, copper, coal and other minerals. The two former are worked by companies in the districts of Marao and Middleburg. The country as yet has been so little explored that at present we can only with certainty say that it is a country rich in minerals, but cannot specify the deposits or localities except as above mentioned. It is the general opinion at the Leydenburg gold fields that richer gold deposits will be found about 100 miles north from the present gold fields.

Water has not been over abundant at the gold diggings, except during the summer; at the same time it cannot be called scarce, there being the Sabi river running through—or nearly so—the Leydenburg gold fields. During the past year the miners have made several water races, which seem to answer the purposes, so that lately we have heard very little grumbling about scarcity of water.

A miner's claim (so far as my knowledge goes), is 100 yards square, for which he pays to the government 10 shillings sterling per month. A prospector's claim, or to one or more persons who discover a gold-bearing reef or a gold field, is 150 yards square. As an example: Mr. Armfield and three more miners who discovered the last gold-bearing reef, received as remuneration 1,000 square yards of the best part of the reef, selected by themselves. I have heard that they received even more ground; but I am not certain, therefore I quote the lowest.

There are one or two tent-house hotels at the Leydenburg gold fields, where the charge for board and lodging is about 10 shillings per day. As a rule, the miners do not make use of hotels, but have their own mess. I quote the price of provisions as follows: Beef, six pence per pound; mutton, six pence; corn meal, from 40 to 50 shillings per 200 pounds; maize (generally used for the diggers' Caffirs), 20 to 30 shillings per 200 pounds; potatoes, 20 to 30 shillings a bag. Vegetables abundant at middling figures; the same with fruit. Many miners, particularly those that camp near the river, have their own gardens.

Wages.

I only know of one large claimholder who engaged men to work for him, and he paid 50s per week and free board and lodging, and then they only staid with him a few weeks, until they had saved a few pounds and commenced to work for themselves.

Miner's Outfit.

I believe that all that a miner usually requires, that is to say for the alluvial gold diggings, can be bought in the several South African seaports and towns as cheap as in any other country, and I have no doubt that diggers' tools and clothing can be bought in the gold fields, where there are several stores filled with merchandise.

The Transvaal Republic

Has a white population of at least 30,000, the greater part of whom are Dutch farmers, so there will always be food in abundance, and as it will become worth their while to offer their produce for sale in the markets of the gold fields, the necessities of life will be lower in price. The same as was the case in the diamond fields, where cornmeal is now selling at about 20s per 200 lbs.

The Transvaal people have had a war with a Caffir chief, Succone, during the past months, but it is nearly at an end, or will be so within a very short time. It is difficult to say whether any more disturbances with the negroes will break out. I do not think it, however. During this last war, which was only from 50 to 100 miles from the Leydenburg gold fields, the miners were never disturbed, neither by one nor the other of the war parties. In fact, the miners received messages from the Caffir chief that they need not fear of any raid upon them, as he did not wish to make bad friends with the Europeans. Consequently, only the most timid miners left the diggings during the war. As a proof of how mild our Caffir wars are, I may mention that during these eight months of warfare with the Caffirs, there were not more than 15 white men killed and a few wounded. At the same time every man should be prepared for an emergency.

Route to the Leydenburg Diggings.

For persons of limited means, and who do not particularly desire to visit other South African

sea ports, I should recommend taking ship direct for Delagoa bay, and from there walk up to the gold fields, a distance, at the utmost, of 150 miles. There is an open road between Delagoa bay and the gold fields, and guides and native carriages for baggage can be procured at the seaport. For persons who wish to see other parts of South Africa before going to the gold fields, I would say, come first to Cape Town, and proceed with the Union Company's mail steamer from Cape Town to Delagoa bay, visiting Port Elizabeth and Natal on the route.

Railway.

There is a railway to be built between Delagoa bay and Transvaal. Ten ship-loads of railway material have already arrived at Delagoa bay. The climate in all parts of South Africa is good.

Drainage of Mines.

Colorado's New Law on the Subject.

The *Colorado Miner* gives the following new State law of Colorado on the drainage of mines:

SEC. 1. Whenever contiguous or adjacent mines upon the same or upon separate lodes have a common ingress of water, or from subterranean communication of the water, have a common drainage, it shall be the duty of the owners, lessees or occupants of each mine, so related, to provide for their proportionate share of the drainage thereof.

SEC. 2. Any parties so related, failing to provide, as aforesaid, for the drainage of the mines owned or occupied by them, thereby imposing an unjust burden upon neighboring mines, whether owned or occupied by them, shall pay respectively to those performing the work of drainage the actual cost and expense of doing such drainage, to be recovered by an action in any court of competent jurisdiction.

SEC. 3. It shall be lawful for all mining corporations or companies and all individuals engaged in mining, having thus a common interest in draining such mines, to unite for the purpose of effecting the same, under such common name and upon such terms and conditions as may be agreed upon; and every such association, having filed a certificate of incorporation, as provided by the eighteenth chapter of the revised Statutes of Colorado, shall be deemed a corporation, with all the rights, incidents and liabilities of a body corporate, according to the provisions of the aforesaid statute, so far as the same may be applicable.

SEC. 4. Failing to mutually agree, as indicated in the preceding section for drainage, jointly, one or more of the said parties may undertake the work of drainage, either by sinking a pump shaft or by running an adit, after giving reasonable notice, and should the remaining parties then fail, neglect or refuse to unite in equitable arrangement for doing the work or sharing the expense thereof, they shall be subject to "an action therefor," as already specified, to be enforced in any court of competent jurisdiction.

SEC. 5. Whenever the mines thus drained are in possession or being worked by lessees, and such lessees have no property or effects out of which the judgment for drainage may be satisfied, the plaintiff bringing his action for damages shall be entitled to a writ of attachment in aid of his said action, upon filing an affidavit, showing that said lessees have no property out of which the judgment for drainage may be satisfied.
